## **FOREWORD**

When we attained Independence in 1947, we took over a country whose economic development had been impeded and even arrested by almost two centuries of foreign domination and continuation of feudal relationships. Under the leadership of Jawaharlal Nehru and inspired by his vision and noble ideals, the country adopted the method of planned development based on modern science and technology to move towards the attainment of social justice. Through a series of Five-Year Plans, major changes have taken place in our economy and society and the country has become largely self-reliant. Foundations have been laid for building the edifice of socialism. In this, the third Volume of the Gazetteer of India entitled "Economic Structure and Activities", an attempt has been made to tell the story of transition of an old civilization to a new nation, of the change from the traditional to a modern economy.

The contributors to this Volume are men of distinction in their chosen fields. They have lent to this work the benefit of their profound scholarship. I hope this Volume of the Gazetteer will be welcomed by all who are interested in the economic life of the people and the impressive strides our economy has made since Independence, in spite of many hazards and obstacles.

Social Welfare and Culture

## PREFACE

We are happy to present the third volume of the Gazetteer of India whose theme is the economic structure of India and all activity pertaining to the economic sphere. This volume, like the previous volumes in the series, follows an entirely new scheme of treatment which is more systematic and more informative than the relevant volume of the Imperial Gazetteer of India. There were only 10 chapters in the volume "Economic" of this series and a chapter each had been devoted to such subjects as posts and telegraphs, railways and roads, famines and forests. All these subjects have now been dealt with in a more systematic manner under appropriate chapter headings. The present volume consists of 19 chapters which cover almost all important aspects of our economic life. Besides a survey of the country's natural resources, this volume deals with such important topics as community development, banking and money market, external resources, consumption and welfare, plans and prospects, etc. In the preceding volume on 'History and Culture' we have dealt with some aspects of economic life up to 1947. In the present work we take note of manifold developments in different spheres of economy after independence.

In view of the importance of this volume for a developing country like India, the Central Advisory Board for Revision of Gazetteers appointed a sub-committee of eminent economists to prepare the draft plan. Prof. V. K. R. V. Rao was the Chairman of this committee. The other members were Shri Asok Mitra, Dr. Bhabatosh Datta and Prof. B. D. Bhargava with Editor (Gazetteers) as Member-Secretary. The plan drawn up by the Sub-Committee was submitted to the Advisory Board which accepted it with minor modifications. Eminent scholars in different fields were appointed as contributors to the various chapters of this volume. We are grateful to them for sparing time in spite of their pre-occupations for contributing to the volume. The pace of economic development was so rapid that the facts recorded in the chapters became outdated in a very short period. The chapters, therefore, had to be revised and brought up-to-date as far as possible. At the suggestion of Prof. S. Nurul Hasan, Chairman, Advisory Committee for Revision of Gazetteers, a chapter was added at the end to take note of the latest developments in our economy. Shri E. P. W. da Costa has kindly gone through the volume updating the contents at several places.

The economy of India in 1947 was in poor shape. While production, particularly in the agricultural field, had suffered a decline, the rate at which the population had grown in the three decades prior to independence was noticeably rapid. No attempt had been made to tap and

## PREFACE

mobilize land resources and as village industry had decayed, artisans switched over to agricultural labour in large numbers. The country's agricultural economy received a severe jolt following partition, as productive areas were transferred to Pakistan. The situation was aggravated further by the inflow of millions of displaced persons from Pakistan into the country. All around, there were shortages of foodgrains, cotton and jute, to cite a few instances. Thus, Indian economy, to quote Prime Minister, Smt. Indira Gandhi, sought "to bridge, in a matter of decades, the gap created by a century and more of stagnation". The national economy had to be rebuilt from scratch through a series of Five-Year Plans.

Planning for over two decades between 1950-51 to 1972-73 has yielded dividends. This can be seen in the doubling of the net domestic production. The infra-structure for economic development — through water and power, transport and science and technology — has been strengthened. Foreign exchange reserves, which were as low as Rs. 298 crores in mid-sixties, showed an encouraging rise, touching the figure Rs. 1,056 crores in July, 1974. There has been a great rise and a noticeable diversification in industrial production, of products ranging from simple consumer goods to a variety of sophisticated machinery manufactured indigenously. The public sector plays a dominant role with increasing investment in Central Government undertakings. The 1970-71 record in the output of foodgrains, 108 million tonnes, was almost double that of the output in 1950-51, which was 56 million tonnes. In spite of the food deficits in 1973, due to the failure of monsoons, the per capita availability of foodgrains has been more than maintained. The following pages unfold the story of the struggle of an emerging nation in a state of transition from the traditional to modern economy.

I would like to take this opportunity to thank Prof. S. Nurul Hasan, Minister of Education, Social Welfare and Culture, Shri K. N. Channa, Education Secretary, and Shri Mohan Mukerji, Additional Secretary, Department of Culture, who have been taking keen interest in this work.

## PLANNING FOR ECONOMIC DEVELOPMENT

### I. Concept of Planned Economy and Welfare State

In India the movement for political advance was always linked up closely with ideas of social and economic development; and the national leadership was conscious of the importance of planning for raising standards of living. Leading public men like Dadabhai Naoroji (1825-1917), M. G. Ranade (1842-1901) and R. C. Dutt (1848-1909) wrote and spoke extensively on social and economic problems. Their main theses were the growing poverty of the people and the recurrence of famines which they attributed to the defective land revenue policies of the government, the cost of administration, deficits in the balance of payments, and generally to policies framed not in the interests of India but those of Britain. It was their considered view that no solution could be found for the social and economic backwardness of India by the British Government pledged to a policy of *laissez-faire*, but that only a national government which actively promoted development by direct government action could bring about improvement in living standards.

As part of the Montague-Chelmsford Reforms following the First World War, 'nation-building' activities like local self-government, agriculture, co-operation and education were entrusted to ministers responsible to provincial legislatures. But this constitution worked only in some of the provinces and, even in those, no national policies could emerge owing to financial and other limitations. Further constitutional discussions followed with the Simon Commission and during the Round Table Conferences. The resolutions of the Indian National Congress from 1929 onwards emphasized the need "to make revolutionary changes in the present economic structure of the society and to remove grave inequalities in order to remove poverty and ameliorate the condition of the masses." A resolution passed in 1931 stated that "political freedom must include real economic freedom of the starving millions" and set out the fundamental rights which, from this point of view, should be included in the Constitution.

The Government of India Act of 1935 introduced provincial autonomy. This led to the formation of Congress governments in eight Provinces. Soon after this, in August, 1937, the Congress Working Committee passed a resolution suggesting that an inter-provincial committee of

---

\* This chapter was originally written by late V. T. Krishnamachari in 1966.

experts should be set up to consider "urgent and vital problems, the solution of which was necessary to any scheme of national reconstruction and planning" and "to suggest how and in what order those should be tackled". This was followed later in the year by the constitution of the National Planning Committee of which Jawaharlal Nehru became Chairman. The Committee consisted of 15 members including well-known industrialists, economists, financiers, professors and scientists in addition to representatives of the provincial governments (the non-Congress Provincial Governments of Bengal, the Punjab and Sind also co-operated) and those of the Indian States of Hyderabad, Mysore, Baroda, Travancore and Bhopal.

Jawaharlal Nehru has reviewed the work of the Committee in *The Discovery of India*. Though the view was held that "planning under a democratic system should be considered not merely from the point of view of economics but cultural and spiritual values and the human side of the life", and that "such planning could only take place in a free National Government strong enough to be in a position to introduce fundamental changes in the social and economic structure", it was found that the Committee could formulate useful programmes by considering each individual problem in concrete terms. The Committee decided that it would be practical to aim at a minimum increase of 200 to 300 per cent in 10 years, of the per capita national income as it then stood—Rs. 65 for the country as a whole and somewhere around Rs. 35 for rural areas. Along with this, certain important objectives were borne in mind—increase in agricultural and industrial production; reduction of unemployment; liquidation of illiteracy; increase in public utility services; provision of medical facilities and increase in the average expectation of life. Emphasis was laid on heavy and basic industries as strategic factors for the development process. From the point of view of employment, it was felt that cottage industries should also be encouraged. The improvement of agriculture, which was the mainstay of the people, had necessarily to be given high priority.

Twenty-nine subcommittees were formed to deal with specific problems. In these were about 350 members, many of whom were specialists in their subjects. The work of the Committee was interrupted when the war broke out and many of the members including the chairman were arrested. Between 1940 and 1945, the Committee had only a nominal existence. A series of valuable reports were, however, published which brought together the constructive thinking done by the Committee and the subcommittees and the material collected in the course of their work. The importance of the National Planning Committee lies not so much in these reports as in the wide interest it created throughout the country in co-ordinated planning as the only means of bringing about a rapid

increase in standards of living and its emphasis on the need for fundamental changes in the social and economic structure.

In the course of the war, serious short-comings became apparent in the country's economy, and in June, 1941, the Government of India took up the consideration of plans for post-war reconstruction. It was, however, only in 1944 that a Planning and Development Department was created under a separate member of the Viceroy's Executive Council, for organizing planning work in the country and co-ordinating it. More than 20 panels of experts were set up and the Central departments and the Governments of Provinces and Indian States were invited to prepare detailed plans for industrialization. It was estimated that about Rs. 1,200 crores would be available as resources for plans. The plans actually put forward were estimated to cost Rs. 1,300 crores. When planning had advanced and sufficient experience had been gained, the Government of India found it necessary to explain to the country their industrial policy. Accordingly, the 'Statement of Government's Industrial Policy' was issued on April 26, 1945.

This was an important pronouncement, as the last one to be made by a government responsible to the Secretary of State for India. It marked a complete departure, as a result of the lessons of the war, from the policies followed until then. The statement began by pointing out how the continuance of the existing policy of *laissez-faire* would not meet the objectives of sound post-war development.

"Though industrially stronger than in 1939, India will find herself in a position of relative inferiority. In other countries technological advance has been immense and, as a result of the nature of modern warfare, there has been a striking increase in the total volume of skilled industrial labour. If India is to make rapid headway and if the standard of living of the masses is to be effectively raised, a vigorous and sustained effort is necessary in which the State no less than private industry must take part."

It then proceeded to say: "The Government of India have decided to take positive steps to encourage and promote the rapid industrialization of the country to the fullest extent possible. They attach particular importance to the development of those industries which constitute the foundation of modern industrial life, such as iron and steel industry, the heavy engineering industries, the machine tool industry, the heavy chemical industry and so on. But while the development of these industries must take high priority, it must form part of a balanced plan in which due place is given to consumption goods industries. It is clear that if progress is to be achieved, the development of industry must be planned by Government in co-operation with industry and every effort made to make the

**Plan effective.** Industrial development, however, cannot stand itself. There should be balanced development in industry, agriculture and the social services and inside the field of industrial development a balance should be kept between the manufacture of capital and consumer goods."

The resolution then pointed out that important industries must be brought under 'central control' in the interests of co-ordinated development. Twenty industries were specified including iron and steel, aircraft, ship-building and marine engineering, heavy machinery, heavy chemicals and fine chemicals, cotton and woollen textiles, cement, etc. In addition to ordnance factories, public utilities, generation of electrical power and railways, which were largely State-owned and State-operated, basic industries of national importance could be promoted by the State if found necessary. The State was also to have the power to license industrial undertakings, the object being to prevent concentration of industries in certain areas and to divert private capital to schemes deserving priority. The resolution finally envisaged controls for the achievement of the following objectives:

- "(i) to secure balanced investment in industry, agriculture and the social services;
- (ii) to secure for industrial workers a fair wage, decent conditions of work and living and a reasonable security of tenure;
- (iii) to prevent excessive profits to private capital;
- (iv) to ensure the quality of industrial products in the interest of both internal and external markets;
- (v) to ensure that unhealthy concentration of assets in the hands of a few persons or of a special community would be avoided: 'this may be secured by a judicious exercise of controls, such as capital issues control and the licensing machinery for the regionalization of industry';
- (vi) to acquire necessary technical training of personnel and to extend the benefit of such training to minorities and backward communities".

The Planning and Development Department was abolished in 1946.

When the Government of India was formulating these policies, prominent industrialists of Bombay published a plan in 1944 in which they envisaged the doubling of per capita income over a 15-year period and an outlay of Rs. 10,000 crores. The Bombay plan recognized that during the period of planning, controls might have to be instituted similar to those which were in force under war conditions. The plan also defined the respective fields of ownership, control and management of economic enterprises by the State. In its view, State ownership should have a place in two categories of cases: "(i) where the State finances an

enterprise which is important to public welfare and security, and (ii) where the State ownership is a necessary means of enforcing State controls". As for the planning organization, it proposed that a national planning committee representing different interests should be set up to prepare a detailed plan and that the execution should be the responsibility of a supreme economic council under the Central Government.

In October, 1946, the Government of India appointed a committee called the 'Advisory Planning Board' to review the planning that had already been done by the government, the work of the National Planning Committee, and other plans and proposals for planning and to make recommendations regarding the future machinery of planning and also in regard to objectives and priorities. This Board made recommendations for the setting up of a Planning Commission and its composition and functions.

Prior to independence, there was thus a large measure of agreement in the nation—the Government of India under the Secretary of State, the Indian National Congress, prominent industrialists and others on the following principles: (i) There should be central planning, in which the State should play an active part, for social and economic development to bring about a rapid rise in standards of living; (ii) There should be controls and licensing in order, among other things, to direct investments into the desired channels and ensure equitable distribution; (iii) While there should be balanced development in all sectors of the economy, the establishment of basic industries was specially important. In this, State-owned and State-managed enterprises have an important role. There were, however, differences of approach in regard to the specific fields to be allocated to the public and private sectors.

The plans prepared by the Government of India, the Bombay industrialists and others suffered from serious limitations. When they were prepared, it was known that transfer of power was to take place quite soon; but the exact form of the future government was not known. The plans consisted largely of proposals of experts which were not effectively co-ordinated. They had no social philosophy behind them. With the advent of independence, they become inadequate, though the thinking that had taken place on planning generally and its techniques was useful for the future.

**Constitutional Background:** Though the Constituent Assembly met in December, 1946, its real work, apart from the 'objectives resolution' began after the discussions in regard to transfer of power were concluded. These discussions eventually resulted in independence on 15th August, 1947 on the basis of the separation of the predominantly Muslim areas in the eastern and western regions and their formation into a separate unit, Pakistan. After partition, elections in the areas that constituted

India were completed and the newly elected representatives joined the Constituent Assembly. With the advent of Independence, the Constituent Assembly became a sovereign body representing the people of India, with functions exactly the same as those of the Constituent Assemblies in other countries. The Constituent Assembly had to face more complicated problems than similar assemblies in other countries in the past.

There were the difficulties inherent in the framing of a constitution which would meet the needs of over 360 million people differing in race and religion and speaking different languages, and with standards of living among the lowest in the world. Such a constitution had, besides, to bring into a common political and economic framework the 'Provinces' and the 'Indian States'. Moreover, the war had made a deep impact on India. India had recruited, trained and sent nearly two million men to the several theatres in the war—'the largest volunteer army in history'. Supply missions and operation commands for South-East Asia were established and worked all through the war in the country. India had thus a crucial role in the war efforts in this region. Owing to these causes, the economy of the country was subjected to serious stresses and strains and inflationary pressures were generated. More than this, there was the ferment in people's minds. Hopes and aspirations were raised for a better social order due to the war aims proclaimed by the Allies—pronouncements like the Atlantic Charter (August, 1941) and the Philadelphia Declaration (May, 1944) gave promise of intensive efforts by governments for promoting plans for social security, raising human dignity and improving welfare. Moreover, while the talks for the transfer of power were in progress, grave communal disorders occurred in parts of the country in the wake of partition which involved the loss of many lives and the uprooting of several millions of people from their homes in the western and eastern regions, creating intractable problems of resettlement and housing.

These incidents shook the nation to its depths. An extremely difficult human problem faced the Constituent Assembly—how to assist the revolutionary urges and hopes and aspirations for a better life felt by over 360 million people to find constructive expression in a free society. Everywhere in Asia and Africa and other under-developed regions, there was a resurgent nationalism, with people taking pride in their past history and achievements and seeking to take an equal place among the free nations of the world. This had its economic side also. These nations saw the steadily widening gulf between their living standards and those of the developed countries. They were not prepared to accept this state of things as inevitable. They knew that science and technology could assist them to modernize their economies and were determined to make efforts to achieve, in a comparatively short period, rates of growth which took a much longer time in the past.

In the case of India, there were also other factors mentioned already—its special part in the war, the coming of independence and the aftermath of partition. Further, the stage of development India had already reached held out hopes of much more rapid advance than ever before. Reviewing the entire situation, in the light of the social philosophy evolved over decades as already explained, the Constituent Assembly came to the conclusion that to guide this 'revolution of rising expectations' into constructive channels, India should make determined efforts, through carefully planned large-scale social and economic development and the application of modern scientific and technological improvements, to bring about a rapid and appreciable rise in the standards of living of the people, with the maximum measure of social justice attainable. Solutions for the pressing problems of resettlement of displaced persons—while the Constituent Assembly was in session between five and six million persons had come into the country in the western and eastern regions—and of demobilized army personnel, the rehabilitation of the economy run down by the war and the economic dislocation due to partition could be found only in this wider setting. In other words, India should become a welfare State.

The provisions of the Constitution have been described elsewhere. It is sufficient here to bring out three of its features which are important for national planning. First, 'Economic and social planning' is a concurrent subject. Also, in framing lists of 'Union', 'State' and 'Concurrent' subjects and the other provisions, the Constitution vests power in the Union to ensure co-ordinated development in essential fields of activity while preserving the initiative and authority of the States in the spheres allotted to them. Secondly, the Constitution includes provisions for promoting co-operation on a voluntary basis between the Union and the States and among States and groups of States in investigation of matters of common interest and in legislative procedures and in administration, thus avoiding the rigidities inherent in federal constitutions (Articles 249, 252, 257, 258, 258-A, and 312). In other words, the objective is co-operative federalism. Thirdly, the Constitution also sets out in broad outline the pattern of the welfare State envisaged and the fundamental principles on which it should rest.

**Pattern of Welfare State :** The importance attached by the Constituent Assembly to the inclusion in the Constitution of basic ideas on the pattern of the welfare State which the nation should establish can be seen from the long discussions that took place on the relevant portions of the Constitution: the Preamble, Fundamental Rights (Articles 12 to 35), Directive Principles of State Policy (Articles 36 to 51), and the special provisions for Scheduled Castes and Tribes and Backward Classes (Articles 330 to 342). The keynote was struck in one of Jawaharlal Nehru's speeches

in the Constituent Assembly. In this, the two sides of this problem were emphasized. The first was that India should move into the modern world of science and technology for bringing into existence a social order in which there could be a rapid rise in standards of living with equitable distribution and equality of opportunity. The second was that the new social order should be built on the foundations of, and derive its strength from the nation's cultural heritage. The Preamble set out the basic objectives of the new social and economic order which the nation had 'solemnly resolved' to bring into existence, viz., to secure to all its citizens 'Justice, social, economic and political; Liberty of thought, expression, belief, faith and worship; Equality of status and of opportunity and to promote among them all Fraternity assuring the dignity of the individual and the unity of the Nation.' The Fundamental Rights and the Directive Principles of State Policy set these objectives out in greater detail.

While the Preamble emphasized the development of a free society based on the dignity of the individual in which there would be equality of status and opportunity and justice, social, economic and political, Article 38 defined the aim as follows: "The State shall strive to promote the welfare of the people by securing and protecting as effectively as it may a social order in which justice, social, economic and political shall inform all the institutions of the national life". In Article 39, stress was laid on the right to adequate means of livelihood equally for men and women (Article 39-a); equal pay for equal work for both men and women (Article 39-d); conditions of work ensuring health and strength (Article 39-e) and protection of children and youth against exploitation and against moral and material abandonment (Article 39-f). It is also laid down that the State should ensure that 'the ownership and control of the material resources of the community are so distributed as best to subserve the common good' (Article 39-b); and that 'the operation of the economic system does not result in the concentration of wealth and means of production to the common detriment' (Article 39-c).

The duty is enjoined on the State that 'it should within the limits of its capacity make effective provision for securing the right to work, to education and to public assistance in cases of unemployment, old age, sickness and disablement, and in other cases of undeserved want' (Article 41). The State should also 'secure just and humane conditions of work'; and 'secure to all workers—agricultural, industrial and otherwise—work, a living wage, conditions of work ensuring a decent standard of life and full enjoyment of leisure and social and cultural opportunities' (Articles 42 and 43). Particular stress is laid on special assistance to the weaker sections of the people, including the Scheduled Castes and Scheduled Tribes, with a view to promoting their educational and economic interests and to protecting them from social injustice and all forms of exploitation. In

regard to the rural economy, Articles 40 and 48 enjoin the application of modern scientific methods to agriculture and animal husbandry and the implementation of programmes and improvements through self-governing panchayats. Article 43 requires the promotion of cottage industries on an individual and co-operative basis.

The only Article in which a definite time limit has been fixed is Article 45 under which 'The State shall endeavour to provide, within a period of ten years from the commencement of this Constitution, for free and compulsory education for all children until they complete the age of fourteen years'. The programme laid down in this Article is of vital importance to the nation.

These general principles were given a more precise direction when Parliament accepted in December 1954 the socialist pattern of society as the objective of social and economic policy. The Second Five-Year Plan report explains this approach to planned development in the following terms: "Essentially, this means that the basic criterion for determining lines of advance must not be private profit, but social gain...Major decisions regarding production, distribution, consumption and investment—and in fact all significant socio-economic relationships—must be made according to social purpose. The benefits of economic development must accrue more and more to the relatively less privileged classes of society, and there should be progressive reduction of the concentration of incomes, wealth and economic power. The problem is to create a milieu in which the small man...is enabled to put in his best in the interests of a higher standard of life for himself and increased prosperity of the country .. The accent of the socialist pattern of society is on the attainment of positive goals, the raising of living standards, the enlargement of opportunities for all, the promotion of enterprise among the disadvantaged classes and the creation of a sense of partnership among all sections of the community. These positive goals provide the criteria for basic decisions..." India's Five Year Plans follow and are based on these principles.

Important principles of public social policy are embodied in Article 31 as amended. As India's Plans envisage a large extension of State activity in the economic field, the reconciliation of the claims of property with those of the community is left to Parliament in each case of nationalization on its merits. Assurance has been given in Parliament that the basic principles of 'justice, equity and good conscience' would guide the Union and State Governments in fixing compensation. Moreover, laws coming under the following categories cannot be called in question on the ground, among others, of property rights being infringed:

- (i) land reform laws for defining tenancy rights, modifying rents, etc;
- (ii) company reform laws containing provisions for modifying rights

of managing agents, secretaries and treasurers, managing directors, etc.;

- (iii) laws for extinction or modification of rights under lease of minerals or mineral oil where such rights impose undue burdens on the community or are opposed to national interests in any other manner; and
- (iv) laws for the taking over of property by a State for a temporary period in the public interest to secure proper management.

Laws falling under these heads have an important place in programmes for social and economic welfare. Their aim is to prevent abuses and bring about institutional and other changes which are essential for speeding up the pace of development.

## II. The Planning Commission

**Composition and Functions:** The industrially advanced democracies in North America and Western Europe have accepted the idea of planning, in some form or other, in order to secure high rates of economic growth. In all of them, planning is restricted to specific fields and has limited objectives: and the planning authority advises governments responsible to Parliaments. In Communist countries, there is comprehensive planning of the entire economy and the planning body has a dominant position, as an integral part of the executive machinery, with power to supervise implementation. India's plans cover a wider field than the plans of the advanced democracies though they are less comprehensive than those in the Communist countries. The planning body in India is advisory and plans have to be accepted by Parliament before they become effective. Implementation also rests with the Union and State Governments. Planning in India has thus distinctive characteristics of its own. India has, therefore, to find by a process of trial and error its own solutions to questions of democratic planning—the composition of the Planning Commission and its relations with the Cabinets in the Union and the States—and strike its own balance between liberty and progress, central control and private initiative and rational planning and local authority.

The Planning Commission was established by an order of government in March, 1950 which defines its functions. The order says:

“The Planning Commission will

- (i) make an assessment of the material, capital and human resources of the country, including technical personnel, and investigate the possibilities of augmenting such of those resources as are found to be deficient in relation to the nation's requirements;

- (ii) formulate a Plan for the most effective and balanced utilization of the country's resources;
- (iii) on a determination of priorities, define the stages in which the Plan should be carried out and propose the allocation of resources for the due completion of each stage;
- (iv) indicate the factors which are tending to retard economic development, and determine the conditions which, in view of the current social and political situation, should be established for the successful execution of the Plan;
- (v) determine the nature of the machinery which will be necessary for securing the successful implementation of each stage of the Plan in all its aspects;
- (vi) appraise from time to time the progress achieved in the execution of each stage of the Plan and recommend the adjustments of policy and measures that such appraisal may show to be necessary; and
- (vii) make such interim or ancillary recommendations as appear to it to be appropriate either for facilitating the discharge of the duties assigned to it; or on a consideration of the prevailing economic conditions, current policies, measures and development programmes; or on an examination of such specific problems as may be referred to it for advice by Central or State Governments".

The Planning Commission consists of the Prime Minister as chairman, the Finance Minister and the Minister for Planning and some other Cabinet Ministers on a part-time basis and also full-time members. There is also a deputy chairman whose main function is to co-ordinate the work of the Commission. The deputy chairman is usually a full time member without parliamentary duties though there have been exceptions. The Commission works in close touch with the Union and State Cabinets and with full knowledge of their policies. At the same time, it is an autonomous body entitled to form its own views on important issues and place them before the governments. The Commission is also invariably consulted on changes proposed in social and economic policies. To ensure free and full exchanges of ideas, the Planning Commission has established a convention that it will not give publicity to differences of views between the Commission and the Union and State Governments. The link with the Union Cabinet also exists at the secretariat level. The Planning Commission is part of the Cabinet organization and the 'demand for grants' for the Planning Commission is included in the budget demand for the Cabinet Secretariat. The Commission has a staff of Secretaries and Advisers and also a research organization.

The duties assigned to the Planning Commission in the order quoted

above bring out the scope of the continuous studies it should undertake. It is obvious that, in important sectors, the Commission will have to plan for longer periods than five years and fit the five year plans into these long range programmes. Example of such sectors are: (i) General education based on free and compulsory education for boys and girls of age 6 to 14 upto and including university education, technical education of all grades and manpower requirements of projects and programmes; (ii) Assessment of natural resources, land and water resources, mineral resources, etc. and their conservation and utilization; (iii) Financial resources—internal and external—and price levels and consumption patterns; (iv) Studies of demands for commodities and products based on the anticipated growth in national income and other factors. Perspective planning has thus a major role and its techniques have to be progressively improved. The Commission has also to evolve criteria for fixation of priorities and the reconciliation of competing claims. It should also scrutinize projects and programmes from the economic and financial points of view. Other studies it has to undertake are:

- (i) Policy reviews: The broad strategy of the Plans should be worked out along with long-term objectives and economic, fiscal, and other policies on which they should be based. Policies should also be worked out in regard to individual sectors of the economy.
- (ii) Institutional changes and social change: Studies should be made of changes in the social order which are needed—land reforms, labour laws, etc., and of the changes that have to be brought about in attitudes and outlook.
- (iii) Public co-operation: Studies should be made of the steps which should be taken for making the people feel a sense of participation in the Plans so that efforts on a national scale might be made for their implementation.
- (iv) Administrative machinery: The changes in the administrative structure needed from time to time for efficient implementation of the Plans should be studied.
- (v) Appraisal of progress: There should be appraisal of progress achieved from time to time with an analysis of the factors which hinder development. The Commission should recommend such adjustments of policies and improvements in administration as may be needed to secure successful implementation.
- (vi) Evaluation and research: There should be evaluation of results from time to time; and research should be organized to study social and economic results of legislative measures and for other connected purposes.

In its work, the Commission obtains the assistance of the Union and

State Ministries including their technical experts. It has evolved arrangements to ensure that in the formulation of proposals for plans and in working out policies and programmes, consultations take place continuously with the Union and State Ministries, the Reserve Bank of India, organized bodies in different sectors and panels of experts as detailed below :—

- (i) **Union and State Governments:** Consultations take place at the secretariat level as well as at the level of members of the Commission and Ministers. There is very close touch with the Ministry of Finance and Economic Affairs and the Reserve Bank of India. The Planning Commission has three 'Programme Advisers', senior administrative officers to whom groups of States are assigned. They visit the States and discuss the working of the plans with officials and Ministers, explaining to them the Commission's points of view and resolving difficulties.
- (ii) **Conferences of States' Ministers and meetings of Advisory Committees to Union Ministries:** The members of the Commission attend conferences of States' Ministers (Education, Health, Co-operation, Agriculture, etc.) convened by the Union Ministries concerned. They also attend the annual conference of Development Commissioners at which the working of the community development movement is discussed. The members of the Commission also attend the meetings of the Advisory Committees attached to Union Ministries.
- (iii) **Consultative Committee of Parliament:** Parliament constitutes a Consultative Committee consisting of about 80 members to be in touch with the Commission at all stages commencing from the stage of formulation of the plan. The Planning Commission meets the Consultative Committee frequently. Arrangements for consultation with parliamentary Committees at the stages connected with the formulation of the plan are dealt with later.
- (iv) **Panels:** The Commission has set up panels consisting of the best persons available in different fields both within and outside government, to advise it on general questions of principle and policy. There are now a panel of economists, a panel of scientists, and also separate panels of persons qualified to advise on agriculture, land reforms, education, health and housing. These keep the Commission in touch with the best thinking in the country on the different subjects.
- (v) **Federation of Industries:** All-India boards, etc. The Planning Commission keeps in close touch with the Federation of Indian

Chambers of Commerce and Industry and other representative organizations for industries and commerce. It also meets representatives of all-India boards for discussions—the Khadi and Village Industries Board, Handloom Board, Handicrafts Board, etc.

- (vi) **Experts from other countries and the World Bank Missions:** The Commission also has the advantage of discussions on planning problems with delegations from other countries, the representatives of the United Nations agencies, the United States A.I.D. experts, experts obtained under the Colombo Plan, etc. The opportunities it has of detailed talks with the missions sent by the World Bank to review the progress of India's economic development from time to time are also of great value to the Commission in its work.
- (vii) **Universities and other research institutions in India:** The Commission is assisted in its work by research and other work done in research institutes, attached to Universities or working independently, which examine general issues connected with planning and important aspects of India's plans and publish books and papers on them. Eminent economists from other countries are often associated with these institutions in research on problems in which they have special interest.

The Planning Commission prepares the plans for the Union and the States. The plans show the financial resources available and their allocation among the different sectors of the economy both in the Union and the States with details of the projects. The Planning Commission also prepares plans for important industries in the private sector, co-ordinating them with those for industries in the public sector and those for small scale industries. Plans are prepared for five year periods. The First Plan was for the period April ~~1, 1951~~ March 31, 1956, the Second Plan for April 1, 1956—March 31, 1961 and the Third Plan for April 1, 1961 to March 31, 1966. Plans, once published, are revised as conditions change. Every year, annual plans are prepared for the Union and the States after reviewing progress made and taking into account the latest revised financial prospects—internal and external. The annual plans are incorporated in the Union and State budgets and are passed by Parliament and State legislatures. Similarly, the private sector plans are also revised from time to time as conditions change in regard to likely demand and availability of raw materials and of internal finance and foreign exchange. Planning is thus a continuous process. The Commission prepares progress reports and advises Union and State Ministries on the working of plans. It also undertakes evaluation of projects and programmes, and organizes research.

States have their own planning arrangements. In every State, there is a Cabinet Committee which is in close touch with the preparation of the plans and the manner in which they are carried out. This committee is assisted by a committee of officials working under it for co-ordinating plans made by different Ministries and supervising implementation. In many States, there are Advisory Committees of non-officials consisting of members of Legislative Assemblies and others whose advice is likely to be useful. The Planning Commission has made suggestions for strengthening the planning organizations in States, as they should undertake larger responsibilities for the preparation of long-term plans in fields of development in the subjects allocated to them and economic and technical investigations and also watch implementation and publish progress reports. The need for adequate arrangements for planning at district and block levels, including preparation of village plans, has also been stressed.

Mention should be made here of the National Development Council which was established in 1952. This Council consists of the Prime Minister (Chairman), the Chief Ministers of all States and the members of the Planning Commission. The Union Ministers in-charge of subjects that come up for discussion are also invited to attend meetings. The functions of the Council are: (i) to consider the proposals formulated for plans at all important stages and accept them; (ii) to review the working of plans from time to time; (iii) to consider important questions of social and economic policy affecting national development; and (iv) to recommend measures for the achievement of the aims and targets set out in the national plan, including measures to secure the active participation and co-operation of the people, improve the efficiency of the administrative services, ensure the fullest development of the less advanced regions and backward sections of the community and through sacrifices borne equally by all citizens, build up resources for national development. The vital role of this body is obvious. It promotes collective thinking and joint action by the Union and States and emphasizes the national character of the plans. Through its deliberations, uniformity is brought about in social and economic policies where national interests requires this, without in any manner impairing local initiative and responsibility.

The other committees should also be mentioned. The Central Committee for Community Development, which consists of the Prime Minister as chairman and members of the Planning Commission and the Ministers of Agriculture and Community Development as members, meets regularly to review the progress of the community development movement and guide the policies to be followed. The Committee for Land Reforms also consists of the Prime Minister as chairman and members of the Planning Commission and the Minister of Agriculture as members. It advises on proposals for land reforms received from States and reviews the progress made in legislation.

**Evolution of a National Plan :** *In democracies, plans can be effective only if there is the widest participation by interests concerned at all stages of their preparation and the largest measure of public support is obtained for their basic aims and the patterns of growth envisaged. This is particularly vital in regard to rural programmes: these can have no chance of success unless "the millions of farmers in the country accept their objectives, share in their making, regard them as their own and are prepared to make the sacrifices necessary for implementing them."* Considerable thought is devoted to these aspects and methods and procedures are revised from time to time in the light of experience. It might be useful to explain briefly the main steps taken with these ends in view.

The first stage is the formulation of the broad strategy and the basic objectives, including the aggregate and inter-sectoral financial allocations and the targets in terms of employment opportunities provided and increase in per capita national income. For working these out, the Commission holds frequent discussions with Central and State Ministries, the Reserve Bank of India, the panel of economists and other advisory bodies already referred to, including the Consultative Committees of Parliament. Questions connected with resources for the plan—from current revenues, public loans, small savings, etc.—and the limits of deficit financing are examined with the Finance Ministries of the Union and States and the Reserve Bank of India. Proposals on all these issues are placed before the Union Cabinet and discussed at several meetings. They are also considered by the National Development Council. The decisions reached form the basis for preparing the plans.

While these discussions are in progress, as the second stage in the preparation of plans, working groups are set up for different sectors of the economy—agriculture, education, health, industry, railways, etc. These consist of representatives of Ministries including technical officers and of the Planning Commission. In State subjects, working groups are set up in each State to work in close touch with the concerned Central group. These working groups indicate targets of production which can be achieved, with the technical and other resources available, irrespective of financial limitations—with specific projects, costs, etc. In the chapter on community development, it is explained how schemes for rural development and welfare are built up from the village upwards, for being incorporated in the State working groups' proposals. The programmes for industries in the public sector are initiated by the respective wings under the Ministries concerned. Those for the private sector are prepared by organized bodies representing individual industries. The Planning Commission considers these proposals, in consultation with the development councils for the industries for which these exist—these councils consist of representatives of the employees, labour and consumers and are set up under the Industries (Development Regulation)

Act, 1951—and with organized bodies of industries for which there are no such councils. Plans for industries in the public and private sectors are carefully co-ordinated. Plans for small scale and cottage industries are framed by State Governments and the autonomous bodies already referred to and are discussed with them before they are finalized. For example, an informal all-party Parliamentary Committee was set up in December, 1958, to consider issues relating to the Third Five-Year Plan and advise on them. It comprised leaders of political parties in Parliament, the Union Ministers of Home, Finance, Planning and Community Development, and the Deputy Chairman of the Planning Commission. Papers relating to the Plan were placed before the Committee from time to time and its views formed part of the material considered for the draft outline.

At the third stage, the financial and physical targets are brought together and a plan is prepared embodying priorities. For this, there are frequent discussions with the Ministries and with the Federation of Industries and other representative organizations. The plan, as settled, is placed before the Cabinet and the National Development Council, in the form of a 'Draft Outline'. When approved, the draft is published for public criticism. It is also placed before committees—five in number—of Members of Parliament of all parties, appointed by Parliament to consider it:

Committee 'A'—Policy, resources and allocations.

Committee 'B'—Industry, power and transport.

Committee 'C'—Agriculture and rural economy.

Committee 'D'—Social services.

Committee 'E'—Technical manpower and scientific research.

The observations made by the members are explained carefully.

At the fourth stage, detailed plans prepared by the Union Ministries and States are discussed. These plans show the expenditure on schemes and projects to be carried over from the previous plan and new ones. The financial resources to be provided by the States themselves and the quantum of Central assistance are also discussed. These discussions last several months. Efforts are made to ensure that the allocations to individual States are equitable and that special attention is given to backward regions and classes. The draft outline, revised in the light of these discussions and such further material as might be available, is again placed before the National Development Council for approval.

At the fifth stage, the preparation of the detailed report is taken in hand. Every chapter is sent in draft to the Ministries and edited. When completed, the report is placed before the Cabinet and the National Development Council. Finally, the report is placed before Parliament and resolutions are moved in both Houses by the Prime Minister. Discussions in both the Houses last for several days and many members take part

in them. Similarly, the plans for the States are discussed in local legislatures. The plans become effective after they are approved of in Parliament and the State legislatures.

Discussions take place in Parliament and State Assemblies at practically all the sessions on subjects connected with the plans—progress in implementation; working of important projects included in plans—irrigation, power, industrial and transport undertakings, price levels, etc. During the budget sessions in Parliament and State Assemblies, the working of the plan in the Union and the States is systematically reviewed as the annual plans form part of the budgets in the Union and the States. The reports of the Estimates Committees and Public Accounts Committees of the Parliament and State legislatures devote much attention to the working of the plans in individual sectors of the economy and these are discussed at considerable length. In these and other ways, interest in the plans is always maintained at a high level. The Planning Commission publishes periodical progress reports on the working of the plan. It published six such reports for the First Plan and five for the Second including a special appraisal report in May, 1958. These reports are invariably discussed in Parliament and in State legislatures.

Planning in India thus represents a great co-operative effort. Many agencies participate in the formulation of a plan at all stages. When the broad social aims and strategies of the plan and the allocations of financial resources among the sectors of the economy have been approved by the Cabinet and the National Development Council, detailed projects and programmes are prepared by technical and other officers of the Union Ministries and State Governments who are entrusted with the duty of implementing them. Similarly, the plans in the private sector are worked out with the co-operation of organized representatives of industries. Targets are fixed for industries as a whole. The distribution of the targets among the units is made on definite criteria and the units are free to carry out their expansion programmes in accordance with the laws and regulations applicable to all industries. In the distribution of resources available among detailed heads, projects and programmes, Union Ministries and State Governments naturally have much discretion; the Planning Commission co-ordinates their decisions in order to ensure that the Central and State programmes fit into one another. A national plan accepted by Parliament thus emerges with defined social and economic objectives and provides for a rate of growth which is thought necessary in the national interests. In the implementation of the plan, the Union and State Governments function in the respective spheres assigned to them in the Constitution.

**Priorities and Patterns of Development:** When the First Five-Year Plan was published, a long-term objective was placed before the nation. This was slightly revised in 1956 and accepted by Parliament. The objective is

the doubling by 1975-76 of the per capita national income as it stood in 1956 (approximately Rs. 280 in 1956 to about Rs. 550 before 1976 at 1952-53 prices). After the Census of 1961, forecasts of population growth showed net annual increases larger than in the estimates of 1956, as the result of an appreciable reduction in death rates.

|                | Population in (millions) |      |      |      |
|----------------|--------------------------|------|------|------|
|                | 1961                     | 1966 | 1971 | 1976 |
| 1956 estimates | 408                      | 434  | 465  | 500  |
| 1961 estimates | 438                      | 492  | 555  | 626  |

It has been decided that the nation should make the increased efforts needed to achieve the per capita rate of growth envisaged in 1956. This means a cumulative annual increase of 6 per cent in the years 1961 to 1976. The difficulties involved are understood; but there is absence of a sense of urgency in the nation—a conviction that, in modern conditions, even this rate of growth may not provide the minimum social and economic base required for the efficient working of democratic institutions.

In India's plans, the sectors of the economy are grouped under the following heads:

- (i) Agriculture and community development (including minor irrigation).
- (ii) Irrigation projects—multi-purpose, major and medium.
- (iii) Power—hydro-electric and thermal.
- (iv) Industries and minerals—heavy and producer goods industries, large-scale organized consumer goods industries, small-scale industries, and cottage industries.
- (v) Transport and communications—railways, ports, roads, etc.
- (vi) Social services—education, health, relief and rehabilitation, etc.

It might be useful to describe the patterns of growth evolved in the ten years covered by the First and Second Plans.

The basic aim of all planning is the improvement of the quality of life of men and women. In the plans, therefore, high priority is assigned to education—expansion of facilities at all levels to the maximum limit possible. Special importance was attached to the completion in the Third and Fourth Plans of the programme for free and compulsory education for boys and girls of the age group 6-14. Similarly, health plans—like those for eradication of malaria, provision of wholesome drinking water supplies, etc.—have high priority. From the outset, the Government of India accepted the need for family planning. In all the plans, there are financial allocations for assisting voluntary workers to carry on propa-

ganda and for government and other clinics to offer facilities to those who seek them.

High priority is assigned to increased agricultural production by scientific utilization of land and water resources and the spread of the community development movement. It is recognized that 'an agricultural revolution—marked rise in productivity per worker in agriculture—is a pre-condition of the industrial revolution.' Before planning commenced, multi-purpose projects and large and medium irrigation projects had been started in several States. These were included in the plan. Later, more such projects were added. Provision is also made for research in agriculture in the widest sense, animal husbandry and allied fields, and for teaching institutions. The community development movement, which provides a centrally-aided extension service for establishing contact with all families in the countryside, was steadily expanded to cover the entire country by 1963. In these sectors, the aim is to see that finance is made available for all useful schemes that can be carried out and to enlist for them the widest possible measure of public participation.

Power production is also given priority. At the end of the Second Plan, the total power generated was divided almost equally between hydro-electric and thermal power. The Third Plan target was 12.7 million kw. against 5.7 million kw. in 1960-61 and 3.4 in 1955-56.

Coming to industries and minerals, the Second Five-Year Plan sought to initiate the process of decisive transformation which Rostow calls the "take off", "when the economy, and the society of which it is a part, transform themselves in such ways that economic growth subsequently is more or less automatic". The industrial policy resolution of 1956 defined the roles of the public and private sector in industries. The resolution is worked in a flexible manner. The aim is that both sectors should work together, developing to the maximum extent possible. The First Five-Year Plan had included projects for additional production of iron and steel in the public and private sectors and for a plant for heavy electrical equipment. These were not started in the First Plan period and were carried over to the Second Plan. After a survey conducted in 1954, a target of six million tons of ingot (4½ millions of finished steel) was fixed for the Second Plan with coal, managanese and other targets to match. Among non-ferrous metals the production of aluminium for which raw materials are available had an important place. There were also allocations for a heavy machine building industry—a plant for heavy electrical machinery and plants for other machinery for which demand existed in the country. Provision was also made for heavy chemical and drug projects, after a survey of internal needs. India is advantageously placed for the production of iron, as it has high grade iron-ore, coking coal and other raw materials available in close proximity in certain regions, and manufacturing costs can be lower than in many other countries.

In the course of the Second Five-Year Plan, explorations showed the existence of petroleum reserves. The establishment of refineries and exploration in further areas were, therefore, accorded high priority. At the same time, the organized consumer goods industries had to be expanded to meet growing demands. These are almost entirely in the private sector. Investments in such industries increased steadily from plan to plan (Rs. 325 crores in First Plan, Rs. 850 crores in the Second and Rs. 1,056 crores in the Third). For planning and setting up heavy industries and those requiring modern technology, agreements for collaboration with foreign interests have been concluded; these provide foreign credit for purchase of equipment and machinery and expert technical assistance and training facilities for local staffs in India as well as outside. To give examples, the three steel plants in the public sector have such agreements with the U.S.S.R., West Germany and Britain; the heavy machine building project at Ranchi with the U.S.S.R., and the heavy electrical plant at Bhopal with British interests. There is foreign collaboration in oil exploration and for setting up of oil refineries. Technical collaboration agreements with foreign interests are encouraged for private sector projects as well.

From the point of view of employment, much importance is attached to small-scale and cottage industries. Special organizations have been evolved for assisting the growth of small-scale industries. (i) There are service institutes and extension centres in all States with technical personnel advising on projects, giving training, etc. (ii) Industrial estates have been set up in which developed sites or buildings are made available with power and other facilities. (iii) The National Small Industries Corporation supplies machinery on hire-purchase. (iv) The State Bank of India has a special scheme for giving credit to small industries. Autonomous Boards have been set up—the Khadi and Village Industries Commission; the All-India Handicrafts Board and the Handloom Board—which are doing good work in their respective spheres. The Handloom Board, for example, has brought about half the looms in the country into co-operatives (10,414 co-operatives with 1.3 million looms employing 1.6 million persons).

This industrial pattern was continued in the preparation of the Third and Fourth Plans with larger targets for iron and steel, petroleum exploration and refining, and heavy machinery manufacture including electrical, to meet the growing needs of the country as ascertained by surveys. Obviously, the definite programmes to be undertaken from time to time will have to be formulated on the basis of the foreign aid and technical co-operation available. Preliminary arrangements including training programmes have, however, to be organized with this broad objective in view. The provision under railways and ports is related to the volume of traffic to be handled and is increased steadily from year to year.

### III. The Five-Year Plans

**The First Plan:** The First Five-Year Plan had the following aims in view:

- (i) to restore the economy which had run down as a result of the war; to resist the inflationary pressures that were prevalent; to build up the transport system; and to ease the food and raw materials position;
- (ii) to formulate and execute programmes of development which would be substantial in themselves while laying the foundation for larger efforts in the coming years;
- (iii) to initiate measures of social justice on a wide scale, thus taking the first steps in the direction of the pattern of society placed before the nation by the Constitution in the Directive Principles;
- (iv) to build up administrative and other organizations which would be equal to the large programmes of reconstruction to which the nation is committed.

As there were inflationary pressures in the economy, the Planning Commission proceeded with caution in determining the size of the Plan. In the draft outline, the expenditure in the public sector was fixed at Rs. 1,793 crores which included deficit financing of the order of Rs. 290 crores. In the course of the Plan, the size was increased from time to time as inflation was being checked. Ultimately, the allocations under the heads in the public sector were as follows:

---

|                                                                                          | (Rs. crores) |
|------------------------------------------------------------------------------------------|--------------|

---

Over and above this, were the credits—short, medium and long-term—to agriculture given through the Reserve Bank of India, which were Rs. 60 crores in June, 1956. These were outside the Plan. Investments in organized industries in the private sector amounted to nearly Rs. 325 crores.

The table below shows the way in which the Plan in the public sector was expected to be financed and the way in which it was actually financed:

|                                                                             |  |  | (Rs. crores)               |         |

As a result of the First Five-Year Plan, there was an increase of 18 per cent in the national income or on the average of 3 per cent every year and direct employment was provided for 4.5 million persons. It is estimated that, in this period, population increased at the rate of 1.5 per cent a year.

**The Second Plan :** The size of the Second Plan was a subject to which much thought was given by the Planning Commission. It was first proposed that the public sector outlay might be of the order of Rs. 4,300 crores. It was soon found, however, that as the needs to be met were large and the technical and administrative organizations at the disposal of the Central and State Governments were capable of executing programmes of larger magnitude, the aggregate size could be increased to Rs. 4,800 crores. The increase was due largely to the requirements of the development of heavy industries, including iron and steel production, additional coal production and the improvement of the railway system. The net investment on the Second Plan was of the order of Rs. 6,100 crores—Rs. 3,800 crores in the public sector and Rs. 2,300 crores in the private sector. The 'current' expenditure amounted to another Rs. 1,000 crores. The aims of the Second Plan were formulated as follows:

- (i) an increase of 5 per cent every year in the national income;
- (ii) provision of employment to about 10 million persons;
- (iii) rapid industrialization with particular emphasis on the production of iron and steel and development of basic and heavy industries and on their co-ordination with a planned expansion of large-scale consumer goods and cottage and small-scale industries;
- (iv) reduction of inequalities in income and wealth and more even distribution of economic power, thus helping in the creation of a socialist pattern of society.

It was expected that an industrial plan of the nature envisaged would cause strains and stresses in the economy, especially on the side of foreign exchange. Actually the situation in the initial years was less favourable than anticipated owing to the set back in agricultural production caused by adverse seasonal conditions in the rice-growing eastern regions, a rise in prices in countries in which orders were placed for machinery, and the short-term effects of the Suez crisis.

It soon became clear that the financial resources required for completing the Plan would be significantly higher than the total of Rs. 4,800 crores envisaged initially. In May, 1958, therefore, the Planning Commission made a reappraisal of the Plan taking into account the progress made until then and the likely trends and requirements for the remaining years of the Plan. This survey also included a review of the foreign exchange resources already committed and likely to be available. The conclusion was reached that the expenditure in the public sector should be fixed at Rs. 4,500 crores. The private sector remained unaffected. Actually, the expenditure in the public sector came to Rs. 4,600 crores divided as follows:

---

|                                                                                  |    |    | (Rs. crores) |
|----------------------------------------------------------------------------------|----|----|--------------|

---

To this should be added credits—short, medium and long-term—given to agriculture through the Reserve Bank of India, which were Rs. 132 crores in June, 1959, as against Rs. 60 crores in June, 1956.

The total investment in the private sector was as follows:

|                                             | (Rs. crores) |
|---------------------------------------------|--------------|
| Agriculture and community development .. .. | 675          |
| Power .. .. .                               | 40           |
| Organized industry and minerals .. ..       | 725          |
| Village and small industries .. ..          | 225          |
| Transport and communications .. ..          | 135          |
| Social services and miscellaneous .. ..     | 1,000        |
| Inventories .. ..                           | 500          |
| <b>Total ..</b>                             | <b>3,300</b> |

The estimate of financial resources against the outlay of Rs. 4,800 crores and the actuals (Rs. 4,600 crores) was as follows:

|                                                                                                                       | (Rs. crores)               |                         |
|-----------------------------------------------------------------------------------------------------------------------|----------------------------|-------------------------|
|                                                                                                                       | As expected<br>in the Plan | According<br>to actuals |

\*Includes investment of P.L. 480 funds in special securities.

There is no doubt that in the ten years covered by the First and Second Five-Year Plans the economy gained considerably in strength. The industrial base was broadened and a large and growing class of skilled technicians and industrial managers came into existence. On the other hand, there were also some disquieting features. There was an upward trend in prices during the Second Plan period, though part of the rise was a corrective to an earlier decline. The index of wholesale prices (1952-53=100) rose from 98.1 in 1956 to 127.5 in 1961; food articles from 91.8 in 1956 to 117.6 in 1961 (cereals and pulses, however, were 100 and 93 in 1961); and industrial raw materials from 109.4 in 1956 to 159.1 in 1961. Also agricultural production lagged behind owing partly to administrative and technical short-comings, especially cotton (5.4 million bales as against 6.5), jute (4 million bales as against 5.5) and oilseeds (6.5 million tons as against 7.6). Further, exports were more or less stagnant; the annual average in the period of the Second Plan being Rs. 614 crores as against an annual average of Rs. 609 crores in the First Plan.

The deficit in the balance of payments over the First Plan period was Rs. 318 crores. This was financed by external assistance of Rs. 196 crores and the running down of foreign exchange reserves by Rs. 122 crores. For the Second Plan period, the balance of payments deficit was about Rs. 2,100 crores. This was met by external assistance, including P.L. 480, of Rs. 1,410 crores, using the foreign exchange reserves for Rs. 600 crores and drawings from the I.M.F., the net amount being Rs. 55 crores. The total foreign assistance authorized during the Second Plan period came to Rs. 2,450 crores, including P.L. 480 to the extent of Rs. 545 crores.

The national income and per capita income in the years covered by the Second Plan is shown below:

| Year<br>Financial | National income at<br>1948-49 prices<br>(Rs. 100 crores) | Per capita income in<br>Rs. (1948-49 prices)<br>based on 1941, 1951<br>and 1961 census figures |
|-------------------|----------------------------------------------------------|------------------------------------------------------------------------------------------------|
| 1950-51           | 88.5                                                     | 247.5                                                                                          |
| 1955-56           | 104.8                                                    | 267.8                                                                                          |
| 1956-57           | 110.0                                                    | 275.6                                                                                          |
| 1957-58           | 108.9                                                    | 267.4                                                                                          |
| 1959-60           | 118.6                                                    | 279.2                                                                                          |
| 1960-61           | 127.3                                                    | 293.2                                                                                          |

The rise in national income in real terms during the Second Plan period was 21.5 per cent as against 18.4 per cent in the First Plan period. The Planning Commission calculated that in the course of the Second Plan, employment opportunities created amounted to about 8 millions of which 6.5 millions were outside agriculture. The backlog of employment at the end of the Second Plan was estimated at 9 millions. The details of these "admittedly rough" estimates can be seen in chapter X of the Third Plan report. The report adds that "in addition, under-employment in the sense of those who have some work but are willing to take up additional work cannot be precisely estimated, but is believed to be of the order of 15-18 millions."

**The Third Plan :** The Third Five-Year Plan represented a crucial stage in the fulfilment of India's social and economic objectives. Taking into account the experience of the first two plans, the Third Plan was formulated with the following aims:

- (i) to secure a rise in national income of 5 to 6 per cent per annum, the pattern of investment being designed so as to sustain that rate of growth during subsequent plan periods;
- (ii) to achieve self-sufficiency in foodgrains and increased agricultural production to meet the needs of the growing population and also the requirements of industry and of exports;
- (iii) to expand basic industries like steel, fuel and power, and chemical industries and also establish machine building capacity, so that the requirements of further industrialization could be met within a period of 10 years or thereabouts largely from the country's own resources;
- (iv) to utilize to the fullest possible extent the manpower resources of the country and ensure a substantial expansion in employment opportunities; and
- (v) to establish progressively greater equality of opportunity and to bring about reduction in disparities in income and wealth and a more even distribution of economic power.

As already stated, revised forecasts of population on the basis of preliminary census figures showed figures of 438 millions in 1961 and 492 in 1966. The doubling of the per capita income before 1975-76 which is the objective of India's plans has, therefore, to be achieved under less favourable conditions.

The National Development Council fixed the aggregate financial outlay for the Third Plan at Rs. 7,500 crores for the public sector and Rs. 4,100 crores for the private sector distributed as follows:

|                                                               | Public Sector |                |              | Private Sector | Total         |
|---------------------------------------------------------------|---------------|----------------|--------------|----------------|---------------|
|                                                               | Plan outlay   | Current outlay | Investment   | invest-ment    | invest-ment   |
| Agriculture, minor irrigation and community development .. .. | 1,068         | 408            | 660          | 800            | 1,460         |
| Major and medium irrigation .. ..                             | 650           | —              | 650          | —              | 650           |
| Power .. ..                                                   | 1,012         | —              | 1,012        | 50             | 1,062         |

| Industry and minerals .. ..                                   | 1,520         | —              | 1,520        | 1,050          | 2,570         |
| Transport and communications .. ..                            | 1,486         | —              | 1,486        | 250            | 1,736         |
| Social services and miscellaneous .. ..                       | 1,300         | 678            | 622          | 1,075          | 1,697         |
| Inventories .. ..                                             | 200           | —              | 200          | 600            | 800           |
| <b>Total ..</b>                                               | <b>7,500</b>  | <b>1,200</b>   | <b>6,300</b> | <b>4,100</b>   | <b>10,400</b> |

To this should be added credits—short, medium and long-term—given to agriculture through the Reserve Bank of India. It was estimated that these would rise to about Rs. 390 crores by the end of the Third Plan. The level of investment, public and private, was expected to rise from about Rs. 1,600 crores in 1960-61 to Rs. 2,600 crores in 1965-66. In the public sector alone, the corresponding investment figures were Rs. 800 crores and Rs. 1,700 crores respectively.

The tentative estimate of financial resources against the estimates outlay of Rs. 7,500 crores in the public sector was as follows:

| Item                                                                                         | Rs. crores   |
|----------------------------------------------------------------------------------------------|--------------|
| Balance from current revenue (excluding additional taxation)                                 | 550          |
| Contributions of Railways .. ..                                                              | 100          |
| Surpluses of other public enterprises .. ..                                                  | 450          |
| Loans from the public (net) .. ..                                                            | 800          |
| Small savings (net) .. ..                                                                    | 600          |
| Provident funds (net) .. ..                                                                  | 265          |
| Steel equalization fund (net) .. ..                                                          | 105          |
| Balance of miscellaneous capital, receipts over non-plan disbursements .. ..                 | 170          |
| <b>Total of above items .. ..</b>                                                            | <b>3,040</b> |
| Additional taxation including measures to increase the surpluses of public enterprises .. .. | 1,710        |
| Budgetary receipts corresponding to external assistance .. ..                                | 2,200        |
| Deficit financing .. ..                                                                      | 550          |
| <b>Total ..</b>                                                                              | <b>7,500</b> |

The levels of investment in the private sector were later slightly revised as follows:

| Group                                    |    |    |    | Rs. crores |
|------------------------------------------|----|----|----|------------|
| Agriculture including irrigation         | .. | .. | .. | 850        |
| Power                                    | .. | .. | .. | 50         |
| Transport                                | .. | .. | .. | 250        |
| Village and small industries             | .. | .. | .. | 325        |
| Large and medium industries and minerals | .. | .. | .. | 1,100      |
| Housing and other construction           | .. | .. | .. | 1,125      |
| Inventories                              | .. | .. | .. | 600        |
| Total                                    |    |    |    | 4,300      |

The pattern of development in the Third Plan followed the pattern of the Second Plan with higher rates of investment and larger targets.

The cost of the programmes included in the public sector was estimated at Rs. 8,300 crores, as against the total outlay of Rs. 7,500. The greater part of the gap related to Central Government's schemes. Their total cost was Rs. 4,076 crores, the actual financial provision being Rs. 3,600 crores. In addition, supplementary items were mentioned in the Plan, notably programmes for creating additional employment opportunities, for which no financial provision was made.

The foreign aid needed for the Third Plan was estimated at Rs. 2,600 crores, exclusive of P.L. 480 imports. (Under P.L. 480 agreements entered into with the U.S.A. foodgrains valued at about Rs. 600 crores were to be imported during the plan period). This estimate was made on the basis that annual exports during the years covered by the Plan would amount, on an average, to Rs. 740 crores, i.e., aggregate exports of Rs. 3,700 crores for the five years of the plan. The need for concerted efforts for expanding was emphasized in the Third Five-Year Plan report, which also made specific proposals for the purpose, based on special studies undertaken in consultation with the Ministries and representatives of organized industries.

It was estimated that the plan programmes will provide employment opportunities for about 14 million persons during the Third Plan; the addition to the labour force could have been of the order of 17 millions—about a third of the increase being in urban areas. In the result, therefore, leaving aside the earlier backlog of unemployment, additional employment opportunities were required for 3 million persons. For this purpose, a special rural works programme for giving employment to 2.5 million persons, on an average of 100 days in the year, was prepared and financial allocations made for carrying it out. It was also expected that the impetus given to small-scale, cottage and other industries by

extending electricity to small towns would add to the employment potential of the plan.

It was expected that over the Third Plan period, the national income would increase by about 30 per cent. But because of two wars on India's borders in 1962 and 1965 and failure of monsoons, the Third Plan ended with the actual achievement being only half this target i.e. 15.5 per cent. The increase in population reduced the rate of increase in per capita income (in real terms) to 2.8 per cent for the entire plan period.

The difficulties encountered in the implementation of the Third Plan and the inadequate rate of growth in the economy, delayed the start of the Fourth Plan for three years until March, 1969. The interval was covered by three annual plans in which the level of investment was stabilized at the level of the last year of the Third Plan, to continue or complete the work on projects under construction and to consolidate the economy before expanding investment further. This limited objective of economic policy during the three year period was largely achieved by 1969. The recovery in agricultural production in 1967-68, marking the beginning of the "green revolution", and gradual revival of industry after a period of recession imparted considerable strength to the Indian economy and helped to achieve a fair degree of stability in the price level. which encouraged increased efforts to mobilize additional resources and step up outlays under the Fourth Plan.

#### IV. Other Functions of the Commission

**Institutional Changes: Social Change.** Reference has been made to institutional and other changes necessary for promoting large scale social and economic growth. It might be useful to mention the main changes briefly; these are dealt with in greater detail elsewhere.

The changes in the rural sector brought about by the land reforms laws and the panchayat and co-operative organizations are described in the chapters relating to these subjects. A new pattern of rural society is being evolved, with changes in attitudes and outlooks.

There have been reforms in the field of banking and life insurance to make them efficient instruments for planning. The Reserve Bank of India has been nationalized. Similarly, "The Imperial Bank of India" and its subsidiaries have been nationalized and reconstituted as "The State Bank of India" with units in States. With the nationalization of 14 major banks in July, 1969, nearly 83 per cent of the Indian banking has come under the public sector. Also, life insurance has been made a State monopoly under the Life Insurance Corporation of India. These new institutions have broad social objectives. The Reserve Bank of India, among other programmes, is supporting rural credit on an impressive

scale. The State Bank of India has a large programme for opening branches in order to spread the banking habit. During the five years 1955-60, it opened 400 new branches. It has also initiated schemes for financing small-scale industries. Similarly, the Life Insurance Corporation is spreading the habit of insurance in new areas and its investment policy is guided by the priorities in the plans.

To ensure that the private sector industries subserve the wider social purposes envisaged in the Constitution, the Industries (Regulation and Control) Act of 1951 was passed. Under it, development councils were set up to promote efficient working. There is provision in this law for management being taken over on specified grounds. A system of licensing of industries has been introduced to direct investment in accordance with plans. Mention should be made of the measures taken for improving conditions of labour; labour laws have been enacted including one for fixing minimum wages in agriculture; the setting up of bipartite machinery for adjusting differences; and laws providing for provident funds and retrenchment benefits. Lastly, there are special programmes included in all the plans for the welfare of backward classes and tribal areas and for colonization of agricultural labour. The social and economic changes initiated in these ways are gaining in momentum.

**Administration : Research and Evaluation.** From 1951 onwards, special studies have been made of questions relating to administration at all levels and the necessary reforms introduced. Mention may be made of the special reports submitted by A. D. Gorwala (1951), Paul Appleby (1953 and 1956), and V. T. Krishnamachari (August, 1962). The steps taken for improvement may be grouped under the following heads: (i) the expansion of the cadres of administrative and technical services and changes in training schemes and institution of refresher courses in India and abroad in order to meet the requirements of the plans; (ii) continuous 'audit' of efficiency through Organization and Methods divisions, vigilance units, etc; (iii) creation of new services required for planning and for industrial and other projects in the public sector like the Economic (Advisory) Service, the Statistical Service, the Industrial Management Service, etc; (iv) creation of new All-India Services in important fields of activity—Engineering, Forest, Medicine and Public Health—which, under the Constitution are State subjects. The district administration, which holds a key position, has been changed radically under the community development programme. Much thought is also devoted to such subjects as co-ordination of inter connected activities in the Ministries, relations between Cabinets and Civil Services, etc.

**Research** is entrusted to the Research Programmes Committee which was set up in 1953. It has 30 to 35 expert members drawn from the

fields of economics, sociology, political science and public administration. The committee meets twice a year. It has a Standing Committee and Regional Committees which meet off and on. The functions of the committee are to select subjects for research, invite schemes from universities and research institutes and scrutinize and approve them. The committee also guides research on the technical side—suggests standard concepts and definitions, illustrative schedules, etc. Upto the end of 1961, about 90 studies had been sanctioned on such subjects as social and economic effects of land reforms legislation in different regions; economics of farm management; social and economic problems of rapid urbanization; direct and indirect benefits of irrigation; resources for development—rural incomes and savings, mobilization of small savings, etc. Many of these studies have been completed and the reports published.

Two bodies have been set up for evaluation. The first is the Programme Evaluation Organization. This was set up in 1952 as part of the community development movement for making objective assessments of its impact on the economic and social life in rural areas. It has an economist at its head, with an advisory body of economists and sociologists. Though it is attached to the Planning Commission, the organization is autonomous. It is entitled to form and publish its own conclusion on the basis of studies conducted on the spot through its regional staff. The studies cover a wide range of subjects—the impact of specific programmes on rural life; acceptance of improved agricultural practices by farmers; progress of cottage industries; organizational aspects, etc. There are also studies of the working of panchayats and co-operatives at all levels. In all these studies, attempts are made to assess the extent to which the movement is achieving its main objectives—the development of self-reliance and community feeling among the people; their active participation in common programmes; and the measure in which its benefits reach the weaker sections of the community. The reports of the organization are considered at the annual conferences of Development Commissioners. The reports arouse wide interest and are discussed in Parliament and legislative assemblies and in the press.

The second is the Committee on Plan Projects which was set up in 1956. This committee consists of the Union Minister of Home Affairs as chairman and the Union Minister of Finance and Planning and the deputy chairman of the Planning Commission as members. When particular projects are taken up for investigation, the Union Minister concerned and two Chief Ministers of States are co-opted. The committee organizes investigations, including inspection of important projects or classes of projects through specially selected teams of experts recruited in the country and from outside, with the object of suggesting ways of securing maximum efficiency and economy in planning and execu-

tion. The teams make recommendations which are of general applicability. Investigations on these lines have been made in regard to: (i) buildings—multi storeyed office buildings, factory and residential buildings and for technical institutions and colleges; (ii) urban water supply schemes, etc; (iii) major irrigation projects; (iv) minor irrigation projects; (v) road transport schemes in States; (vi) groups of industrial undertakings in the public sector, etc. Other investigations are in progress. In all cases, reports of teams are considered by the Committee and steps are taken through the Union and State Ministries concerned to give effect to the recommendations.

### V. Appraisal and Prospects

The period of the Third Five-Year Plan has been a period of slow economic growth. The annual rate of increase in national income was only 3 per cent against the 5 per cent increase envisaged. This shortfall is due to a setback in agricultural production owing to bad seasons and to a slowing down in the rate of growth in important industries. Then, there was also the serious threat to national security and the continuing emergency the nation has to face. All development is inextricably linked up with national security, as the organization of defence in modern times needs a broad based agricultural and industrial foundation. The National Development Council which met in November, 1962, viewed the plan from this angle and readapted it so as to meet the urgent requirements. The 'annexure' shows the progress made in important sectors of the economy during the three plan periods. The conclusion that emerges is that a great national effort should be made to obtain, through highly increased administrative and technical efficiency, the best returns possible from investments that have been already made and that will be made from time to time on irrigation, power, industrial projects in the public and private sectors, transport systems, etc. The aim should be to secure the largest production possible as well as raise the maximum resources for investment in future development programmes. This means hard and sustained internal efforts in coming years. Much will also depend on the availability of foreign aid in suitable forms and the building up of export markets to the level of the targets envisaged in the plan. The realization of the objective of doubling by 1975-76 the per capita national income as it stood in 1955-56 has now become much more important than ever before. This means an annual cumulative rate of growth of a minimum of 7 per cent in the coming years. The nation has to meet this challenge unitedly and in a spirit of determination.

**ANNEXURE \***  
**Achievements under the Plans**

## CHAPTER II

# SURVEY OF NATURAL RESOURCES

Natural resources are natural materials or natural phenomena which man utilizes for economic activity. Agricultural land, forests, minerals, falling water, an estuary which contains a harbour and the climate and landscape of a resort town are among the natural resources of a country. The concept of natural resources is culture-bound: what does or does not constitute a natural resource, and the relative importance of different natural resources depend upon such cultural factors as the state of technology, the nature of demand, prices and socio-economic institutions. In India, while very small numbers of primitive shifting cultivators can obtain only a precarious living from vast areas of forest, large population of settled cultivators live next to them on small areas but at much higher levels of living. The advance from hunting and food gathering or primitive, shifting cultivation to settled agriculture is accompanied by an enormous increase in the efficiency of resource use and in the range of natural materials used. Similar changes take place with industrialization. Use of minerals or inanimate energy sources, which is very limited among agricultural peoples, is of central importance in the developed industrial countries. Per capita consumption of natural materials is much higher in these countries than in the under-developed countries which are predominantly agricultural or pastoral. The U.S.A. with only 6% of the world's population is estimated to account for more than half of the total annual world consumption of natural materials.

Efficiency of resource use is also much higher in the developed countries than in the under-developed countries: this is reflected in the higher productivity of agricultural land and of labour employed in natural resource exploitation activities in the former. An indication of the higher productivity of agricultural land is given by the data on yields of wheat and rice in selected developed and under-developed countries (Table 1). Crop yields have been increasing in the developed countries for a century or more as a result of improvements in techniques and management practices, especially use of improved, higher-yielding seeds, chemical fertilizers and pesticides. Yields per acre of wheat increased by 50% in Denmark between 1885-89 and 1949-51; similar increases took place in the other West European countries. A single technological advance, such as development of hybrid corn (maize), increased average yield of the crop in the U.S.A. by nearly 50% within a decade—from an average of 23.3 bushels per acre during 1931-35 to an average of 33.1 bushels during 1941-45. Further improvements in seed varieties, intensive use of chemical fertilizers, pesticides and other modern inputs

and improvements in farm management practices had raised yields progressively to 89.3 bushels per acre by 1969. Similar increases in crop yields with application of modern technology are now taking place in the under-developed countries. Yields of most crops have risen slowly in India during the last 15 years (Table 2). The yield of rice increased from 874 kg. per hectare in 1955-56 to an average of 1,054 kg. per hectare during 1967-69. The increase was greater in the case of wheat, from 708 kg. to 1,137 kg. in the same period, because the new, high-yielding varieties, introduced since 1966, have proved very successful in the wheat growing areas of northern India.

Differences in labour productivity in the natural resources sectors of the developed and the under-developed countries are much greater than differences in productivity of land; average productivity per agricultural worker, as measured by value of output, is nearly 34 times greater in the U.S.A. than in India.

**Technological Advance:** Besides raising productivity of land and labour used in the natural resource sectors, technological advance has been responsible, especially in recent years, for (i) development of synthetic substitutes for natural materials, ranging from metals to fibres, and (ii) an enormous increase in the spatial range of exploitation of natural resources. The most notable example of the latter is provided by extension of exploitation of oil and natural gas resources to the offshore areas. Offshore production of both has increased rapidly during the last decade and the recent discoveries in a number of regions, from the North Sea and the Mediterranean to various parts of the Western Pacific, especially the South China Sea, indicate that significant proportions of the world output of oil and natural gas will come in future from offshore sources. Exploitation has been confined so far to shallow, continental shelf areas; but the technology is advanced enough for development of resources located at greater depths. The sea floors may become important sources of other minerals also in the not so distant future.

Technological advance is often triggered off by shortages resulting from interruption of supplies, as during a war, or from progressive depletion of supply sources. Development of synthetic rubber, nitrogenous fertilizers and fibres like nylon have all resulted from war-time shortages of natural materials. Exploitation of offshore petroleum sources is a response to progressive depletion of on-shore oil-fields in major producing countries, such as the U.S.A., and the failure of new discoveries to keep pace with the rapid growth of demand—7 to 8% a year during the post-war period. On the other hand, there are innumerable examples of mineral deposits ceasing to be worked or crops or other natural products not being produced because of discovery of new, richer deposits, or availability of better or cheaper substitutes. The coal industries of

the U.S.A. and Western Europe have been depressed during most of the post-war period because of progressive increase in the proportion of energy derived from oil and natural gas in these countries. Cultivation of indigo stopped in India after the development of aniline dyes.

Abundance or scarcity of natural resources are relative terms which describe the demand-supply relationship. The latter depends in turn, on such factors as the size of the population and its level of living (demand) and the levels of technology and organization (supply). The expression, 'high pressure of population' on land, used so frequently for India, merely indicates that at the present levels of technology and organization, agriculture does not provide to the population of the country, food and other agricultural products, commensurate with its demands. A significant change in any one of the variables will change the relationship. Thus, the recent success of the high-yielding varieties of cereals (change in technology) has not merely relieved food shortage but has also changed the long-term outlook for increasing the food output to meet the increases in demand resulting from growth of population and rise in per capita consumption with increase in income. Accordingly, the natural resources of India have been viewed here in relation to the size of the population (547 million in 1971); its rate of growth (2.3% a year during the 1960's); the present levels of production and consumption of primary products, and projections of these to 1980-81, contained in the Fourth Five Year Plan.

**Natural Resources in the Indian Economy:** As in most other under-developed countries, most of the population of India is dependent upon agriculture and other primary activities which consist in direct exploitation of natural resources. Nearly three-fourths of the labour force is engaged in primary activities, with 70% in agriculture alone. Agriculture contributes about half of the gross national product; forestry and mining contribute about 1% each, and fishing accounts for about 0.5%. But in contrast to most other under-developed countries in which primary products are the major source of export revenues, India is a net importer of these products. In 1968-69, the value of agricultural and mineral imports was nearly 50% higher than that of exports (Table 3). Furthermore, according to current projections, the values of agricultural and mineral exports and imports will just balance by 1980-81, despite rapid expansion of the exports and stoppage, during the 1970's, of imports of foodgrains. As the following survey indicates, the natural resources of India are varied and provide an adequate basis for building a diversified modern economy. But they are not of such magnitude that exports of primary products could finance economic development in a significant way. The high pressure of population on land limits prospects of exports of agricultural products and deficiencies of petroleum and metallic

Accession number  
56017

and non-metallic minerals have necessitated sharply rising imports of these with industrial development.

**Knowledge of Natural Resources:** Knowledge of natural resources is much better in the case of India than in most under-developed countries. Basic resource survey agencies have been in existence for a century or more and systematic surveys and investigations of resources have been undertaken by them. The Trigonometric Survey of India was started in 1802, although the beginning of the Survey of India goes back further to the Survey of Bengal by James Rennel in 1767. During the 19th century, the Survey of India covered the entire country and several adjacent countries with topographic maps. The maps were periodically revised, but the work fell into arrears during World War I and the post-Independence period, because of other urgent demands on the resources of the Survey. Cadastral surveys formed an integral part of the system of land revenue administration which was established by the British. Large scale maps were prepared for all 'settled' villages in all the British provinces and in a number of princely states. In addition, detailed data on topography, climate, soils, drainage and the local social and economic conditions were collected during the periodic 'settlement and survey' operations that were undertaken in all areas of 'temporary settlement' (of land revenue) and were incorporated in the Settlement Reports and in the records maintained by the Land Revenue Department. These reports and records have few equals in the world for the wealth of local data that they contain. The field-by-field inspection, conducted by the village accountant (known as *patwari* in North India, *talati* in Maharashtra and by other local terms in other regions) during every crop season, still forms the basis of data on land utilization and crop production. Surveys of forests were undertaken similarly as part of the system of forest administration. Forest areas were mapped and detailed information on forest types, nature and density of vegetal cover, species of plants and wild life, which is of great scientific value, was collected. The Geological Survey of India, established in 1848, had prepared the first geological map of India as early as 1877. The map was revised in 1911 and again in 1933. Systematic geological mapping had been completed for one-fourth of the area of India by the time of Independence and smaller scale maps had been prepared for another one-eighth. Important mineral-bearing areas, such as coal-fields, had been surveyed in greater detail.

Besides surveys by the established survey agencies, valuable work on assessment of specific natural resources was done by various commissions and committees that were set up from time to time. The Irrigation Commission and the Electricity Commission made in the early years of this century detailed estimates of the irrigation and hydro-electric potentials respectively. Perhaps the principal deficiency in the pre-Independence

dence system of surveys was in respect of survey of soils. Systematic soil surveys were undertaken only for small areas, mainly areas of irrigation projects, in which they were needed for crop planning or correction of soil defects such as salinity or alkalinity. For the remaining agricultural areas, general qualitative descriptions of soils were contained in the Settlement Reports. They were useful for administrative purposes, but did not have systematic data on fertility characteristics or chemical composition of soils. Moreover, since a scientific scheme of classification of soils was not evolved, the descriptive data had limited value for a systematic survey of soils.

Work on mapping and surveys of natural resources has been expanded greatly under the five-year plans. The older survey agencies, such as the Survey of India and the Geological Survey, have been expanded in order to enable them to undertake larger programmes of work, and new agencies have been created to undertake specialized tasks or surveys in fields which had not been covered earlier. The Survey of India, which has had to undertake, in addition to its normal work of revision of topographic maps, topographic surveys in areas of various irrigation and other projects to provide base maps for them, has been greatly expanded and use of modern survey techniques, such as aerial photography, has increased greatly in its work. The Geological Survey has been similarly expanded in order to enable it to undertake detailed surveys and assessment of reserves of coal, iron ore and other minerals. The groundwater survey work of the GSI has also increased and is supplemented by groundwater investigations by the Exploratory Tubewell Organization of the Ministry of Agriculture as well as by the State Governments. The Indian Bureau of Mines was established in 1950 to undertake economic assessment of mineral resources and to formulate programmes of development. The Oil and Natural Gas Commission, established in the late 1950's to undertake exploration and development of petroleum resources, has been responsible for major discoveries of oil and natural gas in Assam and Gujarat. The Central Water and Power Commission, established in 1945, has responsibility for co-ordination of hydrological investigations and assessment of water resources. It has revised the estimates of irrigation and hydro-electric potentials, made earlier by the Irrigation Commission and the Electricity Commission respectively. A Soil and Land Use Survey has been established under the Indian Council of Agricultural Research and systematic soil surveys are being undertaken by it in co-operation with the State Departments of Agriculture. The country-wide fertilizer trials, undertaken since the early 1950s under the direction of the Indian Council of Agricultural Research, are yet another noteworthy aspect of work on soils. The national laboratories and institutes of scientific research also undertake studies relating to evaluation or utilization of natural resources. The work of the National Metallurgical Laboratory

on metals and of the Central Fuel Research Institute on coal deserve particular mention. The areas covered by the different natural resource surveys by the end of the Second Five Year Plan are shown in Table 4.

But experience under the Plans has demonstrated the need for further expansion or acceleration of work in some directions, greater use of modern survey and mapping techniques and more adequate economic assessment of natural resources. Investigations of soil fertility and of groundwater will need to be expanded and improved further in order to provide data for intensive use of chemical fertilizers and efficient water management which are essential for the successful use of the new high-yielding varieties of cereals or other programmes of intensive cultivation. Modern survey techniques, such as aerial photography, aero-magnetic survey and remote sensing, which have advanced very rapidly in recent years but which are not used adequately by the Indian survey agencies, will need to be used much more. The use of these techniques reduces the time requirements of surveys and preparation of maps: makes possible surveys of inaccessible areas and aids location or estimation of reserves of minerals and other natural resources. Precise estimation of coal and iron ore resources began to be undertaken when large programmes of expanding production of these minerals were initiated under the Second Plan. Similar surveys of other important minerals, such as bauxite, are an important part of the national resource inventory and should be undertaken. Another essential activity is illustrated by the work of the Energy Survey of India Committee (1965) which made an overall assessment of energy resources of the country and projections of demand upto 1986. The projections are being constantly revised on the basis of new discoveries or more precise estimation of the known energy resources and trends in demand.

### I. Land

**Topography and Climate:** Forty three per cent of the geographical area of India is plain, another 28 % is plateau and less than 30% is under hills and mountains (Table 5). It has been estimated that 62 % of the total area is topographically usable. The distribution of temperature and rainfall is also favourable for utilization of a large proportion of the area for agriculture or other productive purposes. Temperatures over the whole of India, except above certain altitudes in the Himalayas, are high enough to permit crop production throughout the year. The distribution of the geographical area by zones of annual rainfall (Table 5), indicates that more than two-thirds of the total area is in zones with rainfall of 750 mm. and above, and only 2% is in the zone with rainfall below 250 mm. But, in most parts of India, rainfall is concentrated in the brief monsoon period of 3-4 months—the period extends to nearly 6 months in Kerala and parts

of Eastern India — and the rest of the year is practically dry. This means that, except where irrigation facilities are available, or the dry season crop can be sustained by sub-soil moisture, supplemented by the small rainfall during the dry season, crop production has to be confined to the monsoon period. As a result, only a small proportion of the cultivated area, about 15%, grows more than one crop in the year. Moreover, since there is great variation in the monsoonal and the dry season flows of rivers, large storage reservoirs have to be built for irrigation, generation of hydro-electricity or other purposes, and most rivers are not suitable for navigation.

**Soils:** In the soil map of India, prepared by the Indian Agricultural Research Institute, 27 broad soil classes, besides glaciers, have been distinguished. The areas under the classes are given in Table 6. The agriculturally important soils are generally grouped into three major groups — alluvial, black and red and yellow. Their distribution is as follows:

| <i>Soil Group</i>                       | <i>Area<br/>(Million<br/>hectares)</i> | <i>Per cent<br/>of total<br/>area</i> |
|-----------------------------------------|----------------------------------------|---------------------------------------|
| Alluvial, including coastal and deltaic | 142.50                                 | 43.7                                  |
| Black, including mixed black and red    | 60.31                                  | 18.5                                  |
| Red and yellow, including laterites     | 61.93                                  | 19.0                                  |

The alluvial soils are found in the Northern Plain, the Plains of the East and the West Coast and in river valleys in the Peninsula. The largest area of black soils is in the western part of the Peninsula and is underlain by basaltic lavas, although the soils are found also, pure or mixed with red soils, in other parts of the Peninsula. Red and yellow soils are found mainly in the eastern and southern parts of the Peninsula which are underlain by ancient crystalline rocks. The structure, depth and texture of soils in different areas vary greatly with variations in the nature of the underlying rocks, topography, rainfall, drainage and other factors. In general, the black soils tend to be heavy, clayey and moisture-retentive—they have a tendency to fissure in the dry season; the alluvial soils are clayey or sandy loams while the red and yellow soils are light sandy loams. The alluvial soils and the black soils have higher natural fertility than most red and yellow soils. But all soils of India are low in nitrogen and organic matter and respond well to applications of nitrogeous fertilizers and organic manure.

**Land Utilization:** Data on land utilization in 1950-51, 1960-61 and 1966-67 given in Table 7, bring out the trends in utilization of land for agriculture and other purposes during the period of the first three Five Year Plans. The projections of the cropped area and the

irrigated area to 1980-81, (Tables 8 and 9), indicate the likely trends in agricultural land use during the present decade. Taken together, the tables provide a synoptic view of agricultural land use over a 30-year period.

**Agricultural Land:** This is defined here to include 'net area sown', 'current fallows' and 'land under miscellaneous tree crops and groves' (Lines 9, 8b and 6 in Table 7). The total area of agricultural land was 154.4 million hectares in 1966-67. Arable land, defined somewhat differently by the Food and Agriculture Organization (FAO) of the United Nations, totalled 163 million hectares in 1968, or just over 50% of the total geographical area (Table 10). The latter figure is the highest among the large or medium-sized countries of the world, indicating (i) the influence of favourable physical factors such as the large areas, extent of plains and plateaus and very small extent of arid areal (annual rainfall below 250 mm), and (ii) extension of cultivation to a large proportion of the cultivable land. But, because of the large population of the country, arable land per capita is not high; the figure of 0.3 hectares is lower than the average for the world and is only one-third of the U.S. figure. About 15% of the sown area is multi-cropped (sown more than once in the year), while a fifth of the gross cropped areas (20.9% in 1966-67) is irrigated. Irrigation makes possible extension of cultivation to dry lands which would not be cultivated otherwise. More important, it raises productivity of croplands through increases in the intensity of cropping and in crop yields. Most of the multi-cropped area is irrigated, and the security provided by irrigation facilities is a major factor in intensive application of labour and other inputs to obtain high yields. The influence of irrigation on crop yields is indicated by the following data on yields of rice and wheat taken from the National Sample Survey, 16th Round (1960-61):

| <i>Crop</i> | <i>Yield (Lbs. per acre)</i> |                    |
|-------------|------------------------------|--------------------|
|             | <i>Irrigated</i>             | <i>Unirrigated</i> |
| Rice        | 1,204                        | 761                |
| Wheat       | 985                          | 545                |

Figures are not available for later years, but the yield differentials between the irrigated and the unirrigated lands have probably increased after adoption of the high-yielding varieties, which are confined, almost, to the irrigated lands. The yield of wheat in Punjab-Haryana, where most of the crop is irrigated, was in 1961-62 81% higher than the yield in Madhya Pradesh where most of the crop is unirrigated; by 1970-71 it was more than three times as high :

| State          | Proportion of<br>cropped area<br>irrigated<br>(Per cent) | Yield<br>(Kg. per hectare) |         | Increase in<br>yield 1970-71<br>over 1961-62<br>(Per cent) |
|----------------|----------------------------------------------------------|----------------------------|---------|------------------------------------------------------------|
|                |                                                          | 1961-62                    | 1970-71 |                                                            |
| Punjab-Haryana | 71.1                                                     | 1,243                      | 2,173   | 75.0                                                       |
| Uttar Pradesh  | 59.1                                                     | 1,013                      | 1,286   | 27.0                                                       |
| Madhya Pradesh | 10.4                                                     | 685                        | 657+    | -4.0+                                                      |
| India          | 37.9                                                     | 890                        | 1,299   | 46.0                                                       |
|                | + 1968-69                                                |                            |         |                                                            |

Moreover, since increases in output through use of modern technology (high-yielding seeds, chemical fertilizers, pesticides etc.) will continue to be concentrated, in areas with assured, adequate and well regulated water supplies (mainly irrigated lands), the productivity differentials between the irrigated and unirrigated lands will continue to increase (see below).

**Non-Agricultural Land:** This includes land under forests, permanent pastures and other non-agricultural uses (towns, villages, roads, railways etc.); land classified as 'culturable waste' and 'fallow other than current', as well as barren and uncultivable land of mountain and desert areas. The total area of non-agricultural land was 172 million hectares in 1966-67. The classification of non-agricultural land has been improved considerably during the period of the plans: a more detailed scheme of classification was adopted in the early 1950s, and there is more careful recording of actual land use. Even so, the figures of different classes of non-agricultural land do not give an accurate idea of the nature of vegetal cover on them, or actual land use or the land use capability. In the areas classified as 'forests', the nature of vegetal cover varies all the way from dense forest through open woodland to poor scrub. On the other hand, some areas classified as 'culturable waste' are wooded. Grazing of livestock is not confined to the small areas, classified as 'permanent pasture'. It is permitted in most forest areas and most of the 'culturable waste', fallow lands (current and other than current) and vacant cultivated fields are also used for it. The large livestock population of India — 228.9 million bovine animals and 96.5 million sheep and goats in 1966 — are supported in this way. Finally, not all the areas classified as 'culturable waste', are suitable for cultivation. The Working Group on Land Use Policy of the Union Ministry of Agriculture had stated, after a reconnaissance survey of these lands in 1960, that "Ten million acres might be the upper limit of the additional areas that might become available for arable farming out of the existing culturable waste during the period of about fifteen years beyond 1960-61."

An adequate inventory of the land resource will involve:

- (i) further improvement in classification of land;
- (ii) specifying the nature of vegetal cover on all non-agricultural lands;

- (iii) indicating the land use capability of all lands, agricultural and non-agricultural, and the measures needed to effect changes from present to capability uses in lands in which such changes are required; and
- (iv) approximate estimates of the costs of the measures.

The inventory will require surveys of land use and land use capability over large areas and feasibility studies for reclamation and other land development projects in selected areas. The changes in land use will include both extension of cultivation to suitable waste and fallow lands and retirement from cultivation of agricultural lands of very low productivity, those suffering from severe erosion or located in erosion-prone areas, such as steep hill slopes. It may be mentioned that large areas of waste and fallow land remain uncultivated only because they suffer from defects, such as severe soil erosion, infestation with weeds, salinity or alkalinity. The total extent of such areas; the extent of the areas which can be reclaimed economically and the costs of reclamation should be indicated by the surveys and studies.

**Trends in Land Utilization:** The changes in land utilization between 1950-51 and 1966-67 (Table 7), represent the combined effects of extension of reporting to the areas which were non-reporting earlier; improvements in classification and actual changes in land use. The three effects can be separated only by examining district-level data, particularly for States like Rajasthan and Madhya Pradesh in which extension of reporting was the maximum. However, the data of Table 7 bring out (i) the progressive reduction in the areas classified as 'culturable waste' and 'fallow other than current' and increase in the 'net sown area'; (ii) significant increase in the 'area sown more than once'; and (iii) a large, 45 %, increase in the irrigated area. Reclamation of waste and fallow lands was relatively rapid during the 1950s, following land reforms, such as abolition of *Zamindari* and *Jagirdari*. The dispossessed *Zamindars* and *Jagirdars* reclaimed lands which had been left to them for 'personal cultivation', while their former tenants reclaimed waste and fallow lands to which they had acquired rights. The process was aided by loans and subsidies from the state governments. The increase in the irrigated areas was due primarily to the plan programmes of major, medium and minor irrigation. The programmes had created a total potential of about 18.5 million hectares by 1968-69, of which about 17 million hectares had been utilized.

Agricultural output increased at an average rate of 2.9 % a year during the period 1949-50 to 1968-69 (Table 8). About half of the increase was due to increase in the cropped area, while the remainder was the result of improvement in productivity. Increase in the cropped area was most

rapid during the early 1950s and slowed down later, while improvement in productivity had the opposite trend. The rate of growth of agricultural output, projected by the Planning Commission for the period 1968-69 to 1980-81 is much higher than the rate achieved in any earlier plan period; achievement of the projected high rate is considered essential for meeting the increases in demand for food and other agricultural products resulting from increases in population and per capita consumption. The rate of population increase, estimated at 2.5% a year for 1968-69, is expected to decline to 1.7% by 1980-81 with decline in the birth rate under the impact of the family planning programme. But the decline will be more than compensated by increase in per capita consumption; the rate of economic growth is expected to go up from 5.5% during the period of the Fourth Plan (1969-70 to 1973-74) to 6% in the remaining period.

Three-fourths of the projected increase in agricultural output is expected to come from improvement in productivity, the rate of which is expected to go up from 2.7% a year during the Third Plan period to 3.7% during 1969-70 to 1980-81. The projected rate of increase in the cropped area is also quite high, 1.2% a year, or twice the actual rate of the Third Plan period. But less than half of the projected increase will be through extension of cultivation (increase in the 'net area sown'); the balance is expected to be contributed by increase in the 'area sown more than once' (Table 7). The intensity of cropping is projected to increase from 114.3 in 1966-67 to 124.5 in 1980-81, but to be as high as 150 on the irrigated lands. Gross irrigated area is also expected to increase rapidly by 4.2% a year, to reach a total of 58 million hectares by 1980-81.

The projected increases in both productivity and the intensity of cropping are closely related to use of the new high-yielding varieties of cereals. Use of the varieties has been the major factor in the increase in food output experienced during recent years — from an average of 82.5 million tonnes during 1961-62 to 1964-65 to an average of 99 million tonnes during 1967-68 to 1970-71, and it is expected to contribute two-thirds of the projected increase in foodgrain output during the period of the Fourth Plan. Secondly, since the varieties have shorter growing seasons than the old varieties, multi-cropping is more feasible with them. But successful cultivation of the new varieties requires intensive use of chemical fertilizers, careful preparation of land and efficient water management. The last is best achieved in irrigated lands in which water supplies are adequate and assured, and can be effectively regulated to suit the requirements of individual crops. The emphases on extension of irrigation and on improvement in the quality of irrigation in the Fourth Plan, derive primarily from the water requirements of the new varieties. The principal programmes for improving the quality of irrigation are construction of wells and tube-wells and installation of electric pumps on

them. The programmes, initiated along with introduction of the new varieties in 1966, are being continued under the Fourth Plan and later through the 1970s. The emphasis on exploitation of ground-water is due partly to the large unexploited potential of the resource in some regions, but even more to the fact that water supplies from wells and tube-wells can be regulated much more effectively than supplies from canals or tanks. In Punjab-Haryana and Uttar Pradesh, where large areas are affected by salinity or water logging as a result of canal irrigation for several decades, the farmers have a preference for irrigation from wells and tube-wells. Moreover, as experience during the recent drought years 1965-66 and 1966-67 demonstrated, water supplies from ground-water sources hold up better during a drought than do those from surface sources, especially tanks.

**Soil Erosion and Other Defects:** Among the defects, such as soil erosion, infestation with weeds, salinity, alkalinity and water logging, which lead to deterioration or depletion of the land resource, soil erosion is the most serious, because it affects by far the largest areas. A detailed survey of soil erosion, estimating the total extent of erosion-affected areas and classifying the affected areas by type and severity of erosion, has yet to be made; but according to a preliminary estimate, about 200 million acres (80.8 million hectares) of land in the country require protection by soil conservation measures. The most serious damage is done by ravine erosion and erosion by *chos* (hill torrents). Ravine erosion is widespread in Madhya Pradesh, Uttar Pradesh, Rajasthan and Gujarat. It is estimated to have destroyed about 1.4 million hectares in Uttar Pradesh alone, while the total area affected by it and associated severe gully erosion may be as large as 10 million hectares in these four States. Erosion by *chos* occurs mainly in the sub-montane area of Punjab-Haryana, where about 1,813 sq. km. are affected by it.

Soil erosion affects both agricultural and non-agricultural land. Large areas of agricultural land, especially in Peninsular India, are affected by gully erosion; the areas whose fertility is depleted by sheet erosion are much larger. But the most severely eroded lands are non-agricultural, in which erosion follows denudation of vegetation as a result of over-grazing and indiscriminate cutting of trees and bushes. Village pastures, 'culturable waste' and 'fallows other than current' need particular mention in this context. Since grazing is free for all livestock belonging to the villagers, the numbers grazed are generally excessive. The consequent over-grazing and absence of any measures for improvement of pastures, lead to progressive denudation of vegetation, and in turn to soil erosion, which spreads frequently to the adjoining agricultural lands.

Programmes for control of erosion and conservation of soil and moisture have to be drawn up separately for agricultural and non-agricultural land and have to include in addition to agronomic and engineering measures, economic and socio-institutional measures. In agricultural land, the most needed measures are contour-bunding, contour-ploughing, terracing, planting of legumes and other soil-enriching crops, and changes in the cropping pattern, particularly reduction of fallow periods. They have to be accompanied by technical and financial assistance (loans and subsidies) to the cultivators. In some areas, tenancy reforms which give the cultivators security of tenure and provide them with adequate incentives to undertake the improvements may also be needed. Some agricultural land, located on steep slopes and other erosion-prone areas, may need to be taken out of cultivation and put under pastures or forests. In non-agricultural land, the most important measures are effective control over grazing and felling and gradual rehabilitation of the eroded areas through pasture improvement or plantation of trees. Engineering measures, such as terracing and construction of check dams are needed in severely eroded areas. The village panchayats have to be given technical and financial assistance for efficient management of the lands which are under their jurisdiction. But in critical areas, such as the watersheds of major irrigation or multi-purpose projects, if management by the panchayats does not result in adequate control over erosion, management by the Forest Departments should be undertaken.

Infestation with deep-rooted weeds such as *kans* is a serious problem in parts of Madhya Pradesh, Rajasthan and Bihar. An estimated 4 million hectares have been rendered uncultivable by it. A large programme of reclamation of these lands with heavy tractors was started in 1948 by the Government of India. But it had to be given up after some time because of the high cost of reclamation and various organizational difficulties. Reclamation by the tractor organizations of the State Governments and by individuals, however, continues.

Salinity or alkalinity of the soil and water logging are generally associated with irrigation from canals. They arise from seepage of water from canals and distributaries and faulty irrigation practices. The total area of saline and alkaline lands is estimated at 6 million hectares; most of it is located in Punjab-Haryana, Uttar Pradesh and Maharashtra. The area affected by water logging is estimated at 1 million hectares and is located mostly in Punjab-Haryana. The remedial measures include flooding of the land to remove excess salinity or alkalinity; providing efficient drainage, and lining of the canals and distributaries (generally drainage with brick masonry) to prevent seepage. The new canals of the Bhakra Nangal and Rajasthan Canal projects have been or are being lined.

Programmes of soil conservation and correction of other soil defects have been undertaken since the First Five Year Plan and have been progressively expanded. The expansion of the former is indicated by the following figures relating to expenditures and the areas benefited during the first three plans, and the targets of the Fourth Plan:

| <i>Soil conservation programmes</i>    | <i>Plans</i> |               |              |               |
|----------------------------------------|--------------|---------------|--------------|---------------|
|                                        | <i>First</i> | <i>Second</i> | <i>Third</i> | <i>Fourth</i> |
| Expenditure (million rupees)           | 16           | 180           | 780          | 1,594         |
| Area benefited +<br>(million hectares) | 0.3          | 0.8           | 4.0          | 6.9           |

+Figures for the First and the Second Plan relate only to areas benefited by contour-bunding.

Since the areas affected by soil erosion and the investment needs of erosion control and soil conservation programmes are very large, it has been necessary to select priority areas for the programmes. In the first three plans, priority was given to agricultural land, catchment areas of river valley projects and certain non-agricultural lands from which erosion spread to threaten large areas of agricultural land. The priorities remain unaltered under the Fourth Plan, but conservation measures in the catchment areas of the projects have been intensified, because sedimentation surveys have revealed that in a large number of projects, the actual rates of siltation are higher than the rates assumed at the time of construction.

## II. Water

Assessment of water resources is required for development of irrigation and navigation, generation of hydro electricity and meeting the domestic and industrial needs for water. These uses may be complementary or competitive. Irrigation and generation of hydro electricity are largely complementary, but irrigation and domestic and industrial use of water are largely competitive. Assessment of the water resources must include both surface flows and ground-water supplies and should indicate, in addition to the total quantities available, their location seasonal distribution and quality. In India as in many other countries, there is a hiatus between the geographical location of the areas and the seasons of the most urgent need for water and its availability in abundance, which limits possibilities of utilization of the available supplies of water and raises costs of utilization. A large proportion of the water supplies is located in zones with annual rainfall of 1,250 mm. and above, but the need, particularly for irrigation, is greatest in the zones of medium or low rainfall (below 1,250 mm.). The concentration of rainfall in the monsoon season further limits the scope for economic utilization of the

available water supplies. Defects in the quality of water also limit utilization in some areas; ground-water is brackish in large parts of Western Rajasthan. Pollution of river waters by discharge of urban and industrial wastes can affect their usability by communities or industries located downstream. The problem could become serious in the not distant future in case of river systems, such as the Ganga-Yamuna, on which a large number of cities are located.

The annual water balance of India has been estimated as follows:

|                                   | <i>Million Hectare metres</i> |    |      |
|-----------------------------------|-------------------------------|----|------|
| Total precipitation               | ..                            | .. | 373  |
| Evaporation                       | ..                            | .. | 124  |
| Surface flow                      | ..                            | .. | 168  |
| Seepage                           | ..                            | .. | 80.9 |
| Of which soil moisture            | ..                            | .. | 43.6 |
| Annual enrichment of ground-water | ..                            | .. | 37.3 |

One-third of the surface flow (56 m.h.m.) and 22 m.h.m. of ground-water are considered to be usable for irrigation. The ultimate potential of gross irrigated area had been estimated earlier at 70.85 million hectares; but the estimate has been recently revised to 82 million hectares. The increase is due to mainly to the larger possibility of multi-cropping, with use of the new high-yielding, short duration varieties of cereals. The progress of utilization of the potential under the plans and the projections to 1973-74 are as follows:

|                                                                | <i>Surface Water<br/>Quantity<br/>(Million<br/>hectares<br/>mtrs.)</i> | <i>Gross irri-<br/>gated area<br/>(Million<br/>hectares)</i> | <i>Ground-water<br/>Quantity<br/>(Million<br/>hectares<br/>mtrs.)</i> | <i>Gross irri-<br/>gated area<br/>(Million<br/>hectares)</i> |
|----------------------------------------------------------------|------------------------------------------------------------------------|--------------------------------------------------------------|-----------------------------------------------------------------------|--------------------------------------------------------------|
| Total Potential                                                | 56                                                                     | 60                                                           | 22                                                                    | 22                                                           |
| Utilization:                                                   |                                                                        |                                                              |                                                                       |                                                              |
| At beginning of First Plan<br>(1950-51)                        | 9.5                                                                    | 16.1                                                         | 6.5                                                                   | 6.6                                                          |
| 1968-69                                                        | 20.5                                                                   | 25.0                                                         | 10.9                                                                  | 10.9                                                         |

| Projected time period for full<br>utilization of the potential | —about 20 years—                                                       |                                                              | —about 15 years—                                                      |                                                              |

+ The projection of gross irrigated area for 1980-81, from both surface and ground-water sources, is 58.0 million hectares.

The estimate of the ultimate irrigation potential is based on detailed investigation of the potential of irrigation projects on the different river systems and of the ground-water supplies in different regions. The earlier total of 70.85 million hectares had been made up of 40.50 million hectares from major and medium projects and 30.55 million hectares

from minor irrigation works. The region-wise distribution of the potential of major and medium projects is shown in Table 11.

**Sources of Irrigation:** Somewhat over 40 per cent of the total irrigated area is served by canals; another one-third is served by wells and tube-wells and the balance gets water from tanks and other sources. The areas irrigated by canals and wells have increased more rapidly during the period of the plans, than that irrigated by tanks, while the area irrigated by other sources has declined:

| <i>Irrigation source</i> | 1950-51                            |                 | 1960-61                            |                 | 1966-67                            |                 |
|--------------------------|------------------------------------|-----------------|------------------------------------|-----------------|------------------------------------|-----------------|
|                          | <i>Area irrigated (m/hectares)</i> | <i>Per cent</i> | <i>Area irrigated (m/hectares)</i> | <i>Per cent</i> | <i>Area irrigated (m/hectares)</i> | <i>Per cent</i> |

| Tanks                    | 3.6                                | 17.3            | 4.6                                | 18.5            | 4.6                                | 16.6            |
| Others                   | 3.0                                | 14.2            | 2.4                                | 9.8             | 2.1                                | 7.5             |

The efficiency and dependability of irrigation from the different sources also vary considerably. In the areas irrigated by canals, supplies of water are generally more adequate and dependable to fields located at the head of an irrigation channel than to those located at the tail end. Supplies from tanks are less dependable than those from canals or wells during periods of drought, such as the two recent years 1965-66 and 1966-67. On the other hand, irrigation from wells can be regulated most efficiently to meet the requirements of crops because the irrigation source is entirely under the control of the individual farmer, and is also more dependable than those from tanks or canals.

**Water for Domestic and Industrial Uses:** Estimates of domestic and industrial consumption of water and projections of growth of consumption have not been made so far. This is a serious lacuna in assessment of the water resource which will affect efficient allocation of water among its competitive uses in particular regions. The requirements of water for domestic and industrial uses are not large, in comparison with those for irrigation, but they have increased rapidly in recent years, and will increase perhaps even more rapidly in future with acceleration of urban and industrial growth. The increases in supplies have not kept pace with increases in demand in the case of most large cities of the country, so that water shortage has become chronic. In Bombay, where water shortage has persisted since World War II, the demand was estimated at 350 million gallons a day in 1965, when the supply was only 210 mgd. In Calcutta, the water shortage had become so acute by the early 1960s, that 'emergency' water supply schemes had to be undertaken to relieve it.

One reason for the failure of supplies to increase along with increases in demand is the high cost of storage, transport and distribution works.

The cost of the expansion programme for Bombay to meet the projected growth of demand upto 1980-81 was estimated at 1671 million rupees. In case of Madras, the cost of increasing supplies from conventional sources was estimated to be so high, until investigations revealed suitable ground-water supplies near the city, that desalination of sea water was considered as a possible source of supply. The cost of desalination, although still high in comparison with water supplies from conventional sources, has fallen rapidly during the last two decades with advances in desalination techniques. It is still falling and desalination is beginning to be competitive with alternative sources of supply where the cost of the latter is high, or where desalination can be combined with generation of electricity and industrial development, such as manufacture of chemical fertilizers. Schemes for establishment of multiple desalination—power—fertilizers complexes, such as the one along the Saurashtra coast have been considered by the Government of India. A comprehensive survey of domestic and industrial water needs and formulation of a long-term programme for meeting them are urgently needed. The programme should include also measures to check pollution and maintain the quality of water at acceptable levels, especially in densely populated areas such as the Ganga-Yamuna basin.

### III. Sources of Energy

Per capita consumption of energy is an important indicator of economic development; it is much higher in the developed countries than in the underdeveloped countries. Figures for selected countries (Table 12) indicate that consumption in the U.S.A. was more than 50 times that in India in 1969, while that in Japan was nearly 15 times. The Indian figure is itself nearly four times the figure for Burma. Moreover, per capita consumption of energy has increased in India with economic development; the 1969 figure of 193 kg. of coal equivalent was 75 per cent higher than the figure of 110 kg. for the early 1950s.

Coal, oil and natural gas, hydro-electricity and nuclear fuels are the principal sources of energy in the developed countries. Commercial use of nuclear energy began only in the 1960s, but its growth has been so rapid that nuclear power stations, now under construction, represent substantial proportions of the new power generating capacity in the western developed countries. The three Indian nuclear power stations, located at Tarapur, Kotah and near Madras, will add more than 1 million kw. of generating capacity by the early 1970s. Coal is the most important source of commercial energy in India. In 1960-61, it contributed a little more than 20% of the total energy supply (Table 13). Oil

is a close second, but hydro-electricity, which contributed less than 3 per cent of the total energy supply in that year, is of minor importance. But all the commercial sources of energy contributed only 40 per cent of the total energy supply in 1960-61, and the remaining 60 per cent came from non-commercial fuels, such as cow-dung, fire-wood and vegetable wastes. Use of commercial fuels is confined to the modern sectors of the economy and to the urban areas; the energy needs of the rural population, 80 per cent of the total, are met almost entirely by non-commercial fuels. A study of rural fuel consumption, conducted by the National Council for Applied Economic Research, revealed that in 1960-61 only 5% of the energy needs of the rural population was met by commercial fuels. The preponderance of non-commercial fuels in rural energy supplies reflects the subsistence nature of the rural economy; the fuels are used because they do not have to be purchased. But it constitutes wasteful use of resources. Use of cow-dung for fuel is particularly wasteful because it deprives the soil of a most valuable organic manure. Some of the vegetable wastes could also be used in more productive ways. *Bagasse* could be a very useful supplementary raw material for manufacture of paper. The demand for paper is increasing rapidly and the principal raw materials, bamboo and *sabai* grass, are in short supply. Supplies of fire-wood are dependent upon large areas being kept under fire-wood plantations. While this may be the optimum land use for some areas, for most others it is not. But progress in changing rural consumption patterns is not likely to be rapid; non-commercial fuels are expected to continue to meet most of the energy needs of the rural population, and their consumption is expected to increase. The Energy Survey of India Committee had estimated a 43 per cent increase in energy generation from non-commercial fuels by 1980-81, although its contribution to total energy supplies was expected to decline from 60.4 per cent in 1960-61 to 27.8 per cent by 1980-81, due to more rapid growth of energy generation from commercial fuels (Table 13). The Committee made three projections of growth of demand for energy, based on different assumptions relating to growth rates of national income and industrial production. The projected values of the index of energy consumption in 1980-81 (1960=100) varied from a low 264.2 to a high 368.3. The intermediate projection, based on annual growth rates of 6 per cent in national income and 8½% in industrial production, has been used in Table 12 and in this section. The estimates of reserves of energy sources, given in the following paragraphs, are also based on the report of the committee.

**Coal:** The principal coal-fields of India are in the eastern and central States of Bihar, West Bengal and Madhya Pradesh. Outside of this area, there is only one important coal-field, the Singareni in the Godavari valley of Andhra Pradesh, although there are lignite deposits at Neiveli

in Tamil Nadu, in the Assam Hills and at Palana in Rajasthan. The concentration of coal-fields in one region and absence of water transport facilities from it to the consumption centres are handicaps for industrial and economic development; the cost of transport of coal by rail to most points in Southern and Western India is very high.

The total reserves of coal are large, but most of the coal is of poor quality. It is high in ash and has low calorific value. The reserves of coking coal, suitable for metallurgical uses, are small, being limited to the coal-fields of Bihar and West Bengal, principally the Jharia field of Bihar. But much of the coking coal also has a high ash content and has to be washed before being used for metallurgical purposes.

The Energy Survey of India Committee estimated that out of the total reserve of 5,800 million tonnes of coking coal down to 610 metres in the Jharia coal-field only about 1,800 million tonnes would become available for industrial use. Its calculation was as follows:

| <i>Seams IX/X to XVIII</i>                        | <i>Proved</i> | <i>Indicated</i>      | <i>Inferred</i>             | <i>Total</i> |
|---------------------------------------------------|---------------|-----------------------|-----------------------------|--------------|
|                                                   |               | <i>million tonnes</i> |                             |              |
| Down to 610 metres (2,000 ft.)                    | 2,510         | 2,504                 | 788                         | 5,800        |
| 510 to 1,220 mtrs.                                |               |                       |                             |              |
| (2,000 — 4,000 feet)                              | 11            | 406                   | 1,820                       | 2,237        |
| Total to 1,220 metres (4,000 ft.)                 | 2,521         | 2,910                 | 2,606                       | 8,037        |
| Mined coking coal 50% of 5,800 million tonnes     |               |                       | 2,900 million tonnes        |              |
| Washery yield 50% of 2,900 million tonnes         |               |                       | 1,450 million tonnes        |              |
| Addition of blendable 25% of 1,450 million tonnes |               |                       | 360 million tonnes          |              |
| <b>Total:</b>                                     |               |                       | <b>1,810 million tonnes</b> |              |

The quantity of usable coal could in fact be larger. Mining losses could be considerably less than 50%; the committee referred to a view of the Department of Mines and Metals of the Government of India according to which the losses could be reduced to 25%, raising the recovery ratio to 75% with stowing. Some production could also be expected from reserves below 610 metres, which have been entirely ignored by the committee. But these modifications do not alter materially the general picture of 30-40 years' supply of coking coal for an iron and steel industry of moderate size producing about 50 million tonnes of pig iron a year. The need for conserving coal has been recognized by the Government of India for a long time and a number of conservation measures have been taken. These include stowing, establishment of washeries, blending of weakly coking or non-coking coal with strongly coking coal, and substitution of coking coal by non-coking coal for non-metallurgical uses. The reserves of non-metallurgical coal, currently estimated at 115,000 million tonnes, are quite large. Recent advances in techniques of power generation from low quality coal and of transmission of power at high voltage over long distances favour construction of large, coal-

based power stations near the coal-fields and supply of power from them over large areas. These developments as well as advances in the technology of gassification of coal could reduce to a considerable extent the disadvantages of concentration of the coal-fields in one region of India.

**Petroleum:** The position regarding reserves of petroleum was summarized by the Energy Survey of India Committee as follows:

"India possesses an area of about one million sq. kilometres of sedimentary rocks which theoretically represent an oil potential; this constitutes nearly one-third of the country's total area. As the available geological knowledge regarding several of these sedimentary basins is meagre and of a very general nature, it is for the moment impossible to make any firm assessment of possible petroleum reserves. Of the areas so far explored for oil, much the most promising are those in Assam and Gujarat. The figures given for estimated reserves are constantly changing in the light of new knowledge. Recent guesses — and they can be little more — are that proved reserves in Assam may amount to 50 million tonnes and those in Gujarat to another 50 million tonnes. Both these areas are being intensively studied and it is too soon to be at all certain what the total reserves may be. There are approximately 100 million tonnes of proved reserves; including possible inferred reserves, the total may conceivably reach 175 million tonnes ... We are informed that the proved and inferred natural gas reserves, as estimated on the basis of present explorations, are 31.5 million cubic metres or only about 50 million tonnes of coal equivalent determined on a calorific equivalent basis."

There have been promising new discoveries in recent years, especially in the offshore area of the Gulf of Cambay. Estimates of petroleum reserves are liable to change continually with new discoveries, and further exploration in the Cambay area could lead to large oil finds, altering materially the above assessment. However, the Planning Commission has assumed only a modest increase in domestic production of petroleum — from 6 million tonnes in 1968-69 to 8.5 million tonnes in 1973-74 — and continued dependence upon imports for the greater part of the petroleum needs. Consumption of petroleum has been projected to increase from 16.1 million tonnes in 1968-69 to 26 million tonnes in 1973-74.

**Hydro-Electricity:** The estimates of the hydel power potential, made in the early years of this century by the Electricity Commission, have been revised in recent years, after further surveys and more precise estimation, by the Central Water and Power Commission. The ultimate potential is now estimated at 41 million kw. at 60 per cent load factor. Only 3.6 per cent of the potential had been developed by 1960-61. The total potential, the proportions of the potential developed and the demand for electricity in the different regions of India are given in Table 14.

Both Southern India and Northern India, which are far from the coal-fields, have large potentials, while Eastern India in which most of the coal-fields are located, has only a limited potential. Relatively high percentages of development of the potential in Southern and Western India, mostly in stations located along the slopes of the Western Ghats, reflect the comparative advantage of development of hydel power in these regions. On the other hand, as much as 30% of the total potential of the country is located in Assam, where the demand for electricity is very small, development is negligible at present and could remain limited. Other handicaps in development of the hydel potential are difficult communications; soft, unstable rocks in the Himalayan region and the susceptibility of the region to earthquakes; concentration of rainfall in the monsoon season, and fluctuations in rainfall from year to year. Because of these rainfall characteristics, storage works have to be large and thermal power stations have to be built alongside hydel stations, as standby power sources.

**Nuclear Fuels:** The nuclear fuels found in India are uranium and thorium. Deposits of uranium have been located in Bihar, Rajasthan and Tamil Nadu. The Bihar deposits have been investigated in some detail and 'indicated' and 'inferred' reserves in them are estimated to be in the neighbourhood of 10,000 tonnes. The reserves of thorium are much larger and it appears that, in the long run, development of nuclear energy will be with use of thorium. "There are some 500,000 tonnes of thorium, mainly in two deposits. About 200,000 tonnes are contained in the very rich (9% concentration) monazite sands of Kerala ... An even larger deposit in the Ranchi Plateau, partly in the Bihar region and partly in Bengal .. contains some 300,000 tonnes of thorium in monazite of a concentration of 10 per cent. The 500,000 tonnes of thorium has been described as equivalent to all the world's known uranium in ore containing 1% and above." But the use of thorium for generation of energy awaits the solution of a number of technical problems, especially development of suitable breeder type reactors. When suitable breeder type reactors are commercially available, India will be richly endowed with nuclear fuels.

**Non-conventional Energy Sources:** Coal, oil and natural gas are fossil fuels. Generation of energy from them only means using up past storages of energy. Much experimental work is in progress at present on utilization of currently produced energy — solar, wind, tidal, wave and geothermal. The problems relate mainly to reducing costs of obtaining energy from these sources to competitive levels. Work on solar energy is of particular interest to India because of the large number of sunny days during the year in most parts of the country. A technological

breakthrough in this area could change the energy outlook for India significantly.

#### IV. Minerals other than Fuels

This collective term may be used to include ferrous and non-ferrous metals and the non-metallic minerals. The latter is a very diverse group however, including minerals ranging from sulphur and common salt to building stones and clays. India has large resources of some of these minerals, but is deficient in others; an indication of the resources and deficiencies is given in Table 15, in which are included data on estimated reserves of about 20 selected minerals.

India's resources of iron ore are among the world's largest, are of high quality and are well distributed regionally. The largest deposits are in the eastern and central States of Bihar, Orissa and Madhya Pradesh but there are large deposits also in the South, in Tamil Nadu and Mysore, and in the West, in Goa and Maharashtra. India has large deposits also of high grade manganese ore and of limestone and dolomite and is thus well supplied with all the raw materials of the steel industry except coking coal.

But the situation is different in respect of non-ferrous metals, such as copper, lead, zinc and tin, and some non-metallic minerals, such as sulphur and rock phosphate. The known deposits of all of them are small and the demands are met mainly or entirely by imports. The principal deposits of copper are in Bihar, Rajasthan and Andhra Pradesh. Domestic production had until recently been only from the Ghatsila mine in Bihar but the Khetri deposit in Rajasthan has been developed and development of the Andhra Pradesh deposits is being considered. Production of lead and zinc is only from the Zawar mine in Rajasthan. There is no indigenous production of tin. The deficiency of copper is made up to some extent by the existence of large deposits of bauxite. Aluminium can be a substitute for copper in the electrical industry and has also a wide variety of other uses. It is a versatile metal, whose consumption has increased rapidly in recent decades. The bauxite deposits are of high grade and are well distributed regionally, being located in Bihar, Orissa, Madhya Pradesh, Maharashtra and several other States. The principal problem in their development is the high cost of power which is needed in very large quantities in conversion of alumina to metallic aluminium. The prospects of development appear most favourable in Bihar and Madhya Pradesh where large blocks of relatively cheap power could become available from thermal stations based on low grade coal.

Among the non-metallic minerals, there are large deposits of mica, principally in Bihar and Rajasthan, which are worked mainly for export.

The most notable deficiencies are those of sulphur and rock phosphate, raw materials of the chemical industry. There are no known deposits of elemental sulphur. There is a deposit of pyrites in Bihar, but production remains small because of the high cost of recovery of sulphur. Large deposits of high grade limestone and dolomite are found both in Eastern India in the vicinity of the coal-fields and the iron ore mines, and in other parts of the country. Building stones of great variety are found in different parts of Peninsular India. The white marble of Makrana in Rajasthan; the red and yellow sandstones of Rajasthan and Madhya Pradesh, and the granites of South India are the best known among them. Common salt is obtained by evaporation of sea water all along the coasts, and also from Sambhar Lake and salt wells in Rajasthan. The largest manufacture of sea salt is in Gujarat. The salt industry offers considerable scope for increasing recovery of by-products, such as potassium chloride.

### V. Forests

There is a large variety of forest types in India — from the tropical evergreens of Kerala and Assam to the conifers of the Western Himalayan region, and from the tropical deciduous of Madhya Pradesh and Orissa to the thorny scrub of Rajasthan. The variety of species is even greater. This variety of forest types and species is often found within short distances. Thus one can see within a small area of the Himalayan region the entire range from the luxuriant sub-tropical vegetation of the *terai* and the foothills to the conifers of the higher slopes. The variety of wild life matches the variety of vegetation; the two could be very valuable in development of recreation industries.

The total area under forests was reported to be 62,335,000 hectares or 623,350 sq. km. in 1966-67 according to the statistics on 'Classification of Area', collected by the Revenue Departments of the State Governments (Table 7). But according to the 'Forest Statistics', which are collected by the Forest Departments of the State Governments, the total area was 752,982 sq. km. (Table 16). The discrepancy between the two figures is due to differences in the methods of classification of 'forest' adopted by the two departments. The distribution of the forest area, as reported in the 'Forest Statistics', by type of forest, ownership, management and economic value, is given in Table 16. Coniferous forests, which occupy 6 per cent of the total forest area, are confined to the Western Himalayan region — in Uttar Pradesh, Himachal Pradesh and Jammu and Kashmir. Among the other forests, the most valuable are those of *sal* and teak, which cover together 189,000 sq. km. or about one-fourth of the total forest area. Most of the area of 'miscellaneous forests' is covered by poor scrub. More than 90 per cent of the

total forest area is under the ownership and management of the Forest Departments, the remainder being with the panchayats and individuals. But only the Reserved Forests of the Forest Departments are managed according to scientific management practices and have good stands of timber. These practices cannot be followed in the Protected Forests because the local people have virtually unrestricted rights of felling of trees and of grazing of livestock in them. Large areas of such 'Forests' suffer from severe soil erosion resulting from denudation of vegetation. The condition of most 'Unclassed Forests' is equally bad or worse. The classification of forest areas by economic value indicates that as much as one-fourth does not contain any merchantable timber.

Consumption of timber and other industrial wood was estimated at 11 million cu. metres in 1968-69 and was expected to increase by 1973-74 to 16-17 million cu. metres. In order to meet the increasing demand for industrial wood, a massive programme of clearing the existing forests and planting the cleared areas with quick-growing species, suitable for industrial use, was initiated in 1961. The programme represented a significant departure from the earlier forest management practices, which had been based on the principle of sustained yield through natural regeneration. The new approach emphasized quicker growth and higher yields with the aid of modern plantation practices. By 1968-69, 0.65 million hectares had been covered by the programme. In order to extend coverage by it, a pre-investment survey of 75,000 sq. km. of forest area is being undertaken during the Fourth Plan period.

Pulp for paper and other products is manufactured in most other countries from coniferous softwoods. The area of coniferous forests being small in India, the pulp is manufactured from other materials. Paper pulp is manufactured mainly from bamboo, but the rayon industry depends upon imported pulp. The forest development programmes, included in the Fourth Plan, aim to achieve self-sufficiency as early as possible, in major forest-based products such as pulp, paper, newsprint, wood panel products and matches. Furthermore, sizeable exports of paper and wood panel have been projected.

The increasing demand for fire-wood — a 25 per cent increase between 1960-61 and 1980-81 had been projected by the Energy Survey of India Committee (Table 12) — can also be met efficiently by plantations, located in waste-lands and other suitable areas, in the vicinity of towns and villages. The plantations can be managed directly by the Forest Departments, or by the village panchayats under the direction of the Forest Departments. The need for such plantations has been recognized for over a century — the first statement on Indian Forest Policy, made in 1870, included their establishment as one of its principal objectives — and plantation programmes have been undertaken. But they have not

been adequate, and a serious shortage of fire-wood is apprehended in rural areas. The Fourth Plan proposes an expansion of the programme and emphasizes the need for co-ordination of efforts among the various agencies concerned with it.

Afforestation in critical areas forms an essential part of erosion control and soil conservation programmes. The obvious first priority areas for the programmes are the catchments of major irrigation and river valley projects, in which afforestation is needed to prevent rapid silting of the reservoirs. Afforestation programmes have been undertaken in several catchment areas, from the Second Plan period and, as mentioned earlier, have been progressively expanded.

The recreation and tourism industries are just beginning to develop in India, but they have a large potential for growth. In order that forest areas may be utilized adequately for these industries, access to them has to be improved by construction of good roads and suitable facilities have to be provided for the stay of visitors. At the same time, adequate steps have to be taken for protection of wild life and natural vegetation. National Parks and Wild Life Sanctuaries have been established in most countries to achieve the twin objectives of recreation and protection. A number of National Parks and Game Sanctuaries have been established in India in recent years and facilities for travel to, and stay in, them are being progressively improved. The parks and sanctuaries are attracting considerable numbers of visitors, including foreign tourists, and can attract much larger numbers in future because they offer an opportunity to see animals, such as the tiger, elephant, bison and rhino, in their natural habitats, and also to observe flora of great variety and beauty. But there is still much surreptitious killing of wild life and destruction of natural vegetation in these areas. Species, such as the *cheetah*, and several species of deer have already become extinct and even the celebrated Indian tiger is seriously threatened. Measures for protection of wild life and natural vegetation will need to be made much more effective, *and soon*, if the rich wild life and natural vegetation of the Indian forests are not to be lost irretrievably.

## VI. Fisheries and Resources of the Sea

India has a coastline of nearly 5,635 km., but exploitation of fisheries and other resources of the sea has remained an activity of minor economic importance. Consumption of fish, marine or fresh-water, is small — less than 3 kg. per capita in a year. Fish is a significant item in the diet only of the people of coastal areas, or of States such as West Bengal in which fresh water fish is plentiful. Limited development of marine fisheries is due partly to unfavourable physical conditions — narrow continental shelf and a straight coastline with few good harbours on it. But cultural

and techno-economic factors have also hampered development. Fisheries along the coast of Gujarat were not exploited until recently because the local people are vegetarians. Secondly, since fishing has traditionally been done in small, non-power-driven boats, it had to be confined to a narrow zone of a few miles from the coast and had to be virtually suspended during the monsoon season and other stormy periods when the boats could not go out to sea.

The total catch of fish was estimated at 1.5 million tonnes for 1968-69. The Fourth Plan has indicated a target of production of 1.97 million tonnes, consisting of 1.4 million tonnes of marine fish and 0.57 million tonnes of inland fish for 1973-74. The bulk of the marine fish catch consists of mackerel and sardines, although in recent years there has been a rapid increase in the catch of prawns, mainly for export.

Fishery development programmes under the Five Year Plans have concentrated on the following:—

- (i) for the marine fisheries, mechanization of fishing boats and use of improved tools by the fishermen; use of trawlers for deep sea fishing, and provision of facilities for storage and transport of fish from the coastal areas to the major cities; and
- (ii) for the inland fisheries, stocking of reservoirs, streams and other water bodies with fingerlings.

The use of mechanized fishing boats has increased progressively; the Indo-Norwegian Fishery Development Project, which began in Kerala in 1952, has made a major contribution to the increase. By 1968-69, a total of 7,800 mechanized boats were in operation, and the number is proposed to be increased by 5,500 during the period of the Fourth Plan. The plan programmes include also addition of 300 trawlers, construction of additional facilities for storage and transport of fish and expansion of the fish stocking programmes in inland waters. A noteworthy development of recent years has been rapid increase in exports of fish and other marine products, especially prawns. The value of the exports increased from Rs. 46 million in 1960-61 to Rs. 340 million in 1969-70.

**Other Resources of the Sea:** Reference has been made above to exploitation of off-shore oil and natural gas resources, manufacture of common salt from sea-water and desalination of sea-water. These constitute, however, only the beginnings of exploitation of the resources of the sea. The sea floor is rich in minerals and technology is now sufficiently advanced to bring exploitation of these within the range of possibilities of the near future. Plant life of the sea also has immense potential for supplying food and raw materials. Marine algae are used for food in Japan and China and sea food can be processed for being added to cattle feed and for extraction of substances such as agar agar. The possibilities of economic exploitation of plant life of the sea are dependent, to a large degree, on technological advance.

**Conclusion:** This review has sought to relate the availability of natural resources of India to the present and projected near future (upto 1980-81) demands on them. The picture that has emerged is one of high pressure of population on land and forests; adequacy (or abundance) of some minerals and energy sources, but deficiency of others. A somewhat longer perspective, say upto the year 2000, will indicate rapidly increasing demands on natural resources to meet the needs of population growth and economic development. The population of India may be anywhere between 0.89 billion and 1.1 billion in that year; the lower projection of the Planning Commission, is based on expectation of a significant decline in fertility from the early 1970s, while the higher projections of the United Nations is based on the assumption of later decline in fertility. National income will be more than 7 times the 1968-69 figure, if the rates of growth of 5.5 to 6% up to 1980-81 and at least 6.5% thereafter, projected by the Planning Commission, are achieved. Estimating the magnitudes of demands on specific natural resources, or of specific primary products, is a complex undertaking, and the estimates have their limitations; the most recent estimates for the U.S.A., made in 1963, are already outdated because of rapid technological change. But absence of detailed estimates need not stand in the way of perception of the overall situation relating to the demands on natural resources, or of the measures needed to ensure that deficiencies of resources do not prove to be a serious impediment to economic development.

The growing demands for primary products will have to be met mainly from domestic production because, as experience during the drought years of the 1960s demonstrated, the need to import large quantities of primary products puts severe strains on the economy and the process of economic development is disrupted. But rapid enough expansion of domestic production will require, especially in agriculture, forestry and fishing, rapid modernization of production techniques; the slow rate of modernization of the period 1950-1965 will not be adequate. The high-yielding varieties programme in agriculture, the plantation programme in forestry, and mechanization of fishing constitute significant beginnings of the modernization process. In the mineral and energy sectors also, there is a very large potential for raising productivity and expansion of the usable resources through further modernization and technological advance. Productivity in coal mining can be greatly increased and the efficiency of utilization of coal can be greatly improved through these means. And, in the case of nuclear and solar energy, India has a vital interest in the development of new technology which would bring the large potential within the range of economic utilization.

Of course, modernization and technological advance are only one element of a comprehensive framework of policies on natural resources which must include, in addition, conservation, control over pollution

and preservation of the natural environment. These elements have begun to receive considerable attention in recent years in the developed countries in which serious problems of depletion of natural resources, pollution and deterioration of the environment have arisen. These problems exist in varying degrees in India also and these elements must be important constituents of the policies on natural resources; references have been made earlier in this chapter to the needs for conservation and control over pollution. But if any aspect of these policies has to be singled out as being the most important at the present stage of India's economic development, it is unquestionably rapid modernization of production techniques.

TABLE I

| Yields of Rice and Wheat—Developed and Under-developed Countries<br>(Kg. per hectare) |      |                         |      |
|---------------------------------------------------------------------------------------|------|-------------------------|------|
| A. Paddy Rice (Average 1966-68)                                                       |      | Wheat (Average 1966-68) |      |
| <i>Developed countries</i>                                                            |      |                         |      |
| Italy                                                                                 | 46.4 | United Kingdom          | 38.5 |

|                | Per cent of total land area classified as:                      |       |
|                | Plain                                                           | 43.05 |
|                | Plateau                                                         | 27.67 |
|                | Hill                                                            | 18.53 |
|                | Mountain                                                        | 10.74 |
|                | Topographically usable area*                                    | 62.08 |
| II.            | <b>Annual Rainfall</b>                                          |       |
|                | Per cent of gross sown area in zone of average annual rainfall: |       |
| <i>Assured</i> | Above 1,875 mm.                                                 | 11.1  |
|                | 1,250 mm. -- 1,875 mm.                                          | 22.3  |
| <i>Medium</i>  | 750 mm. — 1,250 mm.                                             | 33.8  |
| <i>Low</i>     | 375 mm. — 750 mm.                                               | 25.0  |
|                | 250 mm. — 375 mm.                                               | 5.6   |
|                | Below 250 mm.                                                   | 2.0   |

\*Topographically usable area has been calculated as follows:

|          |     |
|----------|-----|
| Plain    | 95% |
| Plateau  | 75% |
| Hill     | 25% |
| Mountain | 5%  |

TABLE VI

## India — Classification of Area by Broad Soil Classes

Approx. area in million hectares

|                                                                                                        |        |
|--------------------------------------------------------------------------------------------------------|--------|
| 1. Alluvial soil                                                                                       | 101.21 |
| 2. Alluvial soil, highly calcareous                                                                    | 8.91   |
| 3. Coastal alluvium                                                                                    | 8.50   |
| 4. Deltaic alluvium (occasionally saline)                                                              | 17.00  |
| 5. Alluvial soil, affected by salinity and alkalinity                                                  | 6.88   |
| 6. Desert soil                                                                                         | 14.57  |
| 7. Deep black soil                                                                                     | 6.88   |
| 8. Medium black soil                                                                                   | 18.62  |
| 9. Shallow black soil                                                                                  | 4.86   |
| 10. Black soil affected by salinity and alkalinity                                                     | 6.88   |
| 11. Black soil undifferentiated                                                                        | 12.55  |
| 12. Mixed red and black soil                                                                           | 10.52  |
| 13. Red soil                                                                                           | 30.36  |
| 14. Red gravelly soil                                                                                  | 1.62   |
| 15. Red and yellow soil                                                                                | 17.81  |
| 16. Laterite                                                                                           | 10.12  |
| 17. Laterite and lateritic soil                                                                        | 2.02   |
| 18. Brown soil under deciduous                                                                         | 1.62   |
| 19. Gray and brown soil                                                                                | 3.64   |
| 20. Hill soil                                                                                          | 2.43   |
| 21. Podsollic soil                                                                                     | 3.64   |
| 22. Forest soil laterised                                                                              | 6.48   |
| 23. Foot hill/Terai hill                                                                               | 5.67   |
| 24. Mountain Meadow soil                                                                               | 11.74  |
| 25. Mountainous soil undifferentiated                                                                  | 6.48   |
| 26. Skeletal soil                                                                                      | 2.43   |
| 27. Peat muck, very humose and humose soil, also called bog soils,<br>organic soils and half bog soils | 0.24   |
| 28. Glaciers and eternal snow                                                                          | 4.05   |
| Total :                                                                                                | 326.15 |

Note: Figures, given in acres in the original, have been converted into hectares.

TABLE VII

## India — Land Utilization and Irrigation 1950-51 to 1966-67

(000 Hectares)

|                                                                                   | 1950-51 | 1960-61 | 1966-67 |
|-----------------------------------------------------------------------------------|---------|---------|---------|
| 1. Geographical area                                                              | 326,809 | 326,809 | 326,809 |
| 2. Reporting area                                                                 | 284,315 | 298,458 | 305,610 |
| 3. Forest                                                                         | 40,482  | 54,032  | 62,335  |
| 4. Not available for cultivation                                                  | 47,517  | 50,751  | 48,293  |
| 4a. Land put to non-agricultural uses                                             | 9,358   | 14,840  | 15,534  |
| 4b. Barren and unculturable land                                                  | 38,159  | 35,911  | 32,759  |
| 5. Permanent pastures and grazing lands                                           | 6,675   | 13,966  | 14,085  |
| 6. Land under miscellaneous tree crops and groves (Not included in net area sown) | 19,828  | 4,459   | 4,110   |
| 7. Culturable waste                                                               | 22,943  | 19,212  | 17,101  |
| 8. Fallow land: 8a. Other than current                                            | 17,445  | 11,180  | 9,357   |
| 8b. Current                                                                       | 10,679  | 11,639  | 13,282  |
| Cultivation and Irrigation:                                                       |         |         |         |
| 9. Net area sown                                                                  | 118,746 | 133,199 | 137,047 |
| 10. Area sown more than once                                                      | 13,147  | 19,573  | 19,520  |
| 11. Gross cropped area                                                            | 131,893 | 152,772 | 156,567 |
| 12. Net irrigated area                                                            | 20,853  | 24,661  | 27,478  |
| 13. Gross irrigated area                                                          | 22,563  | 27,980  | 32,754  |

| Taiwan     | .. | .. | .. | 874    |

TABLE XIII

India—Energy Consumption in 1960-61 and Projection for 1980-81

(By primary sources, expressed in terms of million tonnes of coal replacement)

| Energy source                | Consumption in 1960-61 |          | Projection for 1980-81* |          |
|------------------------------|------------------------|----------|-------------------------|----------|
|                              | Quantity               | Per cent | Quantity                | Per cent |
| Coal                         | 49.9                   | 20.6     | 208.9                   | 27.8     |
| Oil                          | 39.1                   | 16.2     | 279.9                   | 37.2     |
| Hydro power                  | 6.8                    | 2.8      | 38.4                    | 5.2      |
| Nuclear                      | —                      | —        | 15.4                    | 2.0      |
| Total commercial sources     | 95.8                   | 39.6     | 543.1                   | 72.2     |
| Cow-dung                     | 21.6                   | 8.9      | 25.0                    | 3.3      |
| Fire-wood                    | 95.3                   | 39.4     | 125.0                   | 16.6     |
| Vegetable waste              | 29.2                   | 12.1     | 59.0                    | 7.8      |
| Total non-commercial sources | 146.1                  | 60.4     | 209.0                   | 27.8     |
| Grand total                  | 241.9                  | 100.0    | 752.1                   | 100.0    |

\*Intermediate projection, assumes annual growth rate of 6 per cent for national product and 8.5 per cent for industrial output.

TABLE XIV

**Regional Distribution of Potential and Development of Hydel Power, and Demand for Electricity**

| <i>Region</i> | <i>Potential*</i>   |                 | <i>Development</i>                                | <i>Demand for electricity</i>       |
|---------------|---------------------|-----------------|---------------------------------------------------|-------------------------------------|
|               | <i>Million twh.</i> | <i>Per cent</i> | <i>Per cent of potential developed by 1960-61</i> | <i>Per cent of All-India demand</i> |
| Eastern       | 14.2                | 6.5             | 5.6                                               | 26.4                                |
| Northern      | 36.6                | 16.9            | 2.8                                               | 9.6                                 |
| Central       | 43.9                | 20.3            | 1.1                                               | 15.5                                |
| Western       | 13.6                | 6.3             | 10.0                                              | 21.5                                |
| Southern      | 42.6                | 19.7            | 9.7                                               | 26.1                                |
| Assam         | 65.5                | 30.3            | 0.05                                              | 0.9                                 |
| All India     | 216.4               | 100.0           | 3.6                                               | 100.0                               |

\*The hydel power potential is estimated in aggregate at 41 million kw. at 60% load factor, which corresponds to 216.4 million twh. annual output on a firm basis.

TABLE XV

**India — Estimated Reserves of Selected Minerals**

| <i>Mineral</i>          | <i>Unit</i>    | <i>Quantity</i> | <i>Mineral</i>          | <i>Unit</i>    | <i>Quantity</i> |
|-------------------------|----------------|-----------------|-------------------------|----------------|-----------------|

## DEVELOPMENT OF WATER AND POWER RESOURCES

### A. WATER RESOURCES

#### I. Assessment of Resources

The Indian sub-continent ranging from the lofty Himalayas in the north, through the Indo-Ganga plains, the Rajputana (Rajasthan) desert, and the central plateau to the large peninsula in the south has varied topography and climate. The major part of the country has an average monsoon rainfall of over 100 cm. with the north-eastern and south-western regions receiving over 400 cm. in a normal year. This rainfall as well as the melting of the snows in the Himalayas give rise to a number of river systems which have been sustaining civilizations since pre-historic times. The Indus Valley civilization, the Aryan civilization on the banks of the holy Ganga, and numerous lesser known civilizations in the southern peninsula, all flourished on the water resources made available by the various rivers that flow in several directions in the country. The long coastline with the vast Indian Ocean also gave rise to many a civilization which established trade and cultural contacts with other countries extending from the Mediterranean Sea to the Pacific Ocean. Thus utilization of the natural water resources for the benefit of mankind in this part of the world is not new. But its systematic development, which keeps in view the present requirement, the future needs for the ever-increasing population as well as the equitable distribution of the natural wealth of the country can be said to have begun only with the dawn of independence in 1947.

**Rainfall Pattern:** Due to the movement of the sun to the northern hemisphere in the summer, seasonal winds, called the south-west monsoon, which are moisture-laden, originate from the huge Indian Ocean in the southern hemisphere, cross the equator and enter the Indian sub-continent from the south-west. Soon afterwards the monsoon bifurcates the Arabian Sea branch and the Bay of Bengal branch, the latter moving into parts of Assam in the month of May. Kerala, on the sea-side of the Western Ghats, receives the south-west monsoon between the last week of May and the first week of June. With the progress of the summer, the monsoon winds from the Bay of Bengal move northward and are stopped and deflected to the west by the Himalayas and this results in the whole country excluding the western parts of Rajasthan coming under the influence of the mon-

soon by the first week of July. However, the advance of the monsoon is not regular every year and is governed by the movement of depressions and low pressure waves travelling from the Bay of Bengal across the country. Moreover, precipitation in other areas is determined by the orographic features. While Assam, the western coastal plains and the Western Ghats receive heavy rainfall in all years, other parts of the country have to take chances on the number of depressions that occur in the Bay of Bengal during the monsoon months. Therefore, the annual monsoon rainfall variation in the central, northern and north-western parts of the country is much more pronounced than in the regions of abundant rainfall.

The monsoon starts withdrawing from the Punjab downward upto Saurashtra in Gujarat in the first week of September and disappears by the middle of November except in the extreme south and south-east where the receding monsoon gives rains as the north-east monsoon from the Bay of Bengal.

During the winter, the northern parts of the country get some rainfall from western disturbances but these are irregular and not reliable compared to the south-west monsoon. Severe cyclonic storms experienced during the transition months of April to June and October to December also cause heavy precipitation.

**Topography and River Systems:** The great rivers, Indus, Ganga and Brahmaputra together with their tributaries have their source in the glaciers of the Himalayas and are perennial as they are fed by the melting of snow in late winter and summer and are also rain-fed during the monsoon. The other river systems in the central and southern parts of the country are rain-fed and since the monsoon is limited to approximately 4 months *viz.* June to September, they have very low flows in the pre-monsoon months of March, April and May and even tend to dry up during this period.

The Himalayas may be regarded as a double mountain wall descending into a series of deep valleys towards the north from which the Indus, the Sutlej and the Brahmaputra rivers gather their waters while the southern slopes drain into the mighty Ganga system which forms one of the largest plains in the world extending over 1,500 km. The Indo-Ganga plain lies between the Himalayas in the north and the plateau of the peninsula in the south. This extends from India's boundary in the west to the Bay of Bengal in the east. The Brahmaputra and its tributaries drain the heavy rain-fed regions of Assam. In the Rajputana desert, which occupies a major part of the State of Rajasthan, rainfall is very scanty and till recently this area was thinly populated. The central plateau with the southern peninsula is almost triangular in shape and includes the whole of the country south of the Vindhya range, as far as

**Kanyakumari.** The plateau slopes up from the southern edge of the Ganga plains with the Vindhya hills ranging from about 500 metres to 1,700 metres in height and stretching from east to west for a length of about 1,300 km. Rivers from this central region flow in all directions contributing to the Ganga in the north, Narmada and Tapti in the west, Damodar and Mahanadi in the east and the tributaries of the Godavari in the south.

Leaving a narrow belt on the west coast, the Western Ghats with an average height of 1,000 metres run from north to south in almost a continuous stretch, dotted by a number of peaks reaching upto 2,400 metres in height. The Eastern Ghats on the eastern side of the plateau are neither as high nor as continuous as the Western Ghats. The average height of the Eastern Ghats is 450 metres and they recede inland as they stretch southwards and leave broad flat tracts of land between the hills and the sea. On the eastern coastal plains the deltas formed by the rivers Godavari, Krishna, Cauvery and other smaller rivers are fairly extensive in area and are fertile and suitable for intensive cultivation. The rivers draining the west coast are short in length, but swift due to the steep slope. The rivers on the east coast, however, are longer, but being in the rainshadow region their flow is meagre and inadequate to meet the needs of the region.

**Regions:** The average rainfall over the Indian sub-continent is about 110 cm. as a whole, and this rainfall over the country's land area of 328 million hectares gives a total precipitation of about 373 million hectare metres. Although this is an enormous quantity, much of it is lost in evaporation in this hot country and less than half of it appears as run-off. The mean daily evaporation in the country varies from about 2 mm. in the winter months in wet areas to as much as 16 mm. in the summer months in dry areas with the annual average for the whole country at about 6 mm. Therefore, the total run-off in the various river basins which includes the flood flows in the monsoon, dry weather flows from sub-soil storage and groundwater recharge is estimated at only about 167 million hectare metres.

For the purpose of assessment of the available water resources, the country has been divided into six regions as indicated below:

**1. Indus Basin:** This region in the north-west corner of India draining the western and northern slopes of the Himalayas has an area of 35.4 million ha. with average rainfall of 56 cm. The States of Jammu and Kashmir, Punjab, Haryana and Himachal Pradesh are located in this region.

**2. Ganga System:** This large basin of nearly 100 million ha. with

an average rainfall of 111 cm. extends from the southern slopes of the Himalayas in the north to the northern slopes of the Vindhya in the south and is spread over the States of Uttar Pradesh, Bihar and parts of Madhya Pradesh, Rajasthan and West Bengal.

**3. Brahmaputra System:** The mighty Brahmaputra system rising from the northern slopes of the Himalayas debouches into India at the north-east corner of Assam and is further fed by its various tributaries rising from the heavy rainfall regions of Assam, Nagaland, Meghalaya and the adjoining territory of Bhutan. The area of this region is 51 million hectares and it has an average rainfall of over 120 cm.

**4. Rajasthan (Rajputana) :** This forms part of the State of same name and is practically waterless. The total area is 17 million hectares with an average rainfall of 29 cm.

**5. West Coast:** The west coast draining into the Arabian Sea, excluding the Indus system, is also a region of high rainfall and parts of the States of Gujarat, Maharashtra, Mysore and Kerala form this region. The total area of this region is 49 million hectares and the average rainfall is 122 cm.

**6. East Coast:** Basins of rivers falling into the Bay of Bengal other than the Ganga and the Brahmaputra systems form this region which covers a wide area of over 120 million hectares and has a large population. Some areas in the interior are frequently affected by drought. Parts of Madhya Pradesh, Bihar, Maharashtra, Karnataka (Mysore) and the States of Orissa, Andhra Pradesh and Tamil Nadu form this region which has an average rainfall of 109 cm.

From the above description of the monsoon and the topography of the country it may be observed that India gets moderate rainfall which, however, covers almost the whole of the country. But the average rainfall is neither assured nor its distribution favourable for the crops every year. A few regions such as the west coast and Assam get consistently good rainfall; in other regions, although the average appears adequate, the variations in different years are considerable and, therefore, not suitable for dependable cultivation. The run-off records of the various river systems in India are incomplete and an assessment of the water resources from actual gauge-discharge records is therefore not possible for the whole country; but rainfall records are available for a long period and attempts have been made to forecast the run-off from the rainfall to assess the water resources for the whole country.

The Central Water and Power Commission had worked out the surface water resources of different regions during the period

1954-66. This study was based largely on a statistical analysis of the flow data wherever it was available and on suitable rainfall run-off relationships, wherever observed data was meagre. According to this study, in the year 1960 the water resources of the various basins amounted to 1,881,057 m. cu. m. (1,524 million acre feet) as detailed below.

TABLE I  
Surface Water Potential

| <i>River Basin</i>                                      | <i>Water Potential<br/>(Million Acre Ft.)</i> | <i>Remarks</i>                            |
|---------------------------------------------------------|-----------------------------------------------|-------------------------------------------|

| 17. Tons river basin                                    | 5.09                                          |                                           |
| 18. Gomti basin                                         | 5.86                                          |                                           |
| 19. Sone and other basins between Tons and Sone         | 40.65                                         |                                           |
| 20. Gogra                                               | 92.65                                         |                                           |
| 21. Right bank tributaries below Sone                   | 36.60                                         |                                           |
| 22. Left bank tributaries below Gogra                   | 141.60                                        |                                           |
| 23. Main Ganga                                          | 34.50                                         |                                           |
| Total:                                                  | 444.96                                        |                                           |
| <b>Zone No: V</b>                                       |                                               |                                           |
| 24. Brahmaputra and Barak basin                         | 478.90                                        |                                           |
| Grand total for Zones I, II, III, IV & V                | 1,524.23                                      |                                           |

**Groundwater Resources:** A scientific assessment of the groundwater potential of the country was not undertaken until a few years ago. Wells used to be constructed, and are even now being constructed, on the basis of local expertise and on the advice of water diviners. The construction of tube-wells in the Ganga alluvium of Uttar Pradesh was taken up in the thirties but this was based on local knowledge and not on any assessment of the groundwater potential. Groundwater mapping and groundwater exploration were, until recently, sporadic and limited to specific areas.

It was not until 1936 that a large-scale programme for the construction of tube-wells was undertaken in the Ganga alluvium of Uttar Pradesh when 1,500 tube-wells were constructed and channels laid to irrigate 3,367,000 hectares.

**Estimate of Available Resources:** Although groundwater has been located at a number of places, no systematic quantitative assessment has so far been made. Such an assessment can be made only on the basis of complete data on sub-surface geology, rainfall, evapotranspiration, run-off, percolation zone and extent of saturation, hydraulic gradient, aquiferous characteristics, geo-chemistry of water, etc. The collection, compilation and analysis of such data will naturally take time. The regime of groundwater in various regions has also to be systematically studied over a number of years.

The occurrence of groundwater, according to a recent assessment, is indicated in Table II.

**Utilizable Water Resources:** So far, no systematic study or analysis of the utilizable water resources of the country has been done except for the Indus river system. The Irrigation Commission (1969-72) has made some preliminary assessments and has indicated in its report that the entire water resources of the Godavari, Krishna, Narmada and Tapti rivers can be utilized. The waters of the Cauvery have already been practically fully utilized.

As regards the Ganga, which carries about 493,400 m.cu.m. (400 M.A.F.) of water on an average, the Commission assessed that it should be possible to utilize about 185,000 m.cu.m. (150 M.A.F.) for the development of irrigation. In view of the topography and the limited opportunities for storage, the rest of its waters will continue to flow into the Bay of Bengal, particularly during the monsoon season.

There is very little possibility of utilizing the Brahmaputra waters except through a few medium and lift irrigation schemes in Assam. Nearly 370,000 m. cu.m. (300 M.A.F.) of the Brahmaputra waters will continue to flow annually into the Bay of Bengal.

The west flowing rivers of India (excluding the Tapti and Narmada)

TABLE II  
Groundwater Resources (In Million Acre Feet)

are another important and significant source of water. These rivers carry on an average nearly 246,700 m.cu.m. (200 MAF) of water. However, on account of the very short distances traversed by them in their flow to the coast and the nature of the terrain, the possibilities of utilizing these waters for irrigation are very limited. It is, however, possible to divert eastward a limited quantity of water from these rivers for irrigation. Nearly 197,400 m.cu.m. (160 MAF) however will still continue to flow into the Arabian Sea.

The Mahanadi and other east flowing rivers have a sizable water potential though only partial utilization would be possible on account of the limited land potential and storage possibilities. About 74,000 m.cu.m. (60 MAF) of water from these rivers would still flow into the Bay of Bengal.

The utilizable water resources of the country, as assessed by the Irrigation Commission, can be broadly summed up as shown below:

## II. Development of Irrigation

India lies partly in the tropics and partly in the sub-tropical region. The general climate of the country is warm, and therefore, the temperature conditions would permit two or more crops over most of the country. However, since rainfall is concentrated over just 4 monsoon months, without irrigation cultivation is not possible for more than one crop. In regions where the annual rainfall is 100 cm. or less, agricultural production is mainly dependent on the favourable distribution of the monsoon rains. In a majority of the years, even if the average rainfall does not depart much from the normal, the distribution may be erratic and unreliable. In many years only a cash crop is possible. Even in regions with high rainfall, excess rainfall gives rise to floods and inundation of the sown areas, and this, coupled with long periods of break in the monsoons, results in a poor yield in a number of years.

Irrigation has been practised in India from pre-historic times and ancient Indian literature refers to wells, tanks, canals etc., which are

said to have been maintained efficiently with the State taking the responsibility of their maintenance and operation. The entire landscape in central and southern India is studded with numerous irrigation tanks, some of which have been constructed centuries before the Christian era. There are a number of small canals in the upper valleys of the rivers of northern India which are equally old.

Among the important ancient irrigation systems still in use is the old stone weir (Kallanai) which is reported to have been constructed by the ancient Tamil King Karikala Chola in A.D. 46 across the Cauvery, at the head of its delta. With the system of river channels and canals from the headworks, a large area of nearly 0.4 million hectares (1 million acres) is being irrigated for centuries. In the British period, the irrigation works constructed during the 19th century were the Western Yamuna Canal, Bari Doab Canal, Godavari delta system, Krishna delta system, Cauvery delta system, Agra Canal, Betwa Canal, Periyar canal system, Kharakvasla Storage Dam, Godavari Canal, Sarda Canal, Ganga Canal, Sone canal system, etc. Early in the 20th century, subsequent to the report of the First Irrigation Commission, some more projects such as the Krishna Raja Sagar, Mettur Reservoir, Nizam Sagar and a few others were taken up. These irrigation projects were in addition to the number of smaller irrigation works taken up all over the country to irrigate small areas. Thus, at the time of independence the total gross irrigated area that remained in India after partition was 22.6 million hectares. The details of important irrigation works in use at the time of independence are given in the following table:

TABLE IV

| <i>Sl. No.</i>           | <i>Name of Project</i>                          | <i>Year of completion</i> | <i>Gross area irrigated '000 ha.</i> | <i>Total cost of Project in Rs. million</i> |
|--------------------------|-------------------------------------------------|---------------------------|--------------------------------------|---------------------------------------------|

In the early forties, just before independence undivided India was one of the larger irrigated countries of the world. With partition nearly one third of the irrigated area of the country went to Pakistan. On account of the economic slump of the thirties, followed by the Second World War, further development of irrigation had also been slowed down, but the population had meanwhile increased fast. Since India was facing a severe food shortage soon after independence in 1947, greater attention was paid to irrigation to increase agricultural production in the Plans that were formulated since the fifties.

There was urgent necessity to increase agricultural production which could be best achieved only by extending irrigation facilities rapidly. Luckily, a large number of new projects had already been investigated as part of the post-war construction plans. Some of these were immediately taken in hand. Tungabhadra (1945), Hirakud (1948), DVC Project (1948), Malampuzha (1950), Chambal (1953), Lower Bhawani (1947), Manimuthar (1950), Bhadra (1947), Bhakra-Nangal (1945), Matatila (1950) and Mayurakshi (1946) are important irrigation and multi-purpose projects taken up during this early plan period. Most of these projects have by now been completed and full benefits achieved.

During the Plan period which commenced in 1950-51, regular procedures have been laid down for the implementation of the Plan targets. According to the practice thus established, no scheme can be taken up by the States until approval for the scheme is given by the Planning Commission, Government of India. The Central loan assistance given for these projects is also subject to this condition. The system in vogue classified all projects costing more than Rs. 50 million each as major. Irrigation schemes costing individually upto Rs. 1 million were originally classified as minor schemes. This limit was raised to Rs. 1.5 million in 1965 and to Rs. 2.5 million in 1970 (for schemes in hilly regions, this limit is Rs. 3 million). The other schemes costing between Rs. 2.5 million and Rs. 50 million are called medium schemes. For technical scrutiny of the major and medium schemes the Planning Commission is assisted by the Central Water and Power Commission in the Union Ministry of Irrigation and Power. The minor schemes are processed through the minor irrigation wing of the Union Ministry of Agriculture. In this manner, the criteria to be fulfilled for the inclusion of new projects in the Plan are ensured, and this procedure enables the Union Government to influence the pattern of development according to the national interest.

At the beginning of the First Five Year Plan, total irrigated area from all sources was 22.6 million hectares. The actual water utilization by these irrigated areas was about 9.5 million hectares of surface water. It has also been estimated that 22 million hectare metres of ground-

water can be exploited for irrigation purpose, to serve 22 million hectares, of which only 6.5 million hectares was developed at the beginning of the First Plan. The hydro-power potential of the country is estimated at 41.2 million kw. against which the installed capacity in 1951 stood at 0.56 million kw. Inland river water transport was restricted to certain parts of Assam, West Bengal and Bihar. Flood control was confined to a few embankments constructed on certain rivers.

The Planning Commission recognized that the foremost requirement in rebuilding the agricultural economy of the country was by large-scale development of irrigation and power. In this manner, the way for rapid industrialization of the country would also be paved. A target of doubling the area under irrigation in 20 years was set to be achieved by 1974. Rapid expansion of power generation was also aimed for increasing the low per capita generation of 21 kwh. in 1951; this has increased to 120 kwh. in 1972.

By the end of March 1969, India completed three Five Year Plans and three Annual Plans. During the three Five Year Plans and subsequent Annual Plans, 533 major and medium irrigation projects were taken up including 76 major projects. During the Fourth Five Plan since April 1969, 13 major and 33 medium schemes have been sanctioned so far. By the end of March 1972, 361 schemes (22 major and 339 medium) have been completed. The ultimate irrigation potential from major and medium projects has been estimated at 56.5 million ha. The irrigation potential of the major and medium irrigation projects so far undertaken has been estimated at 20.2 million ha. of which a potential of 10.7 million ha. was created by 1972-73 leaving a balance of 9.5 million hectares for development through the continuing schemes. This, together with 9.7 million hectares (23.9 million acres) of irrigation available from pre-Plan projects provides a total of 20.4 million hectares of irrigation potential from major and medium schemes.

Thirty-four important irrigation projects taken up since independence, each costing more than Rs. 200 million are listed in Table V. Of these projects, Nagarjunasagar, Tungabhadra H.L.C. Stage-I, Kosi Eastern Canal, Gandak, Ukai, Mahi Stage-I, Parambikulam Aliyar, Mula, Tungabhadra, Bhadra, Ghataprabha Stage-II, Hirakud, Mahanadi Delta, Ramganga, Mayurakshi and Kangsabati are programmed to be fully or substantially completed by the end of the Fourth Plan in 1973-74. Bhakra-Nangal and Damodar Valley Corporation projects have already been completed.

Minor irrigation schemes that were undertaken between 1951 and 1969, like tanks, wells, tube-wells, and lift irrigation and protection works provided new irrigation facilities to 6.12 million hectares of agricultural land at the end of 1968-69, and this added to the pre-plan minor irrigation of 12.88 million hectares (32 million acres) gave a total irrigation

| I Major and Medium Irrigation                                                  | 9.67     | 12.15   | 14.30    | 16.53                   | 18.08                          | 19.53    | 22.02               |
| II Minor Irrigation                                                            | 12.88    | 14.05   | 14.78    | 17.00                   | 19.00                          | 20.73    | 22.19               |
| Total                                                                          | 22.55    | 26.20   | 29.08    | 33.53                   | 37.08                          | 40.26    | 44.21               |

of 19.00 million hectares by March 1969. The total area under minor irrigation by March 1972, came to about 20.7 million hectares.

Thus, irrigation from all sources in India has increased from 22.55 million ha. in 1951 to 40.26 million in 1972, i.e., after 21 years of planned development of water resources for agricultural purposes. It is expected to reach 44.21 million hectares by March 1974. Table VI gives the progress in expenditure as well as benefits since 1951.

The spectacular progress in extending irrigation facilities has yielded remarkable results in additional agricultural production. The assured supply of water at the required period was the catalyst to farmers to use high yielding varieties of foodgrains and also fertilizers thereby increasing production.

**Hydro-Power:** The section on "Development of Power Resources" includes a detailed resume of the growth of hydro-power in India as well as future prospects. Here, the progress achieved after independence has been set out briefly. In the field of hydro-power generation the major projects commissioned during 21 years of planning are Bhakra-Nangal, Hirakud, Chambal, Rihand, Tungabhadra, Sharavathy, Kundah, Parambikulam Aliyar, Koyna, Sabarigiri, Machkund, Upper Sileru, Umiam and Bassi. These projects have increased the installed capacity or generation of hydel power by more than ten times since 1951. The installed capacity of hydro units in 1950-51 was 0.36 million kw. and this has increased to 6.61 million kw. in 1971-72. It is expected to go up to 7.5 million kw. by 1973-74. The Table below gives the plan-wise progress.

**TABLE VII**  
**Growth of Installed Capacity**

| <i>Year</i> | <i>Hydro Plants</i> | Million kw.  |
|-------------|---------------------|--------------|
|             |                     | <i>Total</i> |
| 1950—51     | 0.56                | 2.30         |
| 1955—56     | 0.94                | 3.42         |
| 1960—61     | 1.92                | 5.65         |
| 1965—66     | 4.09                | 10.17        |
| 1968—69     | 5.01                | 14.29        |
| 1971—72     | 6.61                | 17.00        |
| 1973—74     | 7.50                | 20.10        |

The important hydro power stations which have given benefits since the beginning of the Plan period are listed below.

TABLE VIII  
Hydro Power Stations and Installed Capacity

| Sl. No. | Name of Project            | Installed Capacity (MW) |
|---------|----------------------------|-------------------------|
| 1.      | Moyar                      | 3 x 12                  |
| 2.      | Sengulam                   | 4 x 12                  |
| 3.      | Machkund I                 | 3 x 17                  |
| 4.      | Ganguwal I                 | 2 x 24                  |
| 5.      | Ganga Sarda System in U.P. | 87                      |
| 6.      | Extension of Pykara        | 2 x 13.6                |
| 7.      | Extension of Jog           | 4 x 18                  |
| 8.      | Yamuna I                   | 84                      |
| 9.      | Machkund II                | 2 x 21                  |
| 10.     | Maithon                    | 3 x 20                  |
| 11.     | Panchet Hill               | 1 x 40                  |
| 12.     | Porlingalkuthu             | 4 x 8                   |
| 13.     | Periyar                    | 4 x 35                  |
| 14.     | Gandhisagar                | 5 x 23                  |
| 15.     | Tungabhadra                | 8 x 9                   |
| 16.     | Umiam                      | 6 x 9                   |
| 17.     | Penniar                    | 2 x 15                  |
| 18.     | Neriamangalam              | 3 x 15                  |
| 19.     | Hirakud I                  | 123                     |
| 20.     | Kundah I, II and III       | 425                     |
| 21.     | Mettur Tunnel              | 4 x 50                  |
| 22.     | Mettur Dam                 | 4 x 19                  |
| 23.     | Koyna Stage I              | 4 x 60                  |
| 24.     | Koyna Stage II             | 4 x 75                  |
| 25.     | Sharavathi I and II        | 8 x 89                  |
| 26.     | Bhadra                     | 33                      |
| 27.     | Hirakud II                 | 147                     |
| 28.     | Bhakra Left Bank           | 5 x 90                  |
| 29.     | Ganguwal II                | 1 x 29                  |
| 30.     | Kotla I and II             | 2 x 77                  |
| 31.     | Rihand                     | 6 x 50                  |
| 32.     | Bhakra Right Bank          | 5 x 120                 |
| 33.     | Matatilla                  | 3 x 10                  |
| 34.     | U.B.D.C.                   | 15                      |
| 35.     | Chinani                    | 14                      |
| 36.     | Obra Hydel                 | 3 x 33                  |
| 37.     | Sholayar                   | 54                      |
| 38.     | Sabarigiri                 | 6 x 50                  |
| 39.     | Kodayar                    | 100                     |
| 40.     | Kosi                       | 10                      |
| 41.     | Jaldhaka                   | 18                      |
| 42.     | Rana Pratap Sagar          | 4 x 43                  |
| 43.     | Bassi                      | 3 x 15                  |
| 44.     | Upper Sileru               | 2 x 60                  |
| 45.     | Parambikulam Aliyar        | 185                     |

This increase in generation capacity has made it possible to extend electricity to the villages also. The task of supplying power to nearly 600,000 villages spread out over the different corners of the country is indeed stupendous. Since independence, the boon of electricity has

been made available to over 130,000 villages holding a sure promise of prosperity to rural India. This also enables exploitation of water resources available near the farms by installing pump sets. By 1972, over 2 million pump sets were working with power.

**Future Programme:** Although India has made rapid strides in the development of its water and land potential for increasing agricultural production, the present levels of availability of food and standard of living in India are far below that of most nations of the world.

The achievements in the field of irrigation, though impressive indeed do not yet go far enough to meet the country's requirements. The total cropped area is at present about 163 million ha. but irrigation potential is available only to about one-fourth of this area. Food-grains production currently is around 110 million tonnes, which needs to be increased to about 160 million tonnes to provide at least a quarter tonne per head by 1981. To achieve this objective the area under irrigation will need to be increased at least by another 50 per cent. The increase will have to be in major and medium irrigation as well in minor irrigation, which calls for an increase of 1 million ha. in the area under irrigation every year on an average in each sector.

In the field of hydro power development the preliminary programme for the period 1971 to 1981 has been worked out so as to increase the installed capacity from 6.61 million kw. to 22.0 million kw. This will help increase the total installed capacity of power from 17 million kw. in 1971 to 52 million kw. in 1981.

### III. Flood Control

**Achievements:** While the problem of floods is as old as the rivers themselves, no extensive efforts were made scientifically to tackle it till the country achieved independence in 1947. The earlier efforts were mainly restricted to construction of embankments piecemeal, mainly erected by individual zamindars to protect their own lands from inundation. At the beginning of this century, when irrigation projects were taken up, some embankments were built to protect the irrigated lands from the ravages of floods. After independence, it was realized that these efforts were inadequate and therefore, multi-purpose reservoirs like the Hirakud and the Damodar Valley complexes were taken up for flood control and multi-purpose use of the stored waters. However, till 1954, no major countrywide programme of flood control was undertaken.

The year 1954 brought one of the worst devastating floods in the country which spurred the Government to concerted action. The Government of India, launched a National Programme of Flood Control

in that year. The main handicap, at its outset, was the lack of topographical and hydrological data to plan and implement the flood control schemes. The first priority was, therefore, given to collection of data, apart from undertaking immediate measures wherever necessary. This was subsequently followed by taking up properly planned schemes to control floods and to check river erosion. Floods have still continued to damage our economy, at an annual rate of Rs. 196 crores during 1953-1971. The maximum damage occurred during 1971 was estimated at Rs. 632 crores. Flood damage in 1972 was estimated at Rs. 149 crores.

**Policy and Future Programmes:** Under the Indian Constitution, flood control is a State subject. Investigation, planning, construction and maintenance of flood control, anti-erosion and drainage schemes are entirely the responsibilities of State Governments. In order to give this programme a national perspective, the Government of India announced in 1954, a national programme of flood control as mentioned earlier. To implement this programme effectively, various organizations at the State, Inter-state and Central levels have been set up. The Centre had also to take up another important role, that of helping the States to plan the schemes of Inter-state rivers to ensure that there are no adverse effects from schemes constructed in one State on another State. Upto the beginning of the Fourth Plan, specific allotments of funds were made for the flood control schemes in consultation with the States, depending on the nature and magnitude of the problem in each State and the priority of the schemes. From the beginning of the Fourth Plan, this system has been changed and the States are given various development programmes. The State Governments have, therefore, to earmark the financial outlays for various sectors of development, including flood control.

It is now proposed to accelerate the flood protection works to ensure that, at the end of the decade 1971-1981, at least 80 per cent of the areas in each State which are prone to floods are given protection. It is hoped that by the end of 1981, a total area of 10 million hectares may be provided flood protection in the country. This corresponds to about 66 per cent of the area that can be economically protected from floods. This programme besides benefitting new areas will also stabilize the benefits already achieved in some areas by raising and strengthening the existing embankments wherever necessary, and by enlarging capacities of drains to higher run-off factors. It is also proposed to take up construction of some storage works during this period. It is estimated that such a programme will require an outlay of Rs. 5,000 to Rs. 6,000 million. The various State Governments have been requested to investigate and prepare schemes and work out priorities for their implementation to achieve the targets.

In the national flood control programme, which was outlined in 1954, it was envisaged that the construction of embankments will essentially be a short-term measure. As a long-term measure, it was proposed to construct storage reservoirs on a number of major and minor rivers to control the floods passing lower down. Some storage projects had already been built with flood control in view, notable among which are the Hirakud dam on the Mahanadi in Orissa, and a series of 4 dams on the Damodar river system for the States of West Bengal and Bihar. In addition, a number of multi-purpose river projects have been constructed in the country which, although not providing specific flood storage, help considerably in moderating the flood flows. In the coming decade, more reservoir projects have been envisaged to provide permanent storage protection from the flood ravages. Such reservoirs, wherever feasible, are proposed to be planned for multi-purpose uses like irrigation and hydro-electric generation to make them economically viable.

In order to implement the national flood control programme outlined by the Government of India in 1954, a network of organizations has been set up at various levels.

At the State level, State Technical Advisory Committees and Flood Control Boards have been set up to examine the technical and economic feasibility of the schemes, to lay down policies for the formulation of these schemes, and to prepare long range plans for flood control. The planning and implementation of the schemes is being done by the irrigation departments in various States. There are no separate departments for flood control so far. However, recently in order to tackle the complex problems of flood control and erosion in a more scientific manner in the Brahmaputra Valley in Assam and in the north Bengal region of West Bengal, separate Flood Control Commissions have been set up. Two separate Boards of Consultants comprising experts in this field assist these Flood Control Commissions. To lay down policies and give direction to these Commissions, the Brahmaputra Flood Control Board and the North Bengal Flood Control Board have been set up with the Union Minister of Irrigation and Power as Chairman.

At the Inter-state level, four river commissions have been set up viz., the Ganga, the Brahmaputra, the North-west and the Central India Rivers Commissions. These are presided over by the Chairman, Central Water and Power Commission with the Chief Engineers of the States in the region as members, apart from the representatives of the Survey of India, Geological Survey of India, Ministries of Railways and Transport and the India Meteorological Department. These Commissions are entrusted with the work of coordinating the plans of various States in the river basins and solving Inter-state disputes.

In order to prepare and implement a comprehensive integrated plan

of flood control, erosion and drainage in the Ganga Basin as a whole, with the close co-operation of the Government of India, a separate flood control commission has been set up. The Government of India have also constituted the Ganga Flood Control Board headed by the Union Minister of Irrigation and Power and consisting of the Union Minister of State for Finance and the Chief Ministers representing the States of Bihar, Uttar Pradesh, West Bengal, Haryana, Rajasthan and Madhya Pradesh as members.

At the Central level, there is the Central Flood Control Board. This is presided over by the Union Minister of Irrigation and Power and has the Union Ministers of Railways, Transport and Agriculture as well as the representatives of the State Flood Control Boards as members. This Board lays down broad policies for the programme, reviews the progress achieved in the various activities of flood control and gives an overall direction for the implementation of the programme.

In order to assist the Central Flood Control Board, the Union Ministry of Irrigation and Power and the Planning Commission, a separate flood control wing has been created in the Central Water and Power Commission. This organization carries out the technical scrutiny of various flood control, drainage, anti-waterlogging and anti-sea erosion schemes and also assists the State Governments in planning and implementing of the flood control programme. It also provides expert assistance on specific problems referred to it. Since 1969, this organization has also undertaken the work of flood forecasting on major rivers in six States, viz., Assam, Bihar, Uttar Pradesh, Orissa, West Bengal and Gujarat, in addition to the forecasting on the river Yamuna in Delhi which has been taken up from 1959. This has helped State authorities to take timely action, both for the safety of the engineering works as well as the arranging of timely evacuation and relief measures.

Flood warning and flood fighting are the responsibilities of the State Governments. In these fields, varying practices are being adopted by different States. In order to make them uniform and effective, the Central Water and Power Commission has recently circulated a manual of flood operation, indicating the frame work of organization for flood warning, flood fighting, etc.

During the last 18 years, about 40 per cent of the area which can be economically protected has been afforded protection, with an investment of Rs. 2,552 million. The average annual outlay works out to only 11 per cent of the average annual damage caused by floods. In order to set up the programmes and to achieve the objective of minimizing the damage, a decade plan has been proposed to provide protection by 1981 to at least 50 per cent of the area liable to floods.

While the various known methods of flood control have already been adopted the major emphasis so far has been on the construction of embankments. This is now proposed to be supplemented with the construction of storage reservoirs, wherever feasible. In order to tackle the programme on a concerted basis, separate organizations exclusively devoted to flood control have been set up, as mentioned earlier, in the States of Assam and West Bengal as well as for the Ganga Basin as a whole covering six States. It is proposed to extend the flood forecasting systems in the country to reduce the loss of life and property by giving timely warnings. Setting up of organizations to effectively carry out flood warning and flood fighting is also proposed.

While the progress achieved so far is significant in the context of the overall magnitude of the problem as well as its ramifications, it is equally necessary to accelerate the programme and set up new organizations so that the recurring damage is minimised as early as possible. This is particularly important since, with the increase in the pressure of the population and the rapid progress of industrialization in the country, flood control would be vitally necessary to prevent set-backs to socio-economic growth.

#### IV. Future Perspective

About one-third of the area of our country is subjected to drought. The current percentage of irrigation attained in the drought districts is low as compared to the average of the country as a whole. Moreover, most of the irrigation is through minor schemes, which usually are unable to provide adequate quantities of water and very often fail during critical periods. Even after taking into consideration the increase in the irrigated area by utilizing the balance of the available local waters, the percentage in most cases is still on the low side. In order to improve this proportion to a reasonable level, it will be necessary to consider schemes for importing water from outside the basin. There is an imbalance in the distribution of available water resources in the various regions of the country in relation to the areas of water demand and in relation to the time and need during the year. The northern and eastern rivers fed by high rainfall during the monsoon carry abundant discharges. The snows of the Himalayas help in keeping these rivers perennial although the discharge during the dry season is a small fraction of that in the rainy months. The western and southern rivers on the other hand, being purely rain-fed, have very uncertain flows because of the vagaries of the rainfall and the annual yield of these rivers is also highly variable. These conditions of high discharges available for only the short rainy period point to the obvious need for conserving the flows in the high flow period for utilization in the lean months. Many large storage tanks have

already been constructed and several more are in various stages of construction and planning. Even after harnessing the utilizable water resources, many rivers like the Ganga, Brahmaputra, Mahanadi, etc. will carry large volumes of water to go waste into the seas. A country with so many drought prone regions can ill-afford to waste all these surplus waters and it is essential that these are put to use for meeting the needs of the deficient areas.

In order to achieve these objectives, it has been proposed to inter-link the various major rivers, thus enabling transfer of surplus flows to areas of deficit supply. This will remedy, to some extent, the imbalance of the regional water resources. The geographic relation between regions of water supply and water demand will be such that the overall picture will comprise two main groups of water transfer links; one extending from the east to the west and the other extending from the north to the south-west and the south. Subsidiary links, branches and connectors with intra-basin and local projects and other services will also be necessary. When identified, these features will constitute a National Water Grid, investigations for which are proposed to be taken in hand shortly. The major part of this grid would be the ambitious programme of linking the Ganga in the north to the Cauvery in the south probably by the turn of this century.

## **B. POWER RESOURCES**

### **I. Historical Background**

**Power Policy:** Under the Constitution of the India, electricity is a concurrent subject, with responsibility both of the Centre and the States. It is a field in which private entrepreneurship accounted for most of the earliest developments, whereas today State undertakings predominate. Electricity development in the country started at about the turn of the 20th century. From timely, impressive beginnings, and after an unduly prolonged period of halting growth, progress has been accelerated during the last twenty years of planned development. The total installed generating capacity in the country in March 1970 stood at 15.5 million kw. to which State-owned public utilities contributed 12.5 million kw. (80%), private utilities operating under licences 1.6 million kw. (10%), the rest of about 1.4 million kw. (10%) being in the non-utility sector, i.e., State-owned as well as licensed private industries, which generate electric power for their own consumption. Prior to independence, out of a total installed capacity of 1.7 million kw. in the entire country, State-owned utilities contributed only 0.37 million kw. (21.8%), which is indicative of the subsequent change in the role of the Government in this field.

**Early Legislation:** From the earliest stages, the power to legislate

in the field of electricity development was vested in the Central Government. Legislation to control electricity supply actually preceded the setting up of the electrical utility industry. The first legislative measure was introduced as the Electricity Act of the Government of India in 1887, at a time when electrical installations covered only a few dynamos feeding arc lights and electric candles. The primary object of this bill was to enable the Governor-General in Council to frame rules for protecting the public, person and property from injury from appliances or apparatus utilized in the supply of electricity for lighting and preventing telegraph lines from being injuriously affected by these appliances. The question of control of electricity supply undertakings by means of licences was considered but action was deferred. The Act was regarded as a preliminary measure to be reviewed as soon as some experience in the field had been gained.

In 1891, when proposals were received from the Indian Electricity Supply Syndicate for the establishment of works for supply of electric lighting to the city of Calcutta, the Government of Bengal represented to the Centre that further legislation was called for, either (a) by a general Act applicable to the whole of India or, (b) by a local and special Act for Calcutta, to enable it to issue licences for electric supply, and to exercise control on other related matters such as protection of the interests of the electric supply undertakings and of consumers from excessive charges. The second alternative was recommended by the Central Government and this led to the enactment of a local Act in Bengal, viz., the Calcutta Electric Lighting Act of 1895, applicable to Calcutta and providing for its extension to other municipalities in Bengal. The question of amending the Act of 1887 to provide for control of electric undertakings by means of licences, was again considered by the Government of India in 1895 but it was felt that the more important Provincial Governments, with Legislative Councils of their own, could pass Acts similar to the Calcutta Act whenever required and, in the other minor administrations, no urgency was felt.

In 1900, the Government of Bengal, faced with the need for a modification and extension of the Bengal Act of 1895, suggested that it would be desirable for the Central Government to frame a comprehensive Act applicable to the entire country. It was also represented from other parts of India that promoters of electric enterprises would welcome such legislation. The Provincial Governments were also generally in favour of a general Act. In this context, the Electric Supply Act of 1903, which repealed the Act of 1887 and the Calcutta Electric Lighting Act of 1895, was passed. This Act specifically provided for control by licence, of undertakings supplying electricity to the public, for purposes of traction etc. and also for making rules and reference of disputes for arbitration. It

was, however, recognized that even this Act was a tentative measure requiring amending legislation at an early date.

In the early years of power development, the electricity supply industry was organized predominantly by private enterprise for serving the needs of populations in large towns and cities. Soon many difficulties were encountered in the working of the 1903 Act. While the power to issue licences under this Act rested with the Provincial Government, yet authority or previous sanction of the Governor-General in Council in regard to certain matters was required. This resulted in dual administration and almost every application for a licence had to be referred to the Governor-General in Council resulting in inordinate delays. These being detrimental to promotion of electricity development, a committee of amendment to review the various provisions of the 1903 Act was appointed in 1907, and its deliberations led to the repeal of the 1903 Act, and passing of the Indian Electricity Act of 1910.

**The Electricity Act 1910:** General administration of this Act, and the granting of licences, subject to the control of the Governor-General in Council, were left in the hands of the Provincial Governments, only the rule making powers being reserved to the Governor-General in Council. The Act provided for the issue of licences for establishment of electric utility undertakings, laid down the responsibilities and duties of the licencees, ensured that adequate safety measures were taken by the utilities and consumers in the distribution and use of electricity, and incorporated generally all the regulations and controls necessary for the smooth running of the industry. It was primarily regulatory in character and concerned itself a great deal with essential provisions of safety. The main purpose of the Act was not so much to promote the development of the power supply industry as to exercise adequate control in the public interest. In 1922, the control of the Governor-General in Council in granting of licences was also abolished in accordance with the spirit of the Montague-Chelmsford Reforms. The Government of India Act of 1935 assigned the subject of electricity, to the concurrent list, and this resulted in the responsibility of the Central Legislature being confined only to introducing legislation in the field, while the complete administration of the legislative measures vested with the Provincial Governments. The 1910 Act has been modified from time to time in the light of subsequent experience and to suit the changed political situation in the country after independence.

**Beginning of Electricity Supply Industry:** Electricity was first introduced in the country in the year 1897, when a 130 kw. hydro-electric project, utilizing the unregulated waters of a Himalayan hill stream, was launched by the Darjeeling Municipality in Bengal under a licence.

The first steam-driven power plant, rated 1,000 kw., was installed at Calcutta two years later in 1899 by the Calcutta Electric Supply Corporation. The first major hydro-electric installation was the 4,500 kw. Sivasamudram Station on the Cauvery river, launched in 1902 by the Mysore Durbar to supply power to the Kolar Gold Mines. The capacity of the Station was progressively increased from 4,500 kw. in 1902 to 15,700 kw. in 1920. Sivasamudram was not only the first major power scheme in India designed to promote industrial development but had the distinction of having, associated with it, one of the longest -- 145 kms. at 70 kilovolts -- transmission lines in the world at that time. In 1909, the Kashmir Durbar inaugurated its Jhelum Power Station (installed capacity 4,000 kw.) at Mohora. Several thermal installations sprang up in 1906, notably in Madras, Kanpur and Delhi.

The most impressive scheme of power development in the period after the enactment of the Act of 1910, and prior to the First World War, was the 50,000 kw. hydro-electric scheme implemented by the Tatas at Khopoli in 1914 under which waters of an east flowing tributary of the Krishna river, were harnessed ingeniously by impounding and westward trans-basin diversion of these waters across the continental divide, to utilize a fall of 500 meters, available in the neighbouring basin. The capacity of the thermal stations in the various cities was increased, and small installations mushroomed at the more important towns. Electricity tariffs were high and development of electric supply on the whole was not progressive.

**Impact of World War I:** The outbreak of World War I brought matters to a head, when it was found that power was one of the most basic requirements of all war-time demands. The Indian Industrial Commission, while reviewing the power position during 1916-18, emphasized the need for a survey of the hydro-electric resources of India, since the entire industrial future depended upon the provision of cheap power. It further recommended that the survey be carried out forthwith by Government, since only they could estimate the effect of displacing communities under reservoir schemes, ascertain long-term rights, adjust conflicting claims, initiate and carry through joint and inter-dependent power and irrigation schemes, and most important, afford to conduct the long-term gauging operations which were so essential for hydro-electric projects. The Commission also pointed out that unless a systematic survey was undertaken by Government, it would not be possible to formulate precise rules for grant of concessions.

Acting on these recommendations, a survey of the hydro-electric resources of the entire country was initiated in 1919 under the auspices of the Central Government and was conducted on a country-wide basis for a short period of three years. This represented the first evi-

dence of Government's direct interest in the field of electricity development, either at the Centre or in the Provinces, and led to a preliminary assessment of the water power resources of India, which, for the territories now forming part of the Indian Union was placed at 3.5 million kw. continuous, on firm basis. Although unduly pessimistic and severely inhibited by the limitations of technology at that time, this survey represented a valuable first step undertaken at a timely stage. Unfortunately, in 1920 the Government of India, as a consequence of the Montague-Chelmsford Reforms, decided that all outlay on water storage and water power would be a provincial charge and ruled that the necessary provision for hydro-electric surveys should be made in the provincial estimates from the year 1921-22 onwards. This marked the end of direct participation by the Central Government in the field of power development till World War II. Although some Provincial Governments evinced interest in a few selected schemes, the aims and objects of a nation-wide survey of total resources were soon lost sight of.

The period after 1921 was, however, important because some enterprising Provincial Governments *viz.*, Madras, U. P. and the Punjab entered the field of power development with pioneering hydro-electric projects, *viz.*, Pykara, Papanasam and Mettur in Madras, the chain of power stations utilizing the falls along the Ganga Canals in U.P. and Jogindernagar in the Punjab. Grid systems emerged as power was carried from these hydro stations to remote load centres. The Princely States of Mysore and Jammu and Kashmir expanded their hydro stations and the State of Travancore also joined in the development of hydro power. The Tatas, the great industrial *entrepreneurs*, expanded their hydel stations along the Western Ghats. Expansion of thermal stations continued on load centre basis, as a preserve of private enterprise, operating under licences for production and distribution of power in urban centres. In addition to expansion of the then existing thermal power stations at Calcutta, Madras and Kanpur, new installations were commissioned in Bombay, Lucknow, Allahabad, Delhi, Agra etc. The total power plant capacity in the entire country at the beginning of World War II was about 1.2 million kw. to which State-owned electric utilities contributed about 76% of the total.

During World War II, all the available power supply resources were strictly controlled and regulated from the point of view of the war effort. Expansion of the industry was stifled considerably during the war period and shortly thereafter. At the time of independence, the installed capacity stood at about 1.7 million kw.

**The Electricity Supply Act of 1948:** As pointed out earlier, the Indian Electricity Act of 1910, introduced during the infancy of the electricity supply industry, was not specifically aimed at promoting rapid

development. This inadequacy, pointed to the need for additional legislation and for promotion and rationalization of power development. With the rapid growth of electricity during the post-World War I years, the concept of co-ordinated operation of electricity stations by forming grid systems, and the advantages of centralizing direction and control of bulk supply of energy by a single authority were recognized as essential for fostering healthy and economic growth of electricity. These new concepts introduced by technological advancement in the field were considered in detail by the Power and Fuel Sub-Committee of the National Planning Committee set up in 1940 under the chairmanship of Jawaharlal Nehru. This Committee, in its resolution, recommended the creation of Central and Provincial Electricity Boards to implement national policies on power. It also considered that it would be advantageous if Government were ultimately to own and operate the entire electricity supply industry. The Policy Committee on Electricity and Public Works of the Government of India also recommended in February 1945 that "Steps should be taken to eradicate any factors that retarded the healthy economic growth of electrical development on regional lines whether in the Provinces, States and Local Authority-owned or in commercially-owned electrical undertakings." It was then decided that the needs of the country would best be met by the constitution in the Provinces of quasi-autonomous statutory boards provided with adequate powers to effect the rationalization of electricity supply throughout the Province. Since it was not possible to legislate for this purpose within the framework of the 1910 Act, which had been conceived for an entirely different purpose, specific additional legislation on the broad lines of the Electricity (Supply) Act of 1926, in force in the U.K. at that time, was thought advisable. Accordingly, a bill was introduced in 1946 in the Central Legislative Assembly and its provisions discussed at a conference of prominent representatives of the Assembly as well as of industry and Provincial Governments in the summer of 1947. The bill finally drawn up was referred to a Select Committee of the Central Assembly in December 1947. The revised bill incorporating various amendments and modifications was introduced in the Constituent Assembly (Legislative) in 1948, and passed as The Electricity (Supply) Act, 1948. This Act provides for the establishment of a Central Electricity Authority and for organizations in the States, known as "State Electricity Boards." It also lays down principles for the control of finance of public electricity supply utilities.

The Central Electricity Authority, provided for in the 1948 Act, and constituted in January 1950, is statutorily empowered to:

- (a) develop a sound, adequate and uniform national power policy and particularly to co-ordinate the activities of planning agencies

in relation to the control and utilization of national power resources,

- (b) act as arbitrator in matters arising between the State Government or Boards and a licensee or other person as provided in the Act,
- (c) carry out investigations and collect and record data concerning the generation, distribution and utilization of power and the development of power resources, and
- (d) make public from time to time information secured under this Act and to provide for the publication of reports and investigations.

Some of the functions of the Central Electricity Authority, like collection and publication of statistics pertaining to the electricity supply industry, etc., are discharged for and on behalf of the Authority, by the Power Wing of the Central Water and Power Commission, the technical organization of the Union Ministry of Irrigation and Power. The latter organization was formed by amalgamation of the Central Electricity Commission (1948 to 1952) with the Central Water Power, Irrigation and Navigation Commission in 1953.

The State Electricity Boards provided for in the 1948 Act are semi-autonomous bodies empowered to control and regulate power development in the areas under their jurisdiction with the following specific functions:

- (a) to rationalize the production and supply of electricity in any area by preparing and carrying out schemes in which provision may be made for all or any of the following matters, viz.,
  - (i) the establishment of the Board's own generating stations;
  - (ii) the designation with the consent of the owner of generating stations, whether existing or new, as controlled stations at which electricity shall be generated for the purpose of the Board;
  - (iii) the inter-connection, by means of main transmission lines to be constructed or acquired by the Board, of any generating station with any others and with any system of licensees;
  - (iv) where a scheme relates to a specified area, the inter-connection of the system of the Board in that area, with the system of the Board in any other area with respect to which a scheme is being or may subsequently be made;
  - (v) the construction or acquisition with the consent of the owner of such other main transmission lines as the schemes may require;
  - (vi) the use by the Board of any transmission lines or main transmission lines of any licensee with his consent;
  - (vii) such supplemental, incidental and consequential provisions

as may appear necessary or expedient for any of the purposes aforesaid;

- (b) to supply electricity to owners of controlled stations and to licensees whose stations are closed down under the Act, and
- (c) to supply electricity as soon as practicable to any other licensees or persons requiring such supply and whom the Board may be competent under this Act to supply.

One of the important features of the Electricity (Supply) Act of 1948 is that it lays down the financial principles to regulate the commercial working of electric licensees. It introduces the concept of ensuring power supply — a basic need — at economical and reasonable rates, by the provision that the clear profits of a licensee shall not, as far as possible, exceed the amount of "reasonable return". If such a return is not, however, realized by a licensee, a procedure has been outlined by which the licensee could then extend his schedule of rates.

The Delhi State Electricity Board was the first to be formed in 1950, followed soon thereafter by the Madhya Pradesh Board. The Bombay State Electricity Board was formed in November 1954. There was considerable reluctance initially on the part of some States to form Electricity Boards. The question was discussed at a meeting in the Ministry of Irrigation and Power on February 16, 1955, at which it was decided that all the States should constitute the Boards as required under the Act. Thereafter, State Electricity Boards were constituted in the rest of the country. Although State Electricity Boards have since been set up in all States except Jammu and Kashmir, their historical background and experience have varied widely, as should have been expected in a large country like India, and their performance — in their main objective of fostering electricity development — is likewise diverse. While most Boards have comprehensive functions of power generation, transmission and distribution under their charge, in a few cases, investigations and construction of power generation schemes continue with the State Government Departments. In others, private utilities still continue to generate and distribute power in lucrative urban areas. The full objectives of constituting State Electricity Boards have, therefore, yet to be achieved.

**Period of Planned Development:** After 1950, the electric power industry, whose growth was slow and halting for nearly half a century, received great impetus. Major river valley developments taken up after independence for multi-purpose benefits, with power generation as one of the major aspects, contributed substantially to this boost. In the following era of planned development, and with emphasis on rapid industrialization, electricity supply became even more important. Power development has generally kept pace with these rapidly growing

demands and during the last twenty years, there has been a seven-fold increase in the installed capacity.

The basic approach of the Electricity (Supply) Act of 1948 was to promote electricity development, through tariffs which assured only a reasonable return on investment. More recently, in view of the capital intensive nature of the power supply industry and paucity of financial resources, the view has been expressed and gaining ground that electricity supply undertakings should earn reasonable surpluses also to provide resources for future development towards which end electricity tariffs and duties should be readjusted. A committee, mainly of State Ministers, was set up to examine these and related issues in June 1964. Their report submitted in October 1964, points out that the general financial conditions of most Boards, not being satisfactory, an overall objective of achieving a net return of 3% on the capital base may be aimed at in two successive stages. The question of amending the Electricity (Supply) Act of 1948, to bring it in line with recent thinking is currently under active consideration of Government.

With the institution (in 1950) of the Planning Commission — whose role in overall planning of all national activities, impinges on those of the Central Electricity Authority — the *de facto* position is that the responsibility for planning and co-ordinating developmental activities rests with the Planning Commission, and is mainly exercised through the Ministry of Irrigation and Power and its technical department, the Central Water and Power Commission. The question of strengthening the Central Electricity Authority is also currently under consideration of Government.

## II. Role of Coal, Hydro, Oil and Gas and Nuclear Resources

**Coal:** Coal has played the most significant part in the development of industrially advanced nations from the earliest stages. Though oil and gas have recently been rapidly substituting coal, it still forms the main source of energy in the world today. In India, coal has always been the backbone of the commercial energy supply, its production increasing steadily from about 6 million tonnes at the turn of the century to about 35 million tonnes in 1950 and about 80 million tonnes in 1970. Thermal power stations in 1969-70 in utilities, with an aggregate installed capacity of about 7,200 MW consumed about 17 million tonnes or about 21% of the total coal production in the country. Their output of about 27,000 million kwh. corresponded to a little more than half the total electricity produced in the country that year, more or less in keeping with past trends. Reliability of supply, limited outlays, and relative flexibility of location have been the main advantages of thermal genera-

tion in the past. Great advances in technology have taken place in thermal power generation during the past 50 years, leading to lower installation costs and vastly improved efficiencies of energy conversion. Further improvements, including operation at super critical pressures and higher temperatures, development of very large sized generating units, rated at over one million kw. each are being perfected. Thus, although facing increasing competition from the rapidly growing field of nuclear power generation, electricity production through coal-fired thermal stations is expected to continue to play an important role in the production of electricity. In fact, there are compelling reasons, peculiar to the coal industry in India, which necessitate continued reliance to a substantial extent on this form of electricity production.

It is known that coal has been used both as a fuel and for reducing iron ore in India from ancient times. The earliest exploitation for commercial purposes dates back to 1774 when a private company was granted permission to raise and despatch coal from large areas at Sita-rampur in the Raniganj field. The work was, however, abandoned soon, and thereafter no further prospecting was done till 1840, when with Government assistance, a mine was opened at Egra near Raniganj. In the early stages, development was slow mainly due to the lack of transport facilities, the only means of reaching the Calcutta market being navigation along the Damodar river during the monsoons. The expansion of the East India Railway during the mid 19th century, was followed by steady progress, the total coal production rising to about 6 million tonnes at the turn of the century, out of which Raniganj alone contributed 2.55 million tonnes. Several coal mines were also opened up in the erstwhile Central Provinces and Hyderabad State during the latter part of the 19th century. At the beginning of the First Plan in 1951, the annual coal production in the country was about 35 million tonnes entirely by private enterprise.

The need for rapid expansion in coal production to meet the demands of transport, industry and other sectors was recognized early and in order to accelerate the development of new coal mines and rationalize production, a corporation — The National Coal Development Corporation (NCDC) — was set up in the public sector in 1956. At the end of the First Plan, coal production stood at 40 million tonnes and this figure was further increased to 56 million tonnes at the end of the Second Plan, out of which 40 million tonnes was by the private sector and 16 million tonnes by the public sector. About 41 million tonnes (or 3/4 of the total) came from the Bengal-Bihar coal fields, and the balance from outlying coal fields — 6.2 million tonnes from those in Madhya Pradesh, 2.6 million tonnes from Andhra Pradesh, and the rest from small mines in Assam, Orissa, Maharashtra, Rajasthan and Jammu and Kashmir. Of the total production, about 4.7% came from deep underground mines

at depths over 305 meters about 74.5% from shallow underground mines, and the balance of 20.8% from open cast workings. Coking coal — entirely raised in Bengal-Bihar — accounted for 16.89 million tonnes or about 30% of the total. Despite raisings from outlying coal fields, the large deficits of the western and southern regions, had to be mainly met from Bengal-Bihar, with inevitable long hauls. The average ash content of all Indian coal raised in 1960-61 was about 25% and that of coking coal about 23%.

At the end of the Third Plan, the production was of the order of 70 million tonnes. The target for the Fourth Plan has been set at about 93.5 million tonnes.

India's coal reserves are yet to be intensively explored in their entirety. The Geological Survey of India is at present engaged in the task of a systematic assessment of these reserves through a committee on the assessment of coal resources appointed by the Coal Council of India. An estimate of about 106,000 million tonnes of proved, indicated and inferred reserves upto a depth of 609 meters in the case of most of the coal fields and 1,219 meters in the case of some of the collieries, specifically Raniganj and Jharia, has been indicated recently. The coal fields are mainly concentrated along a belt that runs from the eastern part of the Damodar Valley towards Central India, down to the Godavari Valley. In addition to these reserves of coal, there are reserves of lignite around 2,060 million tonnes, most of which are located at Neyveli in Tamil Nadu.

In view of the fact that the reserves of coking coal are limited and these as well as high grade non-coking coals are required with priority in the industry and transport sectors, thermal plants have to rely mainly on lower grade or slack coals available in ample measure. Further, the high ash content of all coals, requiring upgrading by washing as an essential prerequisite to industrial and other uses, introduced large quantities of by-product coals (middlings) from washeries which can be utilized in power stations. Because the ash itself is deeply interspersed in the coal and is not so readily separable, there are difficulties in reducing the ash content by washing. A major programme of washing coal is currently under implementation, with the object of supplying clean coal with an ash content of about 17% for coking purposes. The actual output of by-product coals, would depend upon the production of coking coal for metallurgical purposes, which, in turn, depends upon the targets for development of the iron and steel and other allied industries. At the end of the Fourth Plan, it is expected that about 6 million tonnes of these by-product coals would be available for power generation and these are expected to be fully utilized by the thermal stations in the Eastern Region, which are being designed to utilize these by-product fuels. Including these, the total coal consumption of all

thermal stations by the end of the Fourth Plan is expected to be of the order of 30 million tonnes.

From inception and during the entire first half century of growth, coal-based thermal generation comprised small load-centre installations supplying urban requirements of power at Calcutta, Bombay, Madras, Kanpur and other cities and towns. The first station was commissioned at Calcutta in 1899 followed by Madras and Kanpur (1906) and Delhi (1908), etc. These developments were exclusively by private enterprises which were freely allowed to expand their stations. Actual development upto World War I, was, however, extremely slow, the pace increasing somewhat thereafter. The installed capacity just prior to World War II was 540,000 kw. distributed among some 50 stations all of which were established and operated by private licensees.

There was a further spurt in activity following the end of World War II, when thermal stations in the urban centres continued to expand. The first major step in the development of economic thermal power through advantageously located large-mine-mouth installations was taken when the Damodar Valley Corporation (DVC) inaugurated work on the installation of the Bokaro Thermal Station with 3 generating units of 50 MW each in 1948-49. The total installed capacity of thermal plants in the utility sector in the country was increased from 1,004,400 kw. in 1951, to 1,546,800 kw. in 1956 and 2,436,255 kw. at the end of the Second Plan. The most important stations to be commissioned during this period were Bokaro (225,000 kw.) and Durgapur (150,000 kw.) in the DVC area, Trombay (187,500 kw.) and Chola-Kalyan (96,000 kw.) in the Bombay area, and Korba (99,000 kw.) in the Madhya Pradesh area.

The total installed thermal capacity including those of self-generating industries in the country increased to 5,560 MW at the end of the Third Plan and is expected to increase to about 12,700 MW as per the target for the Fourth Plan. Most of the recent additions to plant capacity have been in the public sector, as would be seen from the Table below:

TABLE IX  
Thermal Installed Capacity in kw.

|                                           | <i>Private<br/>Utilities</i> | <i>Public<br/>Utilities</i> | <i>Total<br/>Utilities</i> | <i>Private as %age<br/>of the total</i> |
|-------------------------------------------|------------------------------|-----------------------------|----------------------------|-----------------------------------------|
| 1. Prior to 1st Plan<br>(31.12.1950)      | 758,520                      | 245,914                     | 1,004,434                  | 76                                      |
| 2. At the end of 1st Plan<br>(31.12.1955) | 809,434                      | 737,368                     | 1,546,802                  | 52                                      |
| 3. At the end of 2nd Plan<br>(31.3.1961)  | 992,836                      | 1,443,419                   | 2,436,255                  | 41                                      |
| 4. At the end of 3rd Plan<br>(31.3.1966)  | 1,395,770                    | 3,019,515                   | 4,415,285                  | 32                                      |
| 5. At the end of<br>1966-70               | 1,302,500                    | 5,893,890                   | 7,196,390                  | 18                                      |

There has been a decided shift in the location of thermal power stations from urban load centres to pitheads. Obra (550 MW), near Singrauli collieris, Patratu (620,000 kw.) near Karanpura coal fields, Chandrapura (660,000 kw.), Durgapur (575,000 kw.), Bandel (330,000 kw.) and Santaldih (240,000 kw.) near Raniganj, Talcher (250,000 kw.), Satpura (312,000 kw.) and Neyveli (600,000 kw.) near coal fields of the same names, and Ramagundam (100,000 kw.) and Kothagudam (460,000 kw.) near Singareni collieris and Koradi (480,000 kw.) near the Pench Valley collieris are sites, at or close to collieris/washeries where the bulk of recent expansions completed/contemplated have been concentrated. These large mine-mouth washery stations, have very extensive extra high voltage grids, necessarily associated with them, to cover their large areas of reticulation. Sizeable investments are involved in developing these sites, arranging for water supply etc., and these major power stations are now being implemented mainly by the various State Electricity Boards.

The trend towards more rational development would also be seen from the Table below indicating the progressive increase in the unit sizes, to drive the twin benefits of reduced costs and improved efficiencies:

TABLE X

| <i>Year</i> | <i>Capacity of the biggest station in MW.</i> | <i>No. of stations above 200 MW capacity</i> | <i>No. of Units greater than 50 MW but less than 100 MW</i> | <i>No. of units greater than 100 MW (including 100 MW unit)</i> |
|-------------|-----------------------------------------------|----------------------------------------------|-------------------------------------------------------------|-----------------------------------------------------------------|
| 1. 1950     | 121                                           | —                                            | 1                                                           | —                                                               |
| 2. 1960     | 225                                           | 1                                            | 10                                                          | —                                                               |
| 3. 1970     | 600                                           | 14                                           | 43                                                          | 11                                                              |

The average gross efficiency of all thermal stations, which was only of the order of 16.3% in 1951 and 20.1% in 1961 has increased to 25.1% in 1969, steadily approaching the higher standards achieved in advanced countries where efficiency levels of the order of 40 to 43% have been reached.

The costs of thermal energy production depend on the cost of fuel and the load factors. They range in India from about 3 paise per kwh. at high load factor stations near the collieris to about 5 to 6 paise per kwh. at stations located about 966 km. from the collieris and operated around annual system load factors of about 60%.

An adverse feature of thermal development in the country so far has been the almost complete dependence on sources outside the country, both for the plant and equipment, and the engineering services required for designs and erection of plant. To minimize this to the extent possible, the Government has embarked on a programme of indigenous manufacture of equipment associated with thermal stations. Boilers are to be manufactured by both public and private sectors — the

Heavy Electricals at Tiruchirapalli in Tamil Nadu and A.C.C.—Vickers-Babcocks Ltd., at Durgapur. Steam turbogenerators will be manufactured by the Heavy Electricals at their Bhopal, Ramachandrapuram and Hardwar plants, where attempts are being made to standardize designs for overall economy in design, manufacture and operation. To undertake all the complex engineering works of design and erection, the various Central and State organizations are being strengthened and the growth of private consulting engineering organizations has also been encouraged. It is expected that, with these measures, the dependence on foreign sources for equipment and services would soon be eliminated.

**Hydro:** Hydel development gained momentum during the third and fourth decades of this century when State Governments undertook electricity development in the public sector. It has since steadily gained in importance with installed capacities varying from about 33-40% of the total electrical energy production since 1950. Their importance is due primarily to their fairly even distribution over the country, and relative economy. That they are inexhaustible perennial sources, and their low costs of production remain constant throughout the useful lives of these schemes, i.e. 100 years and more, are also vital factors. A compelling advantage is that they involve the least import component of all alternatives for electricity production, since the bulk of the investments are on civil works, e.g., dams, water conductor systems and power stations which are designed and constructed almost entirely indigenously. The total hydro energy generation in 1969-70 at 23,000 million kwh. represents utilization of only about 10.2% of the available resources. This is due partly to the fact that hydel developments involve relatively longer gestation periods — covering extensive periods of investigation and construction work at remote sites — and quite often solution of complex problems associated with riparian rights and inter-State aspects. Long-term perspective planning is expected to overcome these limitations and lead to a quicker pace of utilization of hydro resources.

Hydel generation was initiated in India in 1897 through a 130 kw. station for municipal town lighting in Darjeeling (West Bengal). In 1902, the Mysore Durbar set up the first major station at the famous Cauvery falls at Sivasamudram (4,500 kw., raised to 15,700 kw. by 1920), to supply power to the Kolar Gold Mines. It was also the first industry-oriented power scheme. In 1909, the Kashmir Darbar inaugurated its 4,000 kw. Jhelum Station at Mohora near Srinagar. Municipal stations for town lighting were installed at Mussoorie (450 kw.) in 1913. Among these early developments, the 50,000 kw. Khopoli Scheme pioneered by the Tatas in 1914 to meet the electricity demands of Bombay City, and which involved westward, trans-basin diversion of waters of the

tributaries of the Krishna river to utilise a fall of 500 meters, was easily the most impressive. At the beginning of World War I, the aggregate capacity of hydel installations in the country stood at 70,000 kw.

Shortly after World War I, the Tatas followed Khopoli with a similar 72,000 kw, Bhivpuri Station in 1920 and the 110,000 kw. Bhira Station in 1927, in the same area, to meet growing demands of the city. Mysore State increased the capacity of Sivasamudram to 42,000 kw. in stages and followed it up with the 17,200 kw, Shimsha Hydel Project nearby in 1940. During the late twenties, several Provincial Governments undertook hydel development under public ownership. In 1931, Tamil Nadu (Madras) launched its Pykara Scheme — in the Nilgiris — with an initial capacity of 18,750 kw., utilizing a fall of 1,000 meters, one of the highest in the world then, —and followed it up with a 30,000 kw. power station at the toe of the Mettur Dam, which was constructed to extend irrigation under the time honoured canal system of the Cauvery delta. Uttar Pradesh developed the falls along the Ganga Canal with a chain of 7 power stations with an aggregate installation of 18,900 kw. from 1927 to 1937. The Punjab inaugurated its 48,000 kw. Jogindernagar Station (now in H.P.) in the Beas Valley in 1933. Kerala (Travancore) undertook systematic development of the steep Mudirapuzha of the Periyar river system, commissioning the Pallivasal Station with an initial capacity of 13,500 kw. in 1939. Through these efforts, the aggregate hydel capacity increased to 470,000 kw. in 1940, and during the period 1940 to 1947, little progress was made, the only addition being 21,000 kw. at Papanasam in Tamil Nadu, and 48,000 kw. at Jog in Karnataka. It is noteworthy that most of these installations were single-purpose in character conceived for and financially justified entirely by their power benefits.

After 1947, Central and State Governments initiated programmes of development, in which multi-purpose river valley projects—primarily for irrigation, flood control and power generation — constituted an important corner-stone. The Bhakra Project, intended to irrigate about 1.62 million hectares of land, and with an aggregate plant capacity of 1,204,000 kw., was one of the earliest to be taken up, and its last phases of development are still under execution. The 660,000 kw. Beas—Sutlej Link Project and the 240,000 kw. Pong Dam Scheme currently under construction are sequels to this major step in the economic development of the region. Almost simultaneously with the Bhakra Project, the first phase of the Damodar Valley Project envisaging construction of four dams at Tilaya, Konar, Panchet Hill and Maithon for the prime purpose of controlling the devastating floods of the Damodar, but with ancillary facilities for production of 104,000 kw. of power and extended irrigation to 10.28 lakh acres, was taken up and this phase of development has been substantially completed. The Hirakud Dam Project in

Orissa — with a projected installed capacity of 270,000 kw. and irrigation command of 2.4 lakh hectares — was taken up in 1948 as the first of a series to harness the large water resources of the Mahanadi river. Systematic development of the resources of the Chambal river was taken up in 1953 in Madhya Pradesh and Rajasthan to provide 386,000 kw. of power and irrigation to 5.7 lakh hectares. The other important multiple-purpose projects taken up and completed are the Tungabhadra in Karnataka/Andhra and Bhadra in Karnataka, under construction are the Parambikulam Aliyar Project of Tamil Nadu, Ukai in Gujarat and Ramganga in Uttar Pradesh. These multi-purpose projects have contributed substantially to the rapid growth of hydel installations since 1955.

Besides these multi-purpose projects, a number of power projects, single-purpose in character, were also implemented all over the country since 1947. The 115,000 kw. Machkund Station in Andhra Pradesh and Orissa was completed in 1955, and this scheme has fostered development lower down the Sileru Valley at Upper Sileru (120,000 kw.) which has been completed and Lower Sileru (300,000 kw.) and Balimela (240,000 kw.) which are currently under active development. In Tamil Nadu, the 36,000 kw. Moyar Scheme was completed in 1952 and this was followed up by the 140,000 kw. Periyar Station in 1958, which has also been completed. The cascade of five stations of the Kundah Project utilize a total fall of about 1,900 m. Kerala implemented the 48,000 kw. Sengulam Station in 1954, and 32,000 kw. Poringalkuthu Station in 1957. The last in the chain of Mudirapuzha developments, Nariamangalam (45,000 kw.) and Penniar (30,000 kw.) were commissioned in 1960-61 and 1963-64 respectively, and the Sholiar (54,000 kw.) Scheme in 1968-69. Also the 300 MW Panba-Kakki (Satirigiri) Project was completed in 1967-68. At present the 390 MW Idikki Project is under construction. In Karnataka, all efforts were concentrated on the giant 890,000 kw. Sharavathi Project — one of the most economical sites in the country where the first unit of 89,000 kw. was commissioned in 1964 and 712,000 kw. capacity has so far been commissioned. The main 240,000 kw. Koyna Station was commissioned in Maharashtra in 1961, and has since been followed by the 300,000 kw. second stage development of the same project. In Uttar Pradesh, the 300,000 kw. Rihand Project was commissioned in 1961-62 and has been followed up by the 100,000 kw. Obra Station, and the first stage of the Yamuna Valley Development (84,000 kw.) The further stages of the Yamuna Valley Development with an aggregate installed capacity of 390,000 kw. is presently under construction. In Assam, the 8,400 kw. Umtru Station commissioned in 1956 has been followed by the recently completed Umiam-Barapani Project (54,000 kw.). Besides these, three Central sector hydro-electric projects viz. Siul (180 MW) in Himachal Pradesh, Salal (270 MW) in Jammu and Kashmir and Loktak (70 MW) in

Manipur are at present under construction for regional benefit. When most of the major developments now underway are completed, about 18% of the country's total hydel potential would have been developed.

The firm hydel potential of India's rivers was placed at around 1.5 million kw. continuous (18,400 million kwh. of annual energy output) by J. W. Meares, the then Chief Engineer, Hydro Electric Survey of India and Electrical Adviser, in 1921. This was long known to be a serious underestimate but no systematic reappraisal was carried out till the Central Water and Power Commission (Power Wing) conducted a comprehensive survey from 1953-58 through which the total firm hydel potential, comparable of economic exploitation, was placed at 41.15 million kw. (corresponding to an annual energy output of 216,000 million kwh.) based on 260 specific schemes. The latest assessment takes into account all practical limitations on development such as reservoir storage due to submergence and other priority uses for flood control etc., abstractions of river flows for irrigation, reservoir operation for other uses and those set by economic considerations. It leaves room for slight upward revision only in the Upper Himalayan ranges.

Of the country's total potential, about 10,300,000 kw. represents the potential of simple "run-of-the-river" type projects in the Himalayan ranges and the rest of "storage type" projects. "high head" type projects utilizing drops over 300 m. — account for about 13,630,000 kw.; "medium head projects" in a head range of 30-300 m — account for 23,860,000 kw., the bulk of the total; and "low head projects" — ranging from 7.5 m. to 30 m. — form the smallest category with a total of about 3,660,000 kw.

India's hydel resources are fairly evenly distributed all over the country, there being few regions which are situated more than 480 km. from major concentrations of hydro power. The north-eastern region covering Assam and NEFA, (now Arunachal Pradesh) endowed with the most favourable relief, and unfailing fast flowing Himalayan streams and rivers of the Shillong plateau which drawn in the heaviest precipitation in the world, naturally has the highest potential estimated at 11,600,000 kw., of which only 2,570,000 kw. depend on reservoir storage. The bulk of the utilizable power potential of the Himalayan rivers are located all along the foot-hills and command the entire Indo-Ganga and Brahmaputra plains. The most important concentration of potential hydro power beyond the region of influence of these Himalayan sources, lies in the high ranges of the Eastern Ghats, where tributaries of the Godavari have an aggregate potential of about 6,148,000 kw. The potential of the Western Ghats aggregate to about 4.7 million kw. of which about 2.7 million kw. lie in the north-western corner of Karnataka State, the balance being in the Nilgiri and Anamalai (Cardamom) ranges of Tamil Nadu and Kerala.

The economics of hydel development involve consideration of a large number of factors, which vary considerably from site to site, and normally no generalization is easily possible. Development costs vary from time to time. Allocation of costs of common works of multiple-purpose schemes affording several benefits, is complex. These difficulties are further enhanced by the fact that hydel sites have different values and potentialities when operated in isolation and in co-ordination with other stations of a large inter-connected grid. Generally, however, it would be accurate to state that the costs of hydro energy generation vary almost in direct proportion to the investment per kw. of firm capacity, at a rate, which taking into account prevailing interest rates would, in general, not exceed 9%. The cost of energy production from various schemes in operation today generally varies from about 2 paise per unit to 4 paise per unit. The costs of development of hydro power during the next two decades is expected to fall well within this range, taking into account the relative magnitudes of the works involved on these projects and their costs.

While on purely economic consideration, hydro resources should have played a greater role in development of electricity supply in this country, an important handicap in the past has been the lack of sufficient number of investigated schemes capable of timely implementation to meet rapidly growing demands for power. Two important decisions taken in the early sixties by the Government of India are expected to improve the situation and hasten future development. The first was in regard to preparation of long-term Perspective Plans, within the framework of which, hydel schemes, involving relatively longer gestation periods, could be suitably dovetailed. The second was the decision to embark on a country-wide scheme of extensive field investigations of hydel projects, so that fully investigated schemes would be available well ahead of time for implementation under the country's Five Year Plans. Special assistance in procuring drilling and other equipment required for this purpose is being obtained under a programme of assistance from the U.N. Special Fund. The first phase of this work of country-wide surveys covering about 62 schemes, out of the various potential sites pin-pointed by the Hydro-electric Survey of India, when completed, will not only remove an important lacuna, which hampered development of hydel power in the past but also pave the way for rapid detailed surveys of the rest of the schemes, and enable a more exact appraisal of the entire hydro resources of the country.

**Oil And Gas:** During the last few decades, oil and gas have been playing increasingly important roles in the industrially advanced countries in the energy field. The ease and efficiency with which they can be handled has been primarily responsible for their pre-eminent role.

However, in the particular field of electricity production — where alternatives are available — the important influencing factor, apart from availability of indigenous resources, is their cost. In this context, it is worthy of note that even in countries rich in oil and gas resources, these have not been used to any large extent for electricity production compared to other resources. India is disadvantageously placed both in respect of availability of resources of oil and gas and their costs. The impact of oil and gas on electricity development till fairly recently has, therefore, been negligible, being limited to small diesel driven generators, used either as nursery units to built up demands for emerging grid systems or to meet local requirements of electricity at isolated points beyond the reach of other sources of power supply. To an extent, they have been used as emergency alternatives or as small ancillary sources to coal firing in boilers. Over the last decade, only about 5% of oil and gas consumption has been used for electricity production.

A major programme of expansion of refinery capacity has recently been undertaken to meet growing demands for various petroleum products. Some of the by-products of refineries such as furnace oil, pitch, refinery gas, naptha etc. could advantageously be used for electricity generation. Sizeable resources of gas which can also be used for power generation have also been recently discovered. These have stimulated some local interests in these resources for electricity development.

Oil can be used directly as fuel in prime movers driving electrical generators as in diesel installations or as fuel in power station boilers to feed conventional steam turbo-generator sets. While gas also can be used in power station boilers, its direct use in gas turbine driven generators is gaining application in specific situations.

At present, the total installed capacity of diesel installation in the utility and non-utility sectors is only about 400,000 kw. forming only about 1.5% of the total installed capacity. With the emergence of nation-wide power grids, these diesel stations are being shut down gradually and their capacity would soon become relatively insignificant.

After the setting up of refineries at Bombay, their by-products have been used for power generation at the 337.5 MW Trombay Station, though the station is not entirely dependent on these fuels. Similar stations to use by-product fuels of Koyali and Barauni refineries have been envisaged while building the 534 MW Dhuvaran Thermal Power Station in Gujarat and 145 MW Barauni Thermal Power Station in Bihar. Surplus fuel oil from the Koyali refinery is proposed to be utilized in the 217.5 MW of Sabarmati Station at Ahmedabad. The 30 MW power station under construction at Gauhati in Assam and the 400 MW power station sanctioned for construction at Ennore near Madras will also use by-products from refineries close by.

The 69 MW gas turbine power plant at Noharakatiya in Assam is the

first station in the country to use the naturally available gas in gas-turbine driven generating units. The main advantages of this type of installations are their low capital costs and ease of construction and operation. They are also ideally suited for intermittent operation for peak loads as they can be started and stopped quickly. The major disadvantages are their poor efficiency and higher costs compared to conventional steam stations. As such, they are selected generally either for installation in areas where the fuel is very cheap or to meet demands due to unexpected rate of load growth. Recently, it has been finding wide application to meet system peak demands which occur only for short periods during the day.

Two gas turbine units, 27 MW each, have been recently installed in Gujarat. Two units of 10 MW each at Hyderabad to meet emergent requirements and peak loads in Andhra Pradesh and two more units of 12 MW each, one at Gauhati and one at Muradnagar in Uttar Pradesh have been installed. These units are designed to operate on petroleum products like furnace oil.

Future trends in the use of oil and gas for electricity production have to be seen in the context of our resources and present pattern of use. It was only during the Second Plan, which emphasized industrial development, that an intensive programme of exploration of the country's oil and gas reserves was initiated and some notable discoveries made. India has an area of about one million sq. kilometers of sedimentary rocks which theoretically may be taken as 'potential for oil'. These sedimentary regions are located along the vast Indo-Ganga and Brahmaputra plains, around the Gulf of Cambay and the Rann of Kutch in Gujarat, along the west coast between Bombay and Goa, along the Kerala coast and along the eastern coast of Tamil Nadu, Andhra Pradesh and Orissa. Of the regions explored for oil and gas so far, the most promising are those in Assam and Gujarat. The proved and indicated recoverable reserves of oil, according to present knowledge, have been estimated at about 150 million tonnes, almost all of which are located in Assam and Gujarat. Gas reserves in these fields are estimated at 63,600 million cubic metres.

Prior to independence, indigenous production of crude oil and its refining was restricted to a small oil industry near Digboi in Assam. Subsequent developments have been at a relatively rapid rate and, in 1968-69, India produced about 6 million tonnes. This is expected to increase further to around 8.5 million tonnes per year by 1973-74. India has at present a refining capacity of about 17 million tonnes per year. The refining capacity is proposed to be expanded to 26 million tonnes per year by 1973-74.

India's petroleum industry is being rapidly expanded to meet mainly the growing demand for petroleum products in the transport, indus-

trial and domestic sectors. Even to meet these essential requirements, the present picture is that reliance has to be placed heavily on imports. As such, oil and gas are not expected to play a significant role in power development in India and would be limited, as in the past, to the use of by-product fuels from the expanding refinery industries which are surplus to other essential uses.

**Nuclear Resources:** In 1945, the world first became aware of a new and apparently unlimited source of energy through the nuclear explosions at Hiroshima and Nagasaki in Japan. During the subsequent two decades, vast strides have been taken in the technology of harnessing this energy for electricity production, which have brought it within the realm of economic feasibility. Nuclear reactors have now been developed in which heat is derived in a controlled manner, and utilized thereafter to generate steam for use in conventional turbo-generators. That this discovery has not come a day too soon would be apparent when one is confronted with the staggering energy requirements to sustain, for a population as large as India's, a standard of per capita consumption prevailing today in the advanced countries of the world. India's conventional resources of electric power fall far short of these requirements. Apart from its importance as a new source of energy, its special significance for energy deficient areas lies in its relative freedom from the geographical limitations imposed on development of conventional resources, like water power and the mine-head thermal stations.

Nuclear energy stems from the destruction of mass during nuclear disintegration, or fission, the transformation following Einstein's well-known equation  $E = mc^2$ , according to which the energy equivalent to conversion of 1 lb. of matter is 11,000 million kwh. or roughly the output of a 200,000 kw. power station, when run continuously, for six years. However, it is only a very rare isotope of uranium (U235) — with an occurrence of 1 part in 140 of natural uranium (U238), itself not too abundant in nature — which is fissible, i.e., capable of such fission. The separation of this isotope, constituted the most challenging aspects of nuclear technology. The relatively more plentiful natural uranium (U238) and thorium (U232) are also equally important since they are "fertile", i.e., they are capable of being rendered "fissible", by nuclear bombardment, when, by neutron absorption, they are transformed into plutonium (U239) and an isotope of uranium (U233). The development of nuclear energy centres round fuels with varying concentrations of these isotopes of uranium, U233 and U235, and plutonium (U239).

Unlike the conventional methods of electricity production, where the energy value of potential water power resources and of fossil fuels, can be readily assessed on the basis of well established conversion factors,

in the nuclear field, the energy that can be obtained from a given quantity of nuclear fuel, varies substantially with methods of use.

It is well known that the only naturally occurring fissile material is uranium (U235), which occurs to the extent of 0.7% in natural uranium. Thus, if one of the inert (fertile) uranium is converted into fissile material, a tonne of natural uranium will yield energy equivalent to about 21,000 tonnes of coal. The know-how reserves of uranium in India upto 1956 was 15,000 tonnes. On this basis, equivalent energy would be about 315 million tonnes of coal.

But in the course of liberating atomic energy, the fertile materials uranium (U238) and thorium (U232) can be converted into the fissile materials, plutonium and uranium (U233) respectively.

As an average figure for a reactor working on natural uranium, one may assume that new fissile material is produced equivalent to 80% of the fissile material burnt. The total energy released from a tonne of natural uranium is then increased by a factor 5.

Since it is the intention in India to avoid the construction of a gaseous diffusion plant, it is clearly necessary to set up in the initial stages atomic power stations which operate on natural uranium and effect the maximum conversion of fertile to fissile material. This pure or enriched material could subsequently be used in breeder power stations (where the fissile concentrations of fuels increase with use due to higher rates of conversion of fertile material) thus enabling our entire reserves of uranium and thorium to be utilized for power production. On this basis, the reserves of uranium and thorium indicated are equivalent to 600,000 million tonnes of coal.

For practical and economic reasons, therefore, the spent fuels of nuclear reactors, after specific periods of Irradiation in the reactors cannot be discarded as those from conventional stations, but have to be taken out and specially reprocessed progressively to recover their unused fissile components. The extent of fuel "burn up", while they are in the reactors, and of conversion of fertile material into fissile ones varies with the type of fuel used, its degree of enrichment, the type of arrangements to moderate and control nuclear reactions, and several other factors, and these have all to be taken into account in any assessment of the practical value of nuclear fuels. While such a detailed examination is beyond the scope of this review, it is interesting to note that in the type of reactor proposed to be installed at Rana Pratap Sagar, 2,000 tonnes of uranium are expected to be adequate for a 1,000,000 kw. power plant, for operation at a load factor of 75% for 20 years.

In 1956, the total amount of uranium available in India was estimated at about 15,000 tonnes — 7,000 tonnes from the monazite sands of Kerala, 4,000 tonnes from the Singhbhum fields of Bihar, 3,000 tonnes from the Aravali fields, Khetri, Dariba, Khandela, etc., the rest representing addi-

tional reserves from the above uranium fields, available at less economic rates. The resources of thorium were then placed at about 150,000 to 180,000 tonnes from monazite sands.

Recent investigations have shown that the uranium deposits in Bihar, Rajasthan and Tamil Nadu aggregate 30,000 tonnes. Thorium reserves have been revised upwards to 340,000 tonnes. These thorium resources have been described as equivalent to all the world's known uranium in ores, containing 0.1% and above. It has, however, to be remembered that, while ultimately this thorium can be utilized, a number of problems involved in the conversion of thorium into fissible U233 remain to be solved. When this is done, India would indeed be very rich in sources for nuclear fuels.

The basic components of a Nuclear Power Reactor are (a) the core, where fission takes place, with its associated "moderation" and "control" systems; (b) the coolant systems to transfer heat from core to a heat exchanger, where it is used to raise steam for operation of conventional turbo-generators; and (c) a heavy shield surrounding the core and ancillary parts, to contain lethal emanations. Reactors can be fuelled either by natural uranium, enriched uranium — where the fissible content is artificially increased — or thorium. Those where "moderators" are used to slow down neutrons emerging at high velocities from fission reactions, are called "Thermal Reactors", whereas others, without moderators, using fast neutrons, are known as "Fast Reactors". There are "Homogenous" type, where the fuel is intimately mixed with the moderator and the "Heterogenous" type, where the fuel is in the form of individual blocks located at intervals within the moderator. The moderator itself can be either of light water, heavy water, or graphite. Carbon dioxide, water liquid sodium, etc., offer alternatives for cooling. The fairly wide choice of fuels, moderators and control systems, and coolants, give rise to a very large array of possible reactor types, from which a choice has to be made of the most advantageous techniques for indigenous development. This choice of technique is influenced, not inconsiderably, by the ancillary facilities required for production (including enrichment) of fuel, its chemical reprocessing, disposal etc., all of which require very substantial investments and technological skill.

The broad strategy of development of nuclear power in India has been influenced by the decision to avoid construction of a gaseous diffusion plant for separation of U235 — in view of its heavy cost and large requirements of electricity — and, initially to concentrate, instead, on indigenous production of natural uranium fuels to be employed in special power reactors, which, besides affording heat for generation of electric power, would also enable conversion of fertile U 238 to fissile plutonium (U239). These first stage power reactors would provide sufficient fissile material for fabrication of enriched fuel elements for

- second stage power reactors of the fast type, with which it is expected that the far more abundant thorium U232 can be converted to fissile U233 for use in later stage reactors. In the third stage, when sufficient quantities of Uranium 233 are produced, they are proposed to be used in improved reactors of the "Breeder" type, where the rate of conversion of fertile material would be so high that the reactor would, in effect, produce more U233 than it would consume.

India's nuclear development programme has been broadly oriented to this method, and development work has been initiated by the Atomic Energy Department of the Government of India, set up in 1954 as the Atomic Energy Commission, on several fronts covering exploration and mining, fabrication, processing and re-processing of fuel elements and other related aspects. Over 7,000 scientists and technicians are engaged on this vast and rapidly expanding programme of work.

In 1958, the Planning Commission approved the inclusion of an atomic power station in the Power Development Programme of the Third Five Year Plan and to install it in the energy deficient western region of the country, to feed the power systems of Maharashtra and Gujarat States. After preliminary investigations, a suitable site was selected at Tarapur on the western sea board near the inter-state border. In May 1964, a contract was placed with M/s. G.E.C. of U.S.A. for construction of a two-reactor power station with an output of 380,000 kw. and had been commissioned in 1969-70. The total outlay on the power station is estimated at Rs. 68.3 crores. The Department of Atomic Energy of the Government of India has estimated that the cost of power from the station would be about 4.5 paise per kwh.

The second in the chain of power stations proposed to be set up in this country is to be located in another energy deficient region of the country i.e., Rajasthan, at Rana Pratap Sagar, on the foreshore of the Rana Pratap Sagar reservoir of the Chambal Valley Project. The station will ultimately house two reactors, with an electrical output of 200,000 kw. each, of which one reactor would be installed in the first stage. The cost of power generation from this station has been estimated by the Department of Atomic Energy at 5.5 paise per kwh. In the southern region of the country, which has scarce fuel resources, the hydro-electric resources, which have mainly substained power development in the early years, are being gradually fully developed to meet rapidly increasing demands. This is another region of the country which has been recognized as a potential energy deficient area for early initiation of nuclear power generation. Here, the Planning Commission has approved the proposal to build the third atomic power station with an output of 400,000 kw. at Kalpakkam in Tamil Nadu.

The Tarapur Atomic Power Station will be fuelled initially with enriched uranium fuel elements from the U.S.A. It is proposed to

fabricate subsequent replacement charges in this country, although enriched uranium would still have to be imported. The nuclear fuel complex being set up at Hyderabad will supply the initial and further replacement requirements of CANDU type stations likely to be set up in the future. The projected nuclear fuel complex at Hyderabad will cover the entire range of operations from raw mineral concentrates to finished fuel elements and other reactor components for power reactors of different designs. The heavy water-cum-fertilizer plant at Nangal, has been designed to produce heavy water as a by-product with an annual capacity of 14 tonnes. Plans are afoot substantially to increase the indigenous output of this most essential requirement for future power stations. Besides these activities, the Atomic Energy Department is actively implementing a large number of projects covering explorations, mining, extraction of materials, fabrication of fuels and material requirements, building up indigenous expertise all along the field. According to present anticipations, the total installed capacity of nuclear power stations at the end of the Fourth Plan would be of the order of 580,000 kw.

### III. Trends — Present and Future

At the end of March 1970, the total installed capacity of all power stations of the country was about 15.5 million kw., of which 14.1 million kw. was from utilities, the balance representing the capacity of industrial units, generating their own power mostly through thermal installations. Of the capacity of power utilities, private sector installations would aggregate to only about 1.6 million kw. or about 10% of the total. The break-up between thermal, hydro and diesel installations would be about 9.0 million kw., 6.1 million kw. and 0.4 million kw. respectively. Notwithstanding the massive increase of nearly 300% during the last decade in power plant capacity, the average per capita consumption of electricity of the country in March 1970, was only of the order of 84 kwh., varying from about 50 kwh. in Andhra Pradesh to about 255 kwh in Delhi territory. In comparison, the per capita consumption in some of the advanced countries in 1969 was 7,000 kwh. in the U.S.A., 3,700 kwh. in U.K., 2,400 kwh. in France and 2,630 kwh. in the U.S.S.R. Admittedly one of the most urgent needs of the country is to accelerate electricity development as rapidly as possible and ensure the most wide-spread benefits therefrom. According to present anticipations, the targets for total installed capacity in the country at the end of the Fourth Plan (1973-74) would be about 23 million kw., and at the end of the decade 1980-81 about 52 million kw.

The country has ample resources to sustain the large programme of development that lies ahead. The field, however, is capital intensive

requiring use of materials and equipment which are still in scarce supply, and require heavy imports. During the First, Second and Third Plans, the outlays on power including generation, transmission and distribution were of the order of Rs. 302 crores, Rs. 525 crores and Rs. 1,012 crores respectively, representing about 12.7%, 11% and 13% of the total Plan outlays. The import or foreign exchange component of these investments were of the order of Rs. 117 crores, Rs. 160 crores and Rs. 362 crores in these successive Plan periods. During the Fourth Plan, the outlay on power is Rs. 2,523 crores, representing 10.1% of the total Plan outlay. It is, therefore, clear that a rapid rate of growth can be maintained in future only on the basis of limiting outlays by choice of the most economic alternatives available and maintaining utmost efficiency of operation by system inter-connections and better use of existing plants. The broad strategy of development would be to rely on development of coal-based thermal power in and around the colliery areas, to develop available hydro resources to the maximum feasible extent, to rely on nuclear resources in increasing measure in the regions of the country where resources of conventional resources fall short of demands. On this basis, it is expected that at the end of the Fourth Plan and the decade 1971-81, the approximate contributions of thermal (including diesel plants), hydro and nuclear resources to the total would be as given below:—

TABLE XI

|                              | <i>Hydro</i> | <i>Thermal</i><br>( <i>Million kw</i> ) | <i>Nuclear</i> | <i>Total</i> |
|------------------------------|--------------|-----------------------------------------|----------------|--------------|
| End of Fourth Plan (1973-74) | 9.4          | 12.7                                    | 1.0            | 23.1         |
| End of Decade 1971-1981      | 22.0         | 25.8                                    | 4.2            | 52.0         |

While planning for future development, it is essential to note that the power resources of the country are so distributed that economic development cannot be ensured on the basis of Plans drawn up within the political division of the country into different States. On the thermal side, the need to utilize the by-products (middlings) of coal in large power stations would necessitate consideration of a wide area of reticulation, extending beyond the State boundaries around washery oriented sites. Similarly, if advantage is to be taken of the economic trend towards use of very large thermal installations, their zone of influence would again have to be based on purely economic considerations. In the case of hydel development, it is even more obvious that geographical considerations would have to predominate in the selection of schemes, and that the large and economic concentrations of hydel power, should be uti-

lized in the widest possible region, irrespective of the actual location of hydel sites with reference to State boundaries. These considerations have led to the concept of regional planning for power development in India with super grids, transmission networks, and distributing power in an economic manner throughout these regions. Closely integrated operation of all power stations in economic regions would result in a variety of benefits. They make it possible to keep reserve capacity to a minimum, and to maximize benefits from existing installations, reducing energy production costs in the bargain. They would enable the choice of the most economic sites for further development, adoption of larger sizes for reducing costs and attaining higher efficiencies, and last, but not least, they render invaluable assistance to stricken areas during breakdowns. These compelling reasons have led to general agreement on this aspect of power policy.

The country has now been divided into five main regions, and under the Central Electricity Authority, five Regional Boards have already been constituted. These are:

- (i) Northern Region comprising the States of Punjab, Uttar Pradesh, Rajasthan, Jammu and Kashmir, Himachal Pradesh and the Union Territory of Delhi.
- (ii) Eastern Region comprising the States of Bihar, West Bengal and Orissa.
- (iii) Western Region comprising the States of Gujarat, Maharashtra and Madhya Pradesh.
- (iv) Southern Region comprising the States of Tamil Nadu, Kerala, Karnataka and Andhra Pradesh.
- (v) North-Eastern Region comprising the States of Assam, Manipur and Tripura.

The general functions of the Regional Boards will be to :

1. plan generation and major transmission programme in the region taking into account the load anticipations;
2. advise on joint projects involving generation and major transmission to the extent necessary;
3. review the progress of projects in the region;
4. plan and ensure the efficient integrated operation of the constituent systems in such a manner that, at any given time, the total amount of electricity generated and transmitted shall give optimum benefits to the region as a whole;
5. develop generation schedules and the amount of power to be exchanged between the various power systems in the region from time to time;
6. work out a co-ordinated overhaul and maintenance programme of the generating plant for the entire region;
7. schedule exchanges with other Regional Power Agencies; and

8. lay down a suitable tariff structure which should govern the exchange of power within the region and with other regions and devise suitable machinery for billing and collection and settling of any disputes on this account.

The growth of these Regional Grids would represent a major step in the development of power resources in the country. The day is not far off, when these Regional Grids would, in turn, be inter-connected to form a single All-India Grid, traversing the length and breadth of the country and fulfilling an important socio-economic objective, i.e., harnessing all the natural resources available in an area or region as economically as possible, according to the latest known techniques, ensuring the utmost reliability of supply to the consumer wherever he may be situated.

## HUMAN RESOURCES AND THEIR DEVELOPMENT

### I. Human Factor and Economic Growth

Gross National Product (GNP) has been traditionally ascribed to the combined output of three productive factors, viz., land, labour and capital. This would be true for a static model or a stationary state of affairs. But when GNP is viewed qualitatively and dynamically over a period of time, it cannot be ascribed only to the three factors. A number of studies have indicated that the human factor also accelerates economic growth. Increases in the GNP can be explained, for the main part, as a return on the very heavy investment which all countries undertake at all times in the development of their human resources. This includes all expenditures — capital and recurrent — on all forms of formal education which invest human resources with knowledge and skill on all forms of mass media which circulate knowledge over a wide area, and on all forms of development and research. In developing human resources, the active agents of modernization are the human beings as they alone can accumulate capital, exploit natural resources and build political and social organization. In the ultimate analysis, it is on the development of people and the effective commitment of their energies and talents that the wealth and vitality of nations rest.

The two reciprocally related processes are the development and utilization of human resources. While the development of human resources essentially means the enlargement of personnel potential through the acquisition of beliefs, values, skills and knowledge, the utilization of human resources development is not only providing so many jobs for people but also providing jobs that will enable them to do what they are become capable of doing.

It has to be accepted that accelerated economic growth is to a large degree a function of adequate or commensurate development of human resources and that increase in the GNP has causal relationship with increase in investment in education, health, housing, scientific research, etc. Investment in human resources, to be productive, implies that all expenditure must be the result of a system of rational and integrated educational planning as a part of an overall and social development programme in a country. This involves, among other things, mapping the demand of all types of personnel over a requisite period of time, identifying the educational and training sectors which are hindering economic growth through either under-supply or over-supply of skilled personnel and concentrating investment in those sectors which need to

be expanded, bearing in mind the inter-related character of the different levels of education and training and educational pyramid, undertaking a qualitative appraisal of the content of education and training programmes and gearing them both to the humanistic values and traditions of society and to the development demands of the growing economy, particularly its innovation-mindedness, reducing rapidly and finally eliminating all forms of waste in the educational system.

The size, composition and socio-cultural characteristic of a population are the basic determinants of the pace and level of economic development. Not only do demographic forces influence the nature and quantum of all factors of production, they also determine the kind of economic climate within which all activity takes place. The constant inter-action between man and his environment has an effect on the size and quality of the natural resources base. Similarly, demographic and cultural factors are important determinants of the rate of capital accumulation. The quality of the human resources also plays an important role in determining the type of technology, the modes of organization, and the targets of production. Human resources (or the total population) have a two-pronged relationship with economic development. As a resource, people are available as factors of production to work in combination with other factors. As consumers, the goal of economic development is to maximize realization of their desires and aspirations. Thus, economic analysis has to consider the human element in both its roles as producer and as consumer.

## II. Indicators of Human Resource Development

It would be useful to identify quantitative indicators of human resource development and to find out whether there are significant statistical relationships among various human resource indicators and measures of economic development. Quantitative approach in identifying indicators of human resource development obviously presents certain difficulties. But at the same time, even qualitative approach involves difficulties of evaluation. Recently, several attempts have been made to determine qualitative relationships between indicators of educational development and economic growth for a limited number of countries. Here also, one has to distinguish between the human resource indicators which might be desirable and which are available. It is, however, agreed that the most important indicators of human resource development fall into two general categories:

- (i) those which measure a country's stock of human capital; and
- (ii) those which measure the gross or net additions to the stock or more precisely the rate of human capital formation over a specified time period.

While the stock of human capital indicates the level of human resource development which has been achieved by a country, the rate of human capital formation indicates its rate of improvement. In both cases, one is forced to make a distinction between those indicators which would be regarded as desirable if data were available and those which are used because data are available.

For purposes of international comparison, the following indicators of stock of human capital would be useful:

- (i) levels of educational attainment; and
- (ii) the number of persons, expressed as percentage of the population or labour force, who are in high level occupations.

Under category (i) one would like to particularly indicate the first (primary or elementary), second (secondary) and third (higher) levels of educational attainment. The last two are particularly important in indicating the stock of high level manpower, especially the proportions in the second and third levels which have completed scientific and technical courses. Under category (ii) the numbers would relate to the people in selected strategic occupational groups like scientists, engineers, managers, teachers, doctors and dentists, scientific and engineering technicians, nurses and medical assistants and persons in the foreman and skilled worker category.

In addition to data on educational attainment for the latest available census years, it may be useful to treat literacy also as a measure of human capital. In a number of studies, literacy is regarded as an important indicator of human resources development. This indicator is, however, relatively poor because the census data is based on getting answers to questions "can you read or write". The resultant answers may vary widely depending upon the interpretation put on the question, and the reported estimates also vary within ranges.

The second best measures, indicating the growth of human resource development, universally recognized, are as under:

- (i) number of teachers (first and second levels) per 10,000 population;
- (ii) engineers and scientists per 10,000 population;
- (iii) physicians and dentists per 10,000 population;
- (iv) pupils enrolled at first level (primary education) as a percentage of the estimated population in the corresponding age-group;
- (v) the adjusted school enrolment ratios for first and second levels combined;
- (vi) pupils enrolled at second level (secondary education) as a percentage of the estimated population in the corresponding age-group; and
- (vii) enrolment at the third level (higher education) as a percentage of the population in the corresponding age-group.

The first three are partial measures of the stock of human resources and the next four are measures of additions to it. In addition to these, there are two other indicators of human resource development which indicate the orientation of higher education. These are:

- (i) the percentage of students enrolled in scientific and technical faculties in recent years; and
- (ii) the percentage of students enrolled in faculties of humanities, fine arts and law in the same year.

While the task of identifying indicators of human resource development is somewhat easy, the collection of data relevant to the selected indicators, their presentation in a coherent form and an analytic study indicative of the growth or otherwise of human resources development, is undoubtedly challenging and to some extent difficult.

### III. Survey of Human Resource Potential in India

Any survey of human resource potential would be incomplete without a study of the demographic trends, its composition in terms of various age-groups, under-privileged and socially backward classes, distribution by livelihood classes, levels of education, etc. An attempt is made below to present briefly the demographic position in India.

Population in India has been growing at a very fast pace. While in 1901, the population was 238 million, it rose to 319 million in 1941, 361 million in 1951, 439 million in 1961 and to 548 million in 1971.

TABLE I

Growth of Population in India, 1901-1971  
Total Population

| Year | Males       | Females     | All Persons               |
|------|-------------|-------------|---------------------------|
| 1901 | 120,760,506 | 117,330,453 | 238,337,313* <sup>n</sup> |
| 1911 | 128,340,309 | 123,665,161 | 252,005,470               |
| 1921 | 128,504,733 | 122,734,759 | 251,239,492               |
| 1931 | 142,871,864 | 135,734,938 | 278,867,430*              |
| 1941 | 163,622,013 | 154,632,036 | 318,539,060*              |
| 1951 | 185,456,252 | 175,494,113 | 360,950,365               |
| 1961 | 226,208,008 | 212,864,574 | 439,072,582               |
| 1971 | 283,936,614 | 264,013,195 | 547,949,809               |

\*The distribution of population by sex of Pondicherry for 1901 (246,354), 1931 (258,628) and 1941 (285,011) is not available. The figures for these years are, therefore, exclusive of these population so far as distribution by sex is concerned.

<sup>n</sup>In 1901, sex-wise distribution of Chandannagar (26,831) of West Bengal and Gonda (18,810) of Uttar Pradesh is not available.

The proportion of females to males is slowly declining over the years. While the number of females to per 1,000 males was 946 in 1951, it declined to 941 in 1961 and to 932 in 1971.

Bulk of the population, however, has been in rural areas. According to the Census of 1951, the population in rural areas was 295 million *i.e.*, 82.7 per cent of the total population of 357 million and according to the Census of 1961, the rural population was 360 million, 82 per cent of the total population of 439 million. However, according to the Census of 1971, the rural population was 439 million, 80 per cent out of the total population of 548 million.

TABLE II  
Total Population in India 1951, 1961 and 1971  
Urban and Rural Classification

| Category    |       | 1951*           | 1961            | 1971            |
|-------------|-------|-----------------|-----------------|-----------------|
| 1           |       | 2               | 3               | 4               |
|             |       | (000's)         |                 |                 |
| Males       | Urban | 33,273 ( 18.1)  | 42,789 ( 18.9)  | —               |
|             | Rural | 150,061 ( 81.9) | 183,504 ( 81.1) | —               |
|             | Total | 183,334 (100.0) | 226,293 (100.0) | 283,937 (100.0) |
| Females     | Urban | 28,602 ( 16.5)  | 36,148 ( 17.0)  | —               |
|             | Rural | 144,943 ( 83.5) | 176,794 ( 83.0) | —               |
|             | Total | 173,545 (100.0) | 212,942 (100.0) | 264,013 (100.0) |
| All Persons | Urban | 61,875 ( 17.3)  | 78,937 ( 18.0)  | 109,097 ( 19.9) |
|             | Rural | 295,004 ( 82.7) | 360,298 ( 82.0) | 438,853 ( 80.1) |
|             | Total | 356,879 (100.0) | 439,235 (100.0) | 547,950 (100.0) |

\*Excludes figures for Jammu and Kashmir; Goa, Daman and Diu, Pondicherry (Karaikal, Mahe and Yanam); NEFA; major portion of Nagaland and Dadra & Nagar Haveli.

Figures given in brackets indicate percentages.

- While the total increase in population during 1951-61 was 82 million, in rural areas alone the increase was of the order of 65 million. There has, however, been some slight shift in the rural population. While the percentage of population living in rural areas in 1901 was 89, it decreased to 82 in 1961. Urbanization is both a consequence and a causal factor in economic development. The rate of urban growth is an important index of progress of the economy. It was expected that there would be much faster rate of urban growth in the 1951-61 decade. The urban population in 1951 was 17.3 per cent of the total population and it was 18 per cent in 1961. Many reasons have been advanced for the slow rise in the growth of urban population. The Census of 1971 indicates higher trend in urban population.

The percentage distribution of India's population by four different well recognized age-groups *viz.*, 0-4, 5-14, 15-59, and 60 and over, during the period 1911-66 and projected upto 1976, is given in the following Table:

TABLE III

Percentage Distribution of India's Population  
by Age-Groups 1911-76

| Year   | Age-group |       |       |             | Total |
|--------|-----------|-------|-------|-------------|-------|
|        | 0—4       | 5—14  | 15—59 | 60 and over |       |
| 1      | 2         | 3     | 4     | 5           | 6     |
| 1911   | —         | 38.8* | 60.2  | 1.0         | 100.0 |
| 1921   | —         | 39.2* | 59.6  | 1.2         | 100.0 |
| 1931   | —         | 38.3* | 60.2  | 1.5         | 100.0 |
| 1951   | 13.3      | 24.1  | 56.9  | 5.7         | 100.0 |
| 1961   | 16.5      | 24.5  | 53.3  | 5.7         | 100.0 |
| 1966   | 16.3      | 25.3  | 53.4  | 5.0         | 100.0 |
| 1971** | 15.7      | 25.8  | 52.7  | 5.8         | 100.0 |
| 1976** | 14.7      | 25.6  | 54.1  | 5.6         | 100.0 |

\*Relate to age-group 0—14 as break-up between the ages 0—4 and 5—14 is not available.

\*\*Estimates.

Thus over the years, the proportion of age-group 0-14 to the total population has increased and that of the productive population (i.e. age-group 15 to 59 years) has fallen. The preponderance of the younger population increases the dependency load, leads to diversion of resources from capital formation to population maintenance and amounts to a wasteful exploitation of children workers who may be forced into work at under-developed levels of skill and stamina and may cause under-employment.

Two categories of the population belonging to weaker sections are Scheduled Castes and Scheduled Tribes. They together comprise more than one-fifth of the total population. In 1961, the population of Scheduled Castes increased to 64 million or 14.7 per cent of the total population. More than 57 per cent of the Scheduled Caste population (37 million) was concentrated in the States of Uttar Pradesh, West Bengal, Bihar and Tamil Nadu. The population of Scheduled Tribes in 1961 increased to 30 million or 6.8 per cent of the population. More than 50 per cent (17 million) of the Scheduled Tribes population was concentrated in the States of Madhya Pradesh, Orissa and Bihar.

The distribution of population in India, classified as workers and non-workers, according to 1971 Census, is indicated in Table IV.

TABLE IV

## Distribution of Population in India — Workers and Non-Workers

| Category                                                                                 | Number of Persons in Thousands |                    |                    |
|------------------------------------------------------------------------------------------|--------------------------------|--------------------|--------------------|
|                                                                                          | Male                           | Female             | All Persons        |
| <b>Workers</b>                                                                           |                                |                    |                    |
| 1. Cultivators                                                                           | 68,910<br>(24.2)               | 9,266<br>( 3.5)    | 78,176<br>(14.2)   |
| 2. Agricultural labourers                                                                | 31,695<br>(11.2)               | 15,794<br>( 6.0)   | 47,489<br>( 8.6)   |
| 3. Livestock, Forestry, Fishing, Hunting and Plantations, Orchards and Allied Activities | 3,514<br>( 1.2)                | 783<br>( 0.3)      | 4,297<br>( 0.8)    |
| 4. Mining and Quarrying                                                                  | 799<br>( 0.3)                  | 124<br>( 0.0)      | 923<br>( 0.2)      |
| 5. Manufacturing, Processing, Servicing and Repairs                                      |                                |                    |                    |
| (a) Household Industry                                                                   | 5,021<br>( 1.8)                | 1,331<br>( 0.5)    | 6,352<br>( 1.2)    |
| (b) Other than Household Industry                                                        | 9,851<br>( 3.5)                | 865<br>( 0.3)      | 10,716<br>( 2.0)   |
| 6. Construction                                                                          | 2,012<br>( 0.7)                | 204<br>( 0.1)      | 2,216<br>( 0.4)    |
| 7. Trade and Commerce                                                                    | 9,482<br>( 3.3)                | 556<br>( 0.2)      | 10,038<br>( 1.8)   |
| 8. Transport, Storage and Communications                                                 | 4,255<br>( 1.5)                | 146<br>( 0.1)      | 4,401<br>( 0.8)    |
| 9. Other Services                                                                        | 13,536<br>( 4.8)               | 2,229<br>( 0.9)    | 15,765<br>( 2.9)   |
| (A) Total Workers                                                                        | 149,075<br>(52.5)              | 31,298<br>(11.9)   | 180,373<br>(32.9)  |
| (B) Total Non-Workers                                                                    | 134,862<br>(47.5)              | 232,715<br>(88.1)  | 367,577<br>(67.1)  |
| Grand Total                                                                              | 283,937<br>(100.0)             | 264,013<br>(100.0) | 547,950<br>(100.0) |

This means that of the total population, 33 per cent (53 per cent males and 12 per cent females) were working. The Census of 1971 also revealed that participation rate for each sex was distinctly higher in the rural areas.

The percentage distribution of workers by industrial categories,

according to the 1971 Census, indicates that India continues to be a peasant economy, as shown in the Table below:

**TABLE V**  
**Percentage Distribution of Workers by Industrial Categories and Sex**

| <i>Category</i>                                                                          | <i>Total</i> | <i>Percentages</i> |               |
|------------------------------------------------------------------------------------------|--------------|--------------------|---------------|
|                                                                                          |              | <i>Male</i>        | <i>Female</i> |
| 1. Cultivators                                                                           | 43.4         | 46.2               | 29.6          |
| 2. Agricultural labourers                                                                | 26.3         | 21.3               | 50.5          |
| 3. Livestock, Forestry, Fishing, Hunting and Plantations, Orchards and Allied Activities | 2.4          | 2.4                | 2.5           |
| 4. Mining and Quarrying                                                                  | 0.5          | 0.5                | 0.4           |
| 5. Manufacturing, Processing, Servicing and Repairs                                      |              |                    |               |
| (a) Household Industry                                                                   | 3.5          | 3.4                | 4.2           |
| (b) Other than Household Industry                                                        | 6.0          | 6.6                | 2.8           |
| 6. Construction                                                                          | 1.2          | 1.3                | 0.6           |
| 7. Trade and Commerce                                                                    | 5.6          | 6.4                | 1.8           |
| 8. Transport, Storage and Communications                                                 | 2.4          | 2.8                | 0.5           |
| 9. Other Services                                                                        | 8.7          | 9.1                | 7.1           |
| <b>Total:</b>                                                                            | <b>100.0</b> | <b>100.0</b>       | <b>100.0</b>  |

The pattern of occupational structure over the past sixty years is indicated below:

**TABLE VI**  
**Occupational Distribution of Working Force in India**

| <i>Sectors</i> | <i>Y E A R S</i> |              |              |              |              |              |
|----------------|------------------|--------------|--------------|--------------|--------------|--------------|
|                | 1901             | 1911         | 1921         | 1931         | 1951         | 1961         |
| Primary        | 71.5             | 74.9         | 76.5         | 74.7         | 74.4         | 76.4         |
| Secondary      | 11.7             | 10.8         | 9.7          | 10.3         | 10.6         | 11.0         |
| Tertiary       | 16.8             | 14.3         | 13.8         | 15.0         | 15.0         | 12.6         |
| <b>Total</b>   | <b>100.0</b>     | <b>100.0</b> | <b>100.0</b> | <b>100.0</b> | <b>100.0</b> | <b>100.0</b> |

The Table indicates that primary employment has been increasing and the employment in tertiary sectors has been showing a decline. It also seems that the decade of planned development has not made any impact on the employment in the secondary sector. The relative upsurge of the primary sector on the one hand and stagnation and even moderate to considerable shrinkage in the secondary and tertiary sectors on the other have produced a stage when surplus agricultural labour has not been effectively siphoned off from the primary sector.

#### IV. Human Resources Development and the Indian Constitution

The Constitution of India, in its various articles, gives a prominent place to the development of the human factor. The Preamble of the Constitution itself is a recognition of this fact. The articles of the Constitution relating to 'Fundamental Rights' and 'Directive Principles of State Policy' among others, lay down that the State shall not deny to any person equality before the law, nor shall the State discriminate against any citizen on the ground only of religion, race, caste, sex, place of birth or any of them: nothing shall prevent the State from making any special provision for the advancement of women and children and socially and educationally backward classes of citizens or for the Scheduled Castes and Scheduled Tribes. Further, the Constitution also embodies in its fundamental rights that no citizen shall, on grounds only of religion, race, caste, sex, place of birth or any of them, be subject to any disability, liability, restriction or condition in regard to use of any public place, entertainment, etc. It has also laid down that nothing shall prevent the State from making any special provision for men and women. There shall be equality of opportunity for all citizens in matters relating to employment or appointment to any office under the State. Untouchability, which was one of the greatest banes of Indian society and discriminated man against man, was abolished by the Constitution and its practice in any form was forbidden. Freedom of speech and expression to every citizen which is a condition precedent for human resources development, is a fundamental right guaranteed in the Constitution. The Constitution also prohibits traffic in human beings and *begar* (forced labour) and other similar forms of forced labour. No child below the age of 14 years should be employed to work in any factory or mine or engaged in any other hazardous employment. Any section of the citizens residing in any part of India having a distinct language, script or culture of its own, has been given the fundamental right to conserve the same. No citizen shall be denied admission in any educational institution maintained by the State or receiving aid out of State funds on grounds only of religion, race, caste, language or any of them.

Part IV of the Constitution deals with the 'Directive Principles of State Policy' which are fundamental in the governance of the country and it shall be the duty of the State to apply these principles in making laws. Article 39 in the chapter 'Directive Principles of State Policy' has stated that the State shall, in particular, direct its policy, among other things, towards securing that the citizens, men and women, equally have the right to an adequate means of livelihood; there is equal pay for equal work for both men and women; the health and strength of workers, men and women, and the tender age of children are not abused and that

citizens are not forced by economic necessity to enter avocations unsuited to their age or strength, and childhood and youth are protected against exploitation and against moral and material abandonment. Article 41 lays down that the State shall, within the limits of its economic capacity and development, make effective provision for securing the right to work, to education and to public assistance in cases of unemployment, old age, sickness and disablement and any other cases of undeserved want. Provision for just and human conditions of work, living wage, etc., are set out in Articles 42 and 43 of the Constitution. Article 45 stipulates that the State shall endeavour to provide, within a period of ten years from the commencement of the Constitution, for free and compulsory education for all children until they complete the age of fourteen years. Article 46 of the Constitution lays down that the State shall promote with special care the educational and economic interests of the weaker sections of the people, and, in particular, of the Scheduled Castes and the Scheduled Tribes, and shall protect them from social injustice and all forms of exploitation.

Article 41 of the Constitution lays down that the State shall, within the limits of its economic capacity and development, make effective provision for securing the right to education, but the right to education, as such has not been included in the list of fundamental rights under the Constitution, although Articles 29 and 30 grant certain educational rights to the minorities. It seems that the Constitution makers could not make the right to education a fundamental right and the extreme difficulty they contemplated even in implementing Article 41 under the 'Directive Principles of State Policy' is evident in the phrase 'within the limits of its economic capacity and development'. Article 45 of the Constitution is important from the point of view of human resource development which makes provision for free and compulsory education for children until they complete the age of 14 years. Since 1951, all-out efforts are being made to achieve the constitutional directive. The Constitution makers, though not unaware of the financial implications of such a directive, were serious about its implementation especially when Article 45 is read with Article 24 of the Constitution, under the 'Fundamental Rights' which states: "No child below the age of fourteen years shall be employed to work in any factory or mine or engaged in any other hazardous employment". The Constitution makers rightly believed that this is the age when a child should be studying in some school.

#### V. Five Year Plans and Human Resource Development

Soon after the passing of the Constitution in 1950, the Government of India set up the Planning Commission in March 1950, with a view to realizing the basic objectives of the Constitution which were set forth in the 'Directive Principles of State Policy'. Articles 38, 39, 42, 43,

44, 45, 46, 47 and 48 of Part IV of the Constitution dealing with the 'Directive Principles of State Policy' are directly relevant to the development of human resources. Among the Directive Principles, the position of eminence goes to Articles 38 and 39, reproduced below, which set the tone to the basic philosophy and programmes embodied in the Five Year Plans of India:

*Article 38*

"The State shall strive to promote the welfare of the people by securing and protecting as effectively as it may a social order in which justice, social, economic and political, shall inform all the institutions of the national life."

*Article 39*

"The State shall, in particular, direct its policy towards securing —

- (a) that the citizens, men and women equally, have the right to an adequate means of livelihood;
- (b) that the ownership and control of the material resources of the community are so distributed as best to subserve the common good;
- (c) that the operation of the economic system does not result in the concentration of wealth and means of production to the common detriment;
- (d) that there is equal pay for equal work for both men and women;
- (e) that the health and strength of workers, men and women, and the tender age of children are not abused and that citizens are not forced by economic necessity to enter avocations unsuited to their age or strength;
- (f) that childhood and youth are protected against exploitation and against moral and material abandonment."

In the context of planning and with special emphasis on human resource development, it would be useful to draw attention to three other Articles viz., 41, 45 and 46.

The Planning Commission, under its terms of reference as defined in the Government of India Resolution of March 1950, was asked to make an assessment of the material, capital and human resources of the country, including technical personnel and investigate the possibilities of augmenting such of these resources as are found to be deficient in relation to the nation's requirements; and formulate a plan for the most effective and balanced utilization of the country's resources. In chapter I of the First Five Year Plan, while discussing planning and its economic and social aspects, it was observed that the central objective of planning in India at the present stage is to initiate a process of development which will raise living standards and open out to the people new opportunities for a richer and more valid life. The problem of development of an under-

developed economy is one of utilizing more effectively the potential resources available to the community, and it is this which involves economic planning. It was pointed out that the economic condition of a country, at any given time, is a product of the broader social environment and economic planning has to be viewed as an integral part of a wider process aiming not merely at the development of resources in a narrow technical sense but at the development of human faculties and the building up of an institutional frame work adequate to the needs and aspirations of the people. It was further observed that an under-developed economy is characterized by the co-existence, in greater or lesser degree, of unutilized and under-utilized man-power on the one hand and of unexploited natural resources on the other. The elimination of poverty cannot obviously be achieved merely by redistributing existing wealth, nor can a programme aiming only at raising production remove existing inequalities. Referring to the determinants of economic development, the First Plan observed that economic development of an under-developed country cannot proceed far unless the community learns how to get from its resources of men and materials the larger output of commodities and services. The pace of economic development depends on a variety of factors which constitute the psychological and sociological setting within which the economy operates. A major element in the setting is the community's will to progress and its readiness to develop and adopt new and more efficient methods and processes of production. Basically, development involved securing higher productivity all round and this is a function of the degree of technological advance the community is able to make.

Referring to investment, income and economic development in India, the First Plan observed that development effort is something more than investment, defined in the technical sense of additions to capital equipment. When the levels of education and health are as low as they are in India today, measures designed to raise them -- which might require only moderate amounts of capital equipment -- would yield larger returns than many forms of investment in the narrower sense of the term. The potentialities in this direction are immense. The scope for raising agricultural productivity in the country by relatively small outlays of money on agricultural extension service is an instance in point. Technical education and training, together with slight improvements in methods of production, may have similarly the effect of increasing productivity substantially in small-scale industries.

The central object of planning, as defined in the First Plan, is to create conditions in which living standards are reasonably high and all citizens, men and women, have full and equal opportunity for growth and service. It was further observed that we have not only to build up a big production machine -- though this is no doubt a necessary condi-

tion of development—we have at the same time to improve health, sanitation and education and create social conditions for vigorous cultural advances. Planning must mean co-ordinated development in all these fields. Fuller utilization of the idle manpower in the country must be a major objective, and every effort must be made to create opportunities for work in the rural areas through improvements in agriculture, development of cottage and small-scale industries and extensive programmes of public works, especially in the slack season, and by providing necessary equipment and other materials needed for improving labour productivity limits and the rate at which idle manpower can be absorbed. Rigidity of the occupational pattern is incompatible with rapid economic development. The First Plan, therefore, suggested that steps must be taken to ensure the fullest possible utilization, in furtherance of development programmes, of labour power now running to waste, and the long-run objective must be to encourage rather than to discourage the mobility of labour, geographical and occupational.

The First Plan also observed that the problem of unemployment among the educated middle classes in the urban areas is an instance of a failure of co-ordination between the system of education and the needs of the economic system.

The first two Five Year Plans emphasized the importance of developing human resources through various schemes. The 'Directive Principles' of the Constitution were given a more precise direction in December 1954, when Parliament adopted the "Socialist Pattern of Society", as the objectives of social and economic policy. It was made clear that the approach of planned development should be realized under the frame work of democratic socialism. Thus the Second Five Year Plan stated:

"The task before an under developed country is not merely to get better results within the existing framework of economic and social institutions, but to mould and refashion these so that they contribute effectively to the realisation of wider and deeper social values."

These values or basic objectives have been summed up in the phrase: "Socialist Pattern of Society".

Thus the socialist pattern of society envisages maximization of production and reduction of economic and social disparities, and these two may be regarded as the corner-stone of the envisioned new pattern of society.

In a nutshell, it could be stated that the salient features of the socialist pattern of society in terms of a programme of action are as under:

- (i) provision of basic minimum standard of life;
- (ii) reduction of economic disparities;
- (iii) prevention of concentration of economic power;
- (iv) production of social gain and not for mere earning profit; and

- (v) provision of opportunities for the full growth of an individual's personality.

The main emphasis, one could conclude, is on the development of human resources through the attainment of different types of objectives.

In the Third Five Year Plan, while discussing the objectives of planned development, it has been mentioned that the basic objective of India's development must necessarily be to provide the masses of the Indian people the opportunity to lead a good life. That indeed is the objective of all countries for their peoples, even though the good life may be defined in many ways. The Third Plan also mentioned that in a democracy: the pace of change depends to a large extent on increase in public understanding and in public response and on the growth of scientific outlook on the part of large numbers of people. Besides the economic and social objectives, the educational aspects of planning are, therefore, of great emphasis. These are emphasized through the wide sharing of responsibility for drawing up and carrying out plans and through the participation in the process of planning by organizations representing all sections of opinion as well as universities and educational institutions and voluntary social service agencies.

Referring to equal opportunity, the Third Five Year Plan document states that the first condition for securing equality of opportunity and achieving a national minimum is assurance of gainful employment for everyone who seeks work. The economy is able to achieve a rate of growth sufficient to provide work at an adequate level of remuneration to the entire labour force only when the industrial base has been greatly strengthened and education and other social services developed. The Third Plan also concedes that the development of education and other social services in advanced countries, has played a large part in ensuring greater equality of opportunity to different sections of the population and greater social mobility. Similarly, social services have also helped to bring about a measure of redistribution of income and provide the basic necessities and it is expected that in India too, the expansion of social services will exert a similar influence, specially through the extension of free and universal education at the primary level, provision of larger opportunities for vocational and higher education, grant of scholarships and other forms of aid and improvement in the conditions of health, sanitation, water supply and housing. Further, programmes for the welfare of Scheduled Tribes and Castes and other backward classes, for the provision of minimum amenities in the rural areas, for local development at the village level and for the housing of industrial workers and slum clearance and improvement, need to be viewed not merely as extensions of social services but as vital ingredients in the scheme of economic development. More equal opportunities to different sections of the community can be provided by combining social services like the

provision of scholarships and other facilities in the field of training and education with programmes of intensive economic development. Under the subject of economic and social integration, the Third Plan document has mentioned that planning is a continuous process and cannot be isolated for short periods. "Ultimately, it is the development of human being and the human personality that counts. Although planning involves material investment, even more important is the investment in man."

The Fourth Five Year Plan, 1969-74, states the philosophy of planned development of economy in a much clearer tone with emphasis on human resource development in the following terms:

"The objective of national planning in India is not only to raise the per capita income but also to ensure that the benefits are evenly distributed, that disparities in income and living are not widened but in fact narrowed, and that the process of economic development does not lead to social tensions endangering the fabric of the democratic society. In part these can be achieved by seeing that, in the implementation of the programmes, the weakest are looked after first and the benefits of development are made to flow by planned investment in the under-developed regions and among the more backward sections of the community. In part this will be the result of purposeful policy decisions effectively pursued. Fiscal and other policies should prevent concentration of wealth, check ostentatious consumption and promote savings. The programmes and policies of public financial and other institutions should ensure wider dispersal of benefits. Reforms in the educational system should help the growth of initiative and enterprise, make for horizontal and vertical mobility, open up wider opportunities for employment and enable the lowering of caste, class and regional barriers so that a purposeful change towards an egalitarian society can be brought about. In the last analysis, planned economic development should result in a more even distribution of benefits, a fuller life for an increasingly larger number of people, and the building up of a strong integrated democratic nation."

## VI. Education and Training

Prior to independence, education did not receive the attention it deserved. The position did not change very much till the launching of the First Five Year Plan in April 1951. On the eve of the First Plan, the development of human resources was not even thought of.

Illustrative of the fact is that in 1946-47 out of the total population of about 40 million in the age-group 6-11, only 14.11 million i.e. 35% of the children in this age-group attended classes I-V. In classes VI-VIII, the enrolment was about 2 million forming only 9 per cent of the total number of 22 million children in the age-group 11-14. The number of

secondary schools was 5,297 and the enrolment in these schools was 0.87 million or 3.8% of the boys and girls in the age-group 14-17. There were 19 universities, 297 arts and science colleges with an enrolment of 0.21 million students and 140 professional technical colleges with an enrolment of 0.04 million students. Even after a century of State aided effort, only 17% of the people in the country had been made literate. The total expenditure on education in 1947 was 576.6 million or Rs 1.94 per head of population of which the Government's contribution was only Rs 0.69. The picture in the rural areas was worst.

Apart from the inadequacy of facilities, the system of education obtaining before independence had no national direction. First it was, by and large, mechanical emphasising memory work rather than independent thinking or problem solving. The schools were ill-equipped and teachers were poorly paid. The curricula had no relation either to individual or social needs. Wastage and stagnation was rampant. In the arts and science colleges, the methods of teaching were hardly conducive to the development of a critical and cultivated mind which is the hallmark of an educated individual. The facilities for research at the post-graduate level were meagre. Some reform had partly begun at the elementary stage without affecting the other stages with the result that this stage got isolated from the rest of the educational system with obvious hardship to the students and the teachers.

The development of human resources was recognized as one of the basic objectives of the Constitution and also of the economic and social plans initiated in the country since 1951. It was realized that education was the main instrument of change and that the development of human resources through education was more crucial and important than the development of physical resources which could be achieved through modernization of agriculture and rapid industrialization requiring adoption of a science-based technology, heavy capital formation and investment and provision of the essential infra-structure of transport, credit marketing and other institutions. The reason why human resources development is more important is because of the realization of the country's aspirations which involves changes in the knowledge, skills, interests and values of the people as a whole. This is basic to every programme of social and economic betterment. For instance, it has been assumed that there can be no hope of making the country self-sufficient in food unless the farmer himself is moved out of the age-long conservatism through a science-based education, becomes interested in experimentation, and is ready to adopt techniques that increase yields. The same is true of industry. The skilled manpower needed for the relevant research and its systematic application to agriculture, industry and other sectors of life can only come from a development of scientific and technological education. Similarly, economic growth is not merely a matter of

physical resources or of training skilled workers; it means the education of the whole population in new ways of life, thought and work. For a traditional society which has accepted the goal of modernization, high priority has to be given to human change on a grand scale.

The assessment carried out by the Planning Commission on the eve of the First Plan, indicated that considering the size of the population, the overall provision of educational facilities was very inadequate. Similarly, the literacy percentage of the population was 17.2 which was only a very rough measure of the huge task ahead in the field of adult education. Facilities for technical education required to be expanded considerably to meet the needs of the country adequately. The overall structure of the educational system was defective in many ways, one of which was that it was top heavy. Although the provision at the secondary stage was proportionate to that of the primary stage but at the university stage it was larger than the basic structure could profitably support. It was also revealed by the distribution of educational expenditure among the various stages. There were grave disparities between different States in the matter of provision of educational facilities. The expenditure on education compared to total revenues and population also varied in different States. Educational facilities were not properly distributed between urban and rural areas. Whereas about 83 per cent of the population lived in rural areas, the percentage of the total number of pupils in recognized primary, middle and high schools, who were studying in rural areas in 1949-50, was 60, 67 and 26 respectively. At the university stage, facilities were practically non-existent in rural areas. There was lack of balance between provision of facilities for different sections of society. Whereas women constituted nearly half the population, the girl pupils in the primary, middle and high school stages were 28, 18 and 13 per cent respectively of the total number of pupils studying in different stages. Though the various stages of the educational system were not clearly and rationally marked out, the duration and standards of the primary and secondary stages varied considerably in different States. Another disturbing feature of the situation was the large wastage in various forms at different stages of education. Of the total number of students entering schools in 1945-46, only 40 per cent reached Class IV and the expenditure on the remaining 60 per cent was largely wasted. The experiment of compulsion which was then regarded as the only remedy for improving the position had not made much progress. The absence of adequate facilities for technical and vocational education resulted in a much larger number of students going in for general education than was justified by the requirements of the country or the tastes and aptitudes of the people. The position in regard to percentage of untrained teachers was highly unsatisfactory; the percentage of untrained teachers in primary schools

was 41.4 and in secondary schools 46.4. There was dearth of women teachers. The scales of pay and conditions of service of teachers were generally very unsatisfactory and constituted a major cause of the low standards of teaching.

Summing up the position, the Planning Commission in their Report on the First Five Year Plan indicated the following lines of direction:

- (1) Reorientation of the educational system and integration of its different stages and branches;
- (2) expansion in various fields especially in those of basic and social education, remodelling of secondary education and technical and vocational education;
- (3) consolidation of existing secondary and university education and devising a system of higher education suited to the needs of the rural areas;
- (4) expansion of facilities for women's education especially in rural areas;
- (5) training of teachers especially women teachers and teachers of basic schools and improvement in their pay scales and conditions of service; and
- (6) helping backward States by giving preferential treatment to them in the matter of grants.

Since 1951-52 till now, there has been a systematic effort to reorganize the system of education and enrich its content so as to meet the needs of trained manpower, particularly in the context of the developing economy. The University Education Commission (1948), Secondary Education Commission (1952-53) and the Education Commission (1964-66) provided the guidelines for future development in different sectors of education. The Central Advisory Board of Education, the All India Council for Technical Education and other consultative bodies, which were set up from time to time, helped in the formulation of policies in the reconstruction of the educational system in the country. Mention may also be made of the setting up, during this period, of the University Grants Commission with the object of raising standards of teaching and research in the universities, of the establishment of the Institutes of Technology for teaching and research facilities of a high standard, of the establishment of the National Council of Educational Research and Training to undertake programmes of training and research in teacher education including in-service education, examination reforms, improvement of curricula, text books, educational and vocational guidance etc., and the setting up of a National Staff College for educational administrators and planners to organize short-term orientation and training programmes for educational administrators to carry out researches and studies in the field of educational administration and planning.

Ever since the initiation of the First Plan, there has been an increas-

ing emphasis on allocation of resources for educational development. The national income, the expenditure on education and the per capita expenditure and its growth during the first 20 years of planning is reflected in the following Table:

TABLE VII  
National Income and Expenditure on Education

| S. No. | Year    | National Income<br>(Current Prices)<br>(in crores) | Total Expenditure<br>on Education<br>(All sources)<br>(in crores) | Per Capita Income<br>(in Rs.) | Per Capita Expenditure<br>on Education<br>(in Rs.) | Total Expenditure on Edn.<br>as %age of National Income |
|--------|---------|----------------------------------------------------|-------------------------------------------------------------------|-------------------------------|----------------------------------------------------|---------------------------------------------------------|
| 1      | 2       | 3                                                  | 4                                                                 | 5                             | 6                                                  | 7                                                       |
| 1.     | 1950—51 | 9,530                                              | 114                                                               | 266.5                         | 3.2                                                | 1.2                                                     |
| 2.     | 1955—56 | 9,980                                              | 190                                                               | 255.0                         | 4.8                                                | 1.9                                                     |
| 3.     | 1960—61 | 14,140                                             | 344                                                               | 306.3                         | 7.8                                                | 2.4                                                     |
| 4.     | 1965—66 | 19,990                                             | 600                                                               | 426.1                         | 12.1                                               | 3.0                                                     |
| 5.     | 1970—71 | 31,569                                             | 1,000                                                             | 577.0                         | 18.2                                               | 3.1                                                     |

The progress in terms of establishment of institutions and enrolment has been phenomenal as will be evident from the figures given in the Table below:

TABLE VIII  
Progress of Education in India

| S. No. | Year    | Total Number<br>of Institutions | Total Enrolment<br>(in thousands) | Total Number of<br>Teachers<br>(in thousands) |
|--------|---------|---------------------------------|-----------------------------------|-----------------------------------------------|
| 1      | 2       | 3                               | 4                                 | 5                                             |
| 1.     | 1946—47 | 157,192                         | 13,573                            | 704                                           |
| 2.     | 1950—51 | 286,860                         | 25,542                            | 818                                           |
| 3.     | 1955—56 | 366,641                         | 33,923                            | 1,116                                         |
| 4.     | 1960—61 | 472,655                         | 47,964                            | 1,508                                         |
| 5.     | 1965—66 | 727,262                         | 70,555                            | 2,135                                         |

The increase in the establishment of institutions, in the enrolment of students and appointment of teachers in the institutions during the last twenty years has been unprecedented and is unparalleled in the history of either developed or developing countries of the world.

Since one of the major programmes, accepted in the national reconstruction and development plans, has been the development of our human resources this implies that there can be no limit to the education to be provided. During the past two and a half decades, priority has been given, within the constraint of resources, to programmes aimed at raising the educational level of the average citizen. Such programmes are essential on grounds of social justice, for making democracy viable

and for improving the productivity of the average worker in agriculture and industry. One of the important objectives of human resource development is to equalize educational opportunities, enabling the backward or under-privileged classes and individuals to use education as a lever for the improvement of their condition. This is presumed to be one of the conditions for building up of an egalitarian and human society in which the exploitation of the weak will be minimized. The progress of enrolment at various stages of education, during the last 20 years and what is expected to be achieved by the end of the Fourth Plan is given in the following Table:

TABLE IX  
Growth in Enrolments

| Year     | Classes I-V             |                                                         | Classes VI-VIII         |                                                         | Classes IX-XI           |                                                         | University Stage        |                                 |

| 1        | 2                       | 3                                                       | 4                       | 5                                                       | 6                       | 7                                                       | 8                       | 9                               |
| 1950-51  | 192.0                   | 42.6                                                    | 31.0                    | 12.7                                                    | 12.0                    | 5.3                                                     | 3.26                    | 0.8                             |
| 1955-56  | 252.0                   | 52.8                                                    | 43.0                    | 16.5                                                    | 19.0                    | 7.4                                                     | 5.75                    | 1.3                             |
| 1960-61  | 350.0                   | 62.4                                                    | 67.0                    | 22.5                                                    | 29.0                    | 10.6                                                    | 8.08                    | 1.7                             |
| 1965-66  | 505.0                   | 76.7                                                    | 103.0                   | 30.8                                                    | 50.0                    | 16.2                                                    | 13.31                   | 2.4                             |
| *1970-71 | 592.5                   | 80.3                                                    | 133.9                   | 34.1                                                    | 71.6                    | 20.4                                                    | 21.49                   | 3.7                             |

\*Figures are provisional

In terms of sheer numbers, the progress has been very remarkable.

For practical and administrative reasons, the programme of education for the age-group 6-14, visualized in the Constitution has been divided into two stages 6-11 and 11-14. If the entire age-group 6-14 is considered together, the position would be as shown in the following Table:

TABLE X  
Provision of Schooling Facilities in the Age-group 6-14

| Year     | Enrolment in Classes I-VIII<br>(lakhs) |       |       | Percentage of Population in<br>the age-group 6-14 |       |       |

\*Figures are provisional

During the years 1951-71, the number of children (age-group 6-14) at school has gone up from 22.3 million to 72.6 million, the proportion of the total population in the age-group rising from 32 to 64 per cent.

Development of the economy and the large increase in the number of secondary schools and in the number of students of the age-group 14-17 enrolled in them altered the character of the demands which secondary education is called upon to meet. New social groups are seeking education and are coming within its influence. Expansion brought into secondary schools a large range of abilities and attitudes. The developments which have taken place in the field of expansion of enrolment during 1951-71 given in the Table below:

TABLE XI  
Provision of Schooling Facilities in the Age-group 14-17

| Year     | Enrolment in Classes IX-X-XI<br>(Figures in lakhs) |       |       | Percentage of enrolment to<br>the age-group 14-17 |       |       |
|----------|----------------------------------------------------|-------|-------|---------------------------------------------------|-------|-------|
|          | Boys                                               | Girls | Total | Boys                                              | Girls | Total |
| 1        | 2                                                  | 3     | 4     | 5                                                 | 6     | 7     |

| 1955-56  | 15.8                                               | 3.0   | 18.8  | 12.8                                              | 2.6   | 7.8   |
| 1960-61  | 23.9                                               | 5.2   | 29.1  | 18.4                                              | 4.2   | 11.5  |
| 1965-66  | 35.7                                               | 9.9   | 45.6  | 23.7                                              | 6.9   | 15.6  |
| *1970-71 | —                                                  | —     | 71.7  | —                                                 | —     | 20.4  |

\* Figures are provisional

While the enrolment has increased from 12.2 lakhs in 1950-51 to about 72 lakhs in 1970-71, the percentage of children in the age-group 14-17 attending schools has grown from 5.3 to 20.4 during the same period.

The number of vocational and technical institutions at the secondary level of education has been increasing and also the enrolment in such institutions. This is shown in the Table below:

TABLE XII  
Growth of Vocational Secondary Education

| Year    | Number of Institutions | Enrolment |
|---------|------------------------|-----------|
| 1949-50 | 2,028                  | 162,532   |
| 1950-51 | 2,339                  | 190,568   |
| 1960-61 | 4,145                  | 424,927   |

The bulk of students in vocational courses are in Teacher Training Schools. Their number in 1960-61 was 123,612. The rest is distributed in commerce, agriculture, engineering, forestry, medicine, industrial arts and crafts and veterinary science courses.

Literacy is an important indicator of stock of human capital. The distribution of the total population in India between literates and

illiterates and among males and females, according to the 1951 and 1971 Census, is shown in the Table below:

TABLE XIII  
Literacy\* in India — 1951 and 1971

|            | 1951 (000's)**    |                   |                   | 1971 (000's)      |                   |                   |
|------------|-------------------|-------------------|-------------------|-------------------|-------------------|-------------------|
|            | Males             | Females           | All Persons       | Males             | Females           | All Persons       |
| 1          | 2                 | 3                 | 4                 | 5                 | 6                 | 7                 |
| Literate   | 45,610<br>(24.9)  | 13,651<br>(7.9)   | 59,261<br>(16.6)  | 111,778<br>(39.5) | 48,731<br>(18.5)  | 160,509<br>(29.4) |
| Illiterate | 137,723<br>(75.1) | 159,895<br>(92.1) | 297,618<br>(83.4) | 171,278<br>(60.5) | 215,169<br>(81.5) | 386,447<br>(70.6) |
| Total      | 185,528           | 175,566           | 361,089           | 283,056           | 263,900           | 546,956           |

1. Excludes Jammu and Kashmir, Goa, Daman and Diu, Pondicherry, (Karaikal, Mahe and Yaman), NEFA, Major portion of Nagaland and Dadra and Nagar Haveli.

2. Figures within parenthesis indicate percentages.

\*The test for literacy, according to Census definition, was satisfied "if a person could, with understanding, both read and write. The test for reading was ability to read any simple letter either in print or in manuscript. If the person could read one of the examples in the enumerators' handbook with facility, he was taken to have passed the test for reading. The test for writing was ability to write a simple letter. To qualify for literacy, a person was not required to pass any standard examination. On the other hand, literacy was recognised as something a man still possessed and actively put to use and it was in this general practical sense that it was uniformly applied. The results are thus comparable from area to area. If a person could both read and write and had also passed a written examination or examinations as proof of an educational standard attained, the highest examination passed was to be recorded." Census of India, 1961, Vol. I, page XIV.

\*\*The total population figures are in absolute number, whereas the figures for literate and illiterate are estimates on the basis the figures obtained in the Census Reports, which were based on a 10% sample of the total population. In the 1971 Census, detailed literacy census was conducted on 10% sample.

Over a period of twenty years, while the number of literates increased from 59 million to 161 million, the percentage to total population improved from about 17 to 29. At the same time, the number of illiterates also increased from 298 million to 386 million. In 1971, while the overall national average of literacy percentage was 29, it was only about 19 in the case of women. The number of illiterates, during 1951-71, increased by 88 million and of these 55 million were women. The increase in total population, during this period, was 186 million. Thus in a way, the unprecedented increase in population during the two decades, among others, has been responsible for the slow rate of growth of literacy.

The distribution of literate population in rural and urban areas, among males and females, according to the 1951 and 1971 Census, is shown in the Table below:

TABLE XIV  
Literate Population — Urban and Rural — 1951 and 1971  
(Figures in millions)

| 1            | Literate Population |         |             | Literate as % of total Population |         |             |
|--------------|---------------------|---------|-------------|-----------------------------------|---------|-------------|
|              | Males               | Females | All Persons | Males                             | Females | All Persons |
| 1            | 2                   | 3       | 4           | 5                                 | 6       | 7           |
| <b>1951*</b> |                     |         |             |                                   |         |             |
| Total        | 45.610              | 13.651  | 59.261      | 24.9                              | 7.9     | 16.6        |
| Rural        | 30.450              | 7.291   | 37.741      | 19.0                              | 4.9     | 11.8        |
| Urban        | 15.160              | 6.360   | 21.520      | 45.0                              | 22.3    | 34.6        |
| <b>1971</b>  |                     |         |             |                                   |         |             |
| Total        | 111.911             | 48.700  | 160.611     | 39.51                             | 18.44   | 29.34       |
| Rural        | 75.889              | 27.631  | 103.520     | 33.77                             | 12.92   | 23.60       |
| Urban        | 36.021              | 21.068  | 57.089      | 61.55                             | 41.91   | 52.48       |

\*The total population figures are in absolute numbers, whereas the figures for the rural and urban areas are estimates on the basis the figures obtained in the Census Report, which were based on a 10% sample of the total population. In 1971 Census, detailed literacy census was conducted on 10% sample basis.

The percentage of literates in rural areas has nearly doubled during the two decades.

The analysis of the 1971 Census data reveals that higher the age-group, larger is the extent of illiteracy. This is clear from the following Table:

TABLE XV  
Literacy by Age-group — 1971 (Census)  
(Figures in millions)

| Age group      | Total Population | Total No. of Literates | Percentage to total Population |
|----------------|------------------|------------------------|--------------------------------|
| 0—4            | 78.3             | 18.7                   | 23.9                           |
| 5—9            | 82.1             | 33.6                   | 40.9                           |
| 10—14          | 67.6             | 24.1                   | 35.7                           |
| 15—19          | 47.5             | 18.9                   | 39.8                           |
| 20—24          | 43.1             | 26.0                   | 60.3                           |
| 25—34          | 76.6             | 12.4                   | 16.2                           |
| 35—            | 149.3            | 24.2                   | 16.2                           |
| Age not stated | 0.9              | 0.2                    | 22.2                           |
| All ages       | 545.5            | 158.1                  | 29.0                           |

Note: Estimates from 1% sample.

The percentage of illiterates is higher in the age-group above 15-19. The population in the age-group 15-34, which roughly represents the youth was about 167 million or 36 per cent of the total population and amongst them only 57 million or about 34 per cent were literate.

For a study of the qualitative growth of education, it would be useful to analyse the composition of population by levels of education. This is shown in the Table XVI. (p. 149)

The increase in literate population between 1951-1971 was 98.8 million and the number of literates who were matriculates and above increased by 17.5 million. Further, within the literate group while the proportion of literates below matriculation was less in 1951 when compared to 1971, their number has increased by 73.1 million. A redeeming feature is that the percentage of persons without educational level of literate population has come down from 85 in 1951 to 37 in 1971.

An adequate supply of skilled manpower is a condition precedent for the success of industrialization. The development of technical education has been one of the major achievements of the post-independence period. The creation of the All India Council for Technical Education in 1944 and the Report of the Scientific Manpower Committee in 1947 had a far-reaching influence on this development. A further impetus was given by the Engineering Personnel Committee (1956) and the Committee for Post-Graduate Engineering Education and Research. The development of technical education, as it relates to industry, was promoted through the Apprenticeship Act (1961), setting up of Industrial Training Institutes (I.T.Is) and Junior Technical Schools, at the skilled worker level, and the expansion of Polytechnics at the technician level. This system has provided the necessary basis to devise further programme of technical education and vocational training. The progress of technical education in terms of number of institutions at the degree and diploma level courses and the intake and out-turn since 1950-51 is indicated in the Table below:

TABLE XVII  
Progress of Technical Education in India 1950-51 to 1970-1971

| Year    | Degree Courses              |            |        |              | Diploma Courses             |            |        |              |
|---------|-----------------------------|------------|--------|--------------|-----------------------------|------------|--------|--------------|
|         | No. of<br>Institu-<br>tions | Intake     |        | Out-<br>turn | No. of<br>Institu-<br>tions | Intake     |        | Out-<br>turn |
|         |                             | Sanctioned | Actual |              |                             | Sanctioned | Actual |              |
| 1       | 2                           | 3          | 4      | 5            | 6                           | 7          | 8      | 9            |
| 1950-51 | 49                          | 4,119      | 4,119  | 2,198        | 86                          | 5,903      | 5,903  | 2,478        |
| 1955-56 | 65                          | 5,888      | 5,888  | 4,035        | 114                         | 10,484     | 10,484 | 4,499        |
| 1960-61 | 102                         | 13,824     | 13,692 | 5,703        | 195                         | 25,801     | 23,736 | 7,969        |
| 1965-66 | 133                         | 24,695     | 23,315 | 10,282       | 274                         | 48,084     | 48,984 | 17,699       |
| 1970-71 | 138                         | 21,108     | —      | 17,768       | 283                         | 42,823     | —      | 22,276       |

During the last twenty years, the expansion of Technical Education has been phenomenal. Due to a variety of reasons, the sanctioned intake in 1970-71 was, however, reduced both in degree and diploma courses.

TABLE XVI  
Distribution of Population by levels of Education 1951, 1961 and 1971

| Level of Education                    | 1951               |                    |                    | 1961               |                    |                    | 1971               |                    |                    |
|---------------------------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|--------------------|
|                                       | Males              | Females            | All persons        | Males              | Females            | All persons        | Males              | Females            | All persons        |
| Literates (without educational level) | 38,125<br>(83.5)   | 12,094<br>(88.6)   | 50,219<br>(84.7)   | 48,287<br>(62.0)   | 18,146<br>(65.8)   | 66,433<br>(63.0)   | 38,920<br>(35.4)   | 19,445<br>(40.3)   | 58,365<br>(36.9)   |
| Below Matric                          | 4,220<br>(9.3)     | 1,022<br>(7.5)     | 5,242<br>(8.8)     | 22,700<br>(29.1)   | 8,158<br>(29.6)    | 30,858<br>(29.2)   | 54,199<br>(49.3)   | 24,204<br>(50.2)   | 78,403<br>(49.6)   |
| Matriculates and above                | 3,265<br>(7.2)     | 535<br>(3.9)       | 3,800<br>(6.4)     | 6,954<br>(8.9)     | 1,275<br>(4.6)     | 8,229<br>(7.8)     | 16,738<br>(15.3)   | 4,577<br>(9.5)     | 21,315<br>(13.5)   |
| Total Literates                       | 45,610             | 13,651             | 59,261             | 77,941             | 27,579             | 1,05,520           | 1,09,857           | 48,226             | 158,083            |
| Total Population                      | 183,334<br>(100.0) | 173,545<br>(100.0) | 356,879<br>(100.0) | 226,146<br>(100.0) | 212,791<br>(100.0) | 438,937<br>(100.0) | 282,421<br>(100.0) | 263,073<br>(100.0) | 545,496<br>(100.0) |

Figures within brackets indicate percentages.

The estimated stock of engineering personnel by branches of engineering since 1955 is given in the following Table:

**TABLE XVIII**  
**Estimated Stock of Engineers by Branches of Engineering 1955 to 1970**  
(Figures in hundreds)

| <i>Speciality</i>  | <i>Stock of Engineering Personnel at the end of</i> |       |       |       |       |
|--------------------|-----------------------------------------------------|-------|-------|-------|-------|
|                    | 1955                                                | 1960  | 1965  | 1968  | 1970  |
| <b>Degree</b>      |                                                     |       |       |       |       |
| Civil              | 109                                                 | 195   | 298   | 393   | 552   |
| Mechanical         | 72                                                  | 125   | 234   | 346   | 575   |
| Electrical         | 62                                                  | 102   | 183   | 279   | 489   |
| Tele-communication | 5                                                   | 9     | 19    | 29    | 50    |
| Metal              | 11                                                  | 19    | 28    | 40    | 68    |
| Mining             | 5                                                   | 9     | 19    | 25    | 33    |
| Chemical           | 27                                                  | 40    | 56    | 77    | 129   |
| Others             | 55                                                  | 81    | 118   | 147   | 194   |
| Total              | 346                                                 | 580   | 955   | 1,336 | 2,090 |
| <b>Diploma</b>     |                                                     |       |       |       |       |
| Civil              | 211                                                 | 371   | 594   | 775   | 944   |
| Mechanical         | 85                                                  | 141   | 322   | 568   | 878   |
| Electrical         | 79                                                  | 125   | 265   | 431   | 625   |
| Tele-communication | 3                                                   | 6     | 11    | 16    | 24    |
| Metal              | 3                                                   | 4     | 4     | 6     | 12    |
| Mining             | 6                                                   | 10    | 21    | 26    | 28    |
| Chemical           | 4                                                   | 4     | 4     | 4     | 9     |
| Others             | 55                                                  | 90    | 117   | 158   | 241   |
| Total              | 446                                                 | 751   | 1,338 | 1,984 | 2,761 |
| <b>Total</b>       |                                                     |       |       |       |       |
| Civil              | 320                                                 | 566   | 892   | 1,168 | 1,496 |
| Mechanical         | 157                                                 | 266   | 556   | 914   | 1,453 |
| Electrical         | 141                                                 | 227   | 448   | 710   | 1,114 |
| Tele-communication | 8                                                   | 44    | 30    | 45    | 74    |
| Metal              | 14                                                  | 15    | 32    | 46    | 80    |
| Mining             | 11                                                  | 19    | 40    | 51    | 61    |
| Chemical           | 31                                                  | 23    | 60    | 81    | 138   |
| Others             | 110                                                 | 171   | 235   | 305   | 435   |
| Total              | 792                                                 | 1,331 | 2,293 | 3,320 | 4,851 |

This Table indicates that the stock of engineers increased from 79,200 at the end of 1955 to 485,100 at the end of 1970. It is expected to be 584,300 at the end of 1978.

Another area in which there has been very good progress is that of the training of craftsmen which prepares skilled workers for the middle level of jobs. The Table below indicates the number of Industrial Training Institutes (I.T.I.) set up in the country since 1955-56, the number of seats provided in these institutions and the out-turn.

TABLE XIX  
Progress of Craftsmen Training

|                                    | 1955-56 | 1960-61 | 1965-66 | 1968-69 |
|------------------------------------|---------|---------|---------|---------|
| <b>1. Craftsmen Training</b>       |         |         |         |         |
| (i) No. of I.T.I.'s                | 59      | 163     | 357     | 356     |
| (ii) No. of seats introduced       |         |         |         |         |
| (a) Engg. Trades                   | 8,622   | 39,797  | 108,196 | 139,644 |
| (b) Non-Engg. Trades               | 1,912   | 2,885   | 5,426   | 7,144   |
| Total                              | 10,534  | 42,685  | 113,622 | 146,788 |
| (iii) Out-turn (cumulative)        |         |         |         |         |
| (a) Engg. Trades                   | 27,175  | 75,031  | 246,000 | 399,893 |
| (b) Non-Engg. Trades               | 10,917  | 20,161  | 32,480  | 42,827  |
| <b>2. Part-time Classes Scheme</b> |         |         |         |         |
| (i) No. of Centres                 | —       | 15      | 34      | 35      |
| (ii) Total seats introduced        | —       | 1,537   | 4,280   | 4,837   |
| <b>3. Craftsmen Instructors</b>    |         |         |         |         |
| (i) No. of Centres                 | 1       | 3       | 7       | 7       |
| (ii) Seating Capacity              | 140     | 686     | 2,380   | 2,428   |
| (iii) Out-turn                     |         |         |         |         |
| (a) Engg. Trades                   | 1,126   | 3,071   | 9,556   | 13,664  |
| (b) Non-Engg. Trades               | 349     | 993     | 1,667   | 2,045   |
| Total                              | 1,475   | 4,046   | 11,223  | 15,709  |

The number of institutions increased from 59 in 1955-56 to 356 in 1969 and the total number of seats, both in engineering and non-engineering trades, during this period, increased from 10,534 to 146,788.

In addition to the Industrial Training Institutes, facilities are provided to workers in part-time classes. There were 35 such centres in 1969 and the total number of seats provided in these part-time courses were 4,837. In view of the large scale expansion of the scheme of craftsmen training, there was some development in the training of craftsmen instructors. The number of their training centres was 7 at the end of 1969 and the out-turn from these centres in the same year was 15,709.

One good measure indicating the growth of human resource development which is universally recognized is the number of teachers of primary,

middle and secondary schools and universities and colleges. The growth in number of teachers during 1950-51 and 1970-71 is given in the Table below:

TABLE XX  
Growth in the Number of Teachers

| Year     | Primary Schools | Middle Schools | High/Higher Secondary Schools | Universities and Colleges |
|----------|-----------------|----------------|-------------------------------|---------------------------|
| 1950—51  | 537,918         | 85,496         | 126,504                       | 21,065                    |
| 1955—56  | 691,249         | 148,394        | 189,794                       | 37,865                    |
| 1960—61  | 741,515         | 345,228        | 296,305                       | 62,229                    |
| 1965—66  | 944,377         | 527,754        | 479,060                       | 128,364                   |
| 1970—71* | 1111,819        | 626,495        | 587,433                       | N.A.                      |

\*Provisional

This indicates that there has been tremendous addition to the stock of teachers during the 20 years and this trend is continuing.

The out-put of persons, passing B.A., B.Sc., M.A., M.Sc., Ph.D. and professional courses has also been increasing. This is shown in Table XXI. (p. 153)

The category-wise stock of scientists, at the end of years 1955, 1960, 1965 and 1970, is indicated in the Table below:

TABLE XXII  
Growth Among Scientists

| Category             | At the end of the year |         |         |         |
|----------------------|------------------------|---------|---------|---------|
|                      | 1955                   | 1960    | 1965    | 1970    |
| 1. Graduates In      |                        |         |         |         |
| General Science      | 102,900                | 165,600 | 261,500 | 420,000 |
| Agricultural Science | 10,100                 | 15,700  | 30,600  | 47,200* |
| Veterinary Science   | 1,400                  | 4,500   | 8,800   | 13,000  |
| 2. Post-Graduates In |                        |         |         |         |
| Mathematics          | 6,500                  | 10,700  | 17,800  | 28,200  |
| Statistics           | 600                    | 1,500   | 3,400   | 5,200   |
| Physics              | 4,800                  | 7,500   | 12,800  | 20,800  |
| Chemistry            | 7,000                  | 10,000  | 18,000  | 29,100  |
| Geo-Sciences         | 1,000                  | 2,000   | 4,200   | 6,600   |
| Zoology              | 2,100                  | 3,500   | 6,500   | 11,100  |
| Botany               | 2,100                  | 3,700   | 6,600   | 11,400  |
| Agriculture          | 2,000                  | 3,700   | 7,700   | 13,500* |
| Other Sciences       | 200                    | 400     | 600     | 1,300   |
| Total                | 140,700                | 227,800 | 378,500 | 607,400 |

\*The Department of Agriculture have estimated the stock of graduates to be 41,000 and post-graduates to be 10,000 in 1968 in their report "Technical Manpower for Indian Agriculture", 1969.

The total stock of scientists has increased from 1,40,700 in 1955 to 6,07,000 in 1970.

TABLE XXI  
Out-turn — General and Professional Education

| Year    | B.A./Bac.<br>(Pass and Hons.) |        |         | M.A./M.Sc. |       |        | Doctorate (including Professional<br>and other subjects) |       |       | Professional Degree and<br>equivalent Diploma only |        |        |
|---------|-------------------------------|--------|---------|------------|-------|--------|----------------------------------------------------------|-------|-------|----------------------------------------------------|--------|--------|
|         | Boys                          | Girls  | Total   | Boys       | Girls | Total  | Boys                                                     | Girls | Total | Boys                                               | Girls  | Total  |
| 1950—51 | 27,357                        | 4,881  | 32,238  | 6,262      | 876   | 7,138  | 136                                                      | 10    | 146   | 17,892                                             | 1,553  | 19,445 |
| 1955—56 | 44,041                        | 9,948  | 53,989  | 9,603      | 2,166 | 11,769 | 321                                                      | 29    | 350   | 31,951                                             | 3,821  | 35,772 |
| 1960—61 | 70,657                        | 22,295 | 92,952  | 18,570     | 5,115 | 23,685 | 959                                                      | 283   | 1,242 | 53,045                                             | 7,179  | 60,224 |
| 1965—66 | 89,865                        | 38,589 | 128,454 | 25,959     | 9,628 | 35,587 | 808                                                      | 99    | 907   | 67,546                                             | 10,721 | 78,267 |

The out-turn has been increasing in all the types of courses.

There has been increasing emphasis on the development of science education in the country. This is indicated by the fact that steadily the enrolment in science classes at the university stage, including U.P. Intermediate Board, has been steadily increasing. This is shown in the following Table:

TABLE XXIII  
Growth of Science at the University Stage

| <i>Year</i> | <i>Enrolment in<br/>Science Courses</i> | <i>Total<br/>Enrolment</i> | <i>Percentage</i> |
|-------------|-----------------------------------------|----------------------------|-------------------|
| 1961—62     | 336,722                                 | 1,155,380                  | 29.1              |
| 1962—63     | 390,174                                 | 1,272,666                  | 30.6              |
| 1963—64     | 435,925                                 | 1,384,697                  | 31.5              |
| 1964—65     | 478,702                                 | 1,528,227                  | 31.3              |
| 1965—66     | 565,254                                 | 1,728,773                  | 32.7              |
| 1966—67     | 654,899                                 | 1,949,012                  | 33.6              |
| 1967—68     | 737,858                                 | 2,218,972                  | 33.3              |
| 1968—69     | 802,369                                 | 2,473,264                  | 32.4              |

The out-turn of scientists at different levels during the period 1951 to 1965 is shown in the following Table:

TABLE XXIV

| <i>Year</i> | <i>B.Sc.</i> | <i>M.Sc.</i> | <i>Ph.D.</i> | <i>Total</i> |
|-------------|--------------|--------------|--------------|--------------|
| 1951        | 26,157       | 4,726        | 376          | 31,259       |
| 1965        | 38,234       | 7,290        | 519          | 46,043       |

The Table below indicates the scientific and technical personnel according to 1961 Census.

TABLE XXV  
Scientific and Technical Personnel

| <i>Category</i>                                      | 1961           |              |                |
|------------------------------------------------------|----------------|--------------|----------------|
|                                                      | <i>Persons</i> | <i>Males</i> | <i>Females</i> |
| 1. Engineering and Technical Personnel               | 132,932        | 132,327      | 605            |
| 2. Scientific Personnel                              | 42,207         | 37,921       | 4,286          |
| 3. Health                                            | 333,278        | 260,664      | 72,614         |
| 4. Agricultural & Allied Personnel                   | 34,529         | 32,450       | 2,079          |
| 5. Teaching Personnel                                | 1,581,704      | 1,264,697    | 3,17,007       |
| 6. Managers and Administrators and Social Scientists |                |              |                |
| (a) Managers                                         | 779,824        | 748,005      | 31,819         |
| (b) Administrators                                   | 714,247        | 705,030      | 9,217          |
| (c) Social Scientists                                | 96,270         | 88,060       | 8,210          |
| Total                                                | 3,714,991      | 3,269,154    | 445,837        |

Note: Excludes personnel from among a population of 297,853 persons (males 1,47,000, females 1,50,753) of NEFA for whom an abridged family schedule was canvassed of General All India Individual Slip and Household Schedule.

The education of girls and women in our country has acquired a new importance after the attainment of independence. The percentage of women to the total population is about 48 (264 million out of 548 million). In 1950-51, the proportion of boys and girls at the school stage was 80 and 20 respectively and this was 69 and 31 in 1970-71. Although women's education has made some advance, the present position at various stages is still far from satisfactory as will be clear from the Table below:

TABLE XXVI  
Proportion of Boys and Girls at Various Stages

| Year    | Classes I-V |       | Classes VI-VIII |       | Classes IX-XI |       | University Stage |       |
|---------|-------------|-------|-----------------|-------|---------------|-------|------------------|-------|
|         | Boys        | Girls | Boys            | Girls | Boys          | Girls | Boys             | Girls |
| 1950-51 | 71.8        | 28.2  | 81.9            | 18.1  | 86.1          | 13.9  | 88.9             | 11.1  |
| 1955-56 | 69.5        | 30.5  | 79.4            | 20.6  | 82.7          | 17.3  | 86.8             | 13.2  |
| 1960-61 | 67.5        | 32.5  | 74.0            | 26.0  | 81.2          | 19.8  | 83.1             | 16.9  |
| 1965-66 | 63.8        | 36.2  | 73.0            | 27.0  | 76.8          | 23.2  | 79.0             | 21.0  |
| 1970-71 | 62.3        | 37.7  | 70.3            | 29.7  | 74.0          | 26.0  | 76.0*            | 24.0* |

\*Figures are provisional.

The position, however, varies from State to State.

The total strength of the trained teachers and their percentage is given in the Table below:

TABLE XXVII  
Trained Teachers and their Percentage  
(In lakhs)

| Year    | Teachers | Trained Teachers | Untrained Teachers | %age Trained |
|---------|----------|------------------|--------------------|--------------|
| 1950-51 | 7.50     | 4.30             | 3.20               | 57           |
| 1955-56 | 10.29    | 6.25             | 4.04               | 60           |
| 1960-61 | 13.78    | 8.92             | 4.86               | 64           |
| 1965-66 | 20.00    | 14.00            | 6.00               | 72           |
| 1970-71 | 22.99    | 17.24            | 5.75               | 75           |

The percentage of trained teachers increased from 57 in 1950-51 to 75 in 1970-71. The growth in the number of training schools and colleges is shown in the Table below:

TABLE XXVIII  
Number of Teachers' Training Institutions

| Year     | Teachers' Training Schools | Teachers' Training Colleges |
|----------|----------------------------|-----------------------------|
| 1950-51  | 782                        | 53                          |
| 1955-56  | 930                        | 107                         |
| 1960-61  | 1,138                      | 478                         |
| 1965-66  | 601                        | 1,272                       |
| 1971-72* | 357                        | 1139                        |

\*Figures are provisional

A good system of scholarships serves two purposes: it supports excellence and it equalizes opportunities. For a large majority of our children, the kind and amount of education which they get depend not on their own abilities but on the economic status of their family. Realizing the need for a large scholarship programme, the Central and State Governments have been providing outlays for scholarships programmes. An idea of the rise in total expenditure on education and scholarships from all sources and the expenditure, which is incurred by the Government on scholarships, stipends and other concessions can be had from the Table below:

TABLE XXIX  
Expenditure on Education and Scholarships (Rs. in crores)

| Year     | Expenditure from all sources on |              | Expenditure from Govt. sources on |              | 3 as %age of 2 | 5 as %age of 4 |
|----------|---------------------------------|--------------|-----------------------------------|--------------|----------------|----------------|
|          | Education                       | Scholarships | Education                         | Scholarships |                |                |
| 1        | 2                               | 3            | 4                                 | 5            | 6              | 7              |
| 1950—51  | 114                             | 3.45         | 65                                | 2.75         | 3.0            | 4.2            |
| 1955—56  | 190                             | 8.22         | 117                               | 7.13         | 4.3            | 6.0            |
| 1960—61  | 344                             | 20.08        | 234                               | 17.84        | 5.8            | 7.6            |
| 1965—66  | 622                             | 38.25        | —                                 | —            | 6.1            | —              |

## VII—Conclusion

This brief review highlights the deep commitment of the founding fathers of the Constitution to the development of human resources; this is clearly evident from the number of articles devoted to this subject in various chapters of the Constitution. The development plans, initiated soon after the adoption of the Constitution in 1950 had the ultimate objective of improving the quality of human resources through the fuller utilization of existing manpower—physical and material resources. This is again reflected in the investment in man—a high priority item in the development plans. The planners have emphasized that planned economic and social development should result in a fuller life of an increasingly larger number of people.

Education and training are, among others, the major instruments for improving the quality of human resources. In this field there have been phenomenal developments. One index is the percentage of expenditure incurred on education and training to the national income; this increased from 1.2 in 1950-51 to 3.1 in 1970-71. If the expenditure on other informal types of education and training is also taken into

consideration, the percentage is likely to be about 4 which, for a country like India, is not a mean figure. The number of literates, as a result of increased educational facilities and intensive literacy programmes, increased from 59 million in 1951 to 160 million in 1971. The total enrolment in various kinds of institutions rose from 13 million in 1951 to 82 million in 1971. What is important is that the enrolment in elementary classes, corresponding to the Constitutional Directive of provision of schooling facilities for children upto the age of 14, increased from 22 million in 1950-51 to 73 million in 1970-71, more than threefold increase. The percentage of pupils at second level (Classes IX-XI) in the proportion to of the estimated population in the corresponding age-group 14-17 in 1950-51 was 5.3 and it increased to 20.4 in 1970-71. The percentage of population in the age-group 17-23, attending post-secondary institutions, of various types, increased from 0.3 in 1950-51 to 3.7 in 1970-71. The percentage of enrolment in science courses to the total enrolment at the university stage increased from 29.1 in 1961-62 to 32.4 in 1968-69. The output of post-graduates in arts and science in 1950-51 was 7,138 and increased to 35,587 in 1965-66 and of doctorates, during the same period was 146 and 907 respectively. Pursuit and promotion of talent has been the cardinal policy of the Government which is evident from the increased allocation of resources for scholarships. The number of teachers, at the first and second levels of education per 10,000 population in 1951 was 21 and it increased to 42 in 1971. The quality of teachers has also improved; as against 57 per cent trained teachers in 1951, the percentage increased to 75 in 1970-71. The number of engineering personnel per 10,000 population in 1960 was 3 and in 1971 it was 9. The number of scientists per 10,000 population in 1965-66 was about 3.5 and their number in 1970-71 increased to 10 which again indicates about three-fold increase.

All this indicates that, in spite of the unprecedented growth in population during the post-independence period, about 52 per cent increase between 1951-71, the country has taken rapid strides in the development of human resources and improvement in its quality. The criteria laid down as the indicators of human resources development, on an international basis, have been fulfilled to a great extent. This by itself is going to have an impact on a well regulated growth in the population during the next twenty years with all its ramification on economic development. Whatever may have been the imperfections in the planning for human resources development during the first 20 years of planning — these are bound to be in any system — one thing is clear that this period has witnessed the steady and solid growth of various institutions, and the building up of an infra-structure which will give a real base for developing human resources on proper lines during the future Plans.

What will have to be thought out and planned carefully is the further diversification of educational and training programmes, both in formal and informal types of institutions — more so in informal types — which will go a long way in the proper utilization of the vast human resources in appropriate fields to achieve the social and economic goals which the country sets out for itself in the years to come.

## CHAPTER V

# CO-OPERATION AND COMMUNITY DEVELOPMENT

In the current phase of economic development in India, with the emphasis given to the spread of high yielding varieties and the application of new technologies in agriculture, greater attention is being devoted to the establishment of higher level institutions for credit and marketing and to individual incentives than to the strengthening of grass-root institutions at the level of the people. This may appear to run counter to the major policy assumptions which, until recently, exerted a powerful influence on India's Five Year Plans. These looked upon co-operation and community development, along with growth in agricultural production, as the main foundation of the effort to transform social and economic life, specially in the rural areas. As was stated in the Second Five Year Plan (1956-61), "In a country whose economic structure has its roots in the village, co-operation is something more than a series of activities organised on co-operative lines; basically, its purpose is to evolve a system of co-operative community organisation which touches upon all aspects of life."

If recent developments and others along the same lines which may follow in the coming years are seen as means to meet new or expanding needs, the foundations could be correspondingly strengthened and continuity of growth assured.

The first co-operative society in the country came into existence in 1891 through voluntary local initiative in a village in the Punjab. The second society which served 22 villages came into being in 1895. Since the Deccan Riots Commission of 1875, the Famine Commission of 1880, the Land Improvements Loans Act of 1883 and the Agriculturists Loans Act of 1884, the need was being increasingly felt for some way of redeeming the cultivator from the clutches of money-lenders, for making finance available on easy terms and improving the condition of the peasantry. In this movement of ideas, Justice M. G. Ranade, Sir William Wedderburn and Sir Frederick Nicholson are among those to be remembered. At the turn of the century, persons of experience and insight realized that Indian agriculture was static, indebtedness was increasing, usury was rampant and that, in the midst of land grabbing by money-lenders, thriftlessness on the part of farmers and growing indebtedness, no real progress was possible. The outcome of this

concern was the enactment of the Co-operative Credit Societies Act, 1904, which established the first legal framework for the co-operative movement in India. However, it was not until the mid-fifties, following the report of the Committee of Direction of the All-India Rural Credit Survey and the Second Five Year Plan, that co-operation came to be regarded as an integral and truly vital part of the scheme of national planning.

The roots of community development also go back over many years. There was deep anxiety about the problems of poverty in India in Dada-bhai Naoroji's famous paper of 1876. The period between the First and the Second World Wars witnessed experiments of real significance in several parts of India, notably under the influence of Rabindranath Tagore and Leonard Elmhirst at Sriniketan in West Bengal, D. Spencer Hatch at Martandam in Kerala, F. L. Brayne in the district of Gurgaon in Haryana, and V. T. Krishnamachari in the district of Baroda in Gujarat. In the thirties, Mahatma Gandhi did much pioneering work at Sevagram; week after week, he drove home the lessons of self-help and self-reliance, the need for reconstructing villages and for putting the idle time and energy of the people to constructive use. During the period immediately following the Second World War, the *Firka* development scheme in Madras, the *Sarvodaya* scheme in Bombay, and the Pilot Development Project at Etawah in Uttar Pradesh under the guidance of Albert Mayer, prepared the way for the acceptance of rural extension as the agency and of community development as the method for rebuilding the social and economic life of India's villages as part of the approach of planned development.

Thus, even though there are important antecedents in other countries upon which they drew, both co-operation and community development were in essence the products of that movement for resurgence which saw the fruition of India's struggle for national freedom. The forms in which these ideas have been expressed since the early fifties, their role in the country's life, the concrete problems which they have thrown up, and their limitations and possibilities in the future, are associated closely with the phase of national planning which was initiated by Jawaharlal Nehru. Since the mid-sixties, with a variety of political, economic and social problems confronting the country, some pragmatic approaches have been developed without being sufficiently integrated into a broad pattern of policy for co-operative action and for development at the level of the community. In this sense, co-operation and community development may be said to be currently in a period of transition. In this chapter, we shall concentrate in the main on the more basic considerations which have guided public policy over the greater part of the past two decades and refer more briefly to the more recent institutional developments and to their probable significance in the future.

## A. CO-OPERATION

### I. Scope

In defining the scope of co-operation and, therefore, of the co-operative sector in the national economy, the following were the principal considerations and assumptions:

- (i) In agriculture, industry and other spheres, the vast majority of operating units are small and individually weak and are constantly exposed to hazards and even exploitation. In effecting reforms in the land system and creating wider opportunities, the number of units which function in a decentralized and almost atomistic manner tends to increase.
- (ii) Through co-operation, it is possible to combine freedom and opportunity for the small man with benefits of large-scale management and organization and, at the same time, to secure goodwill and support from the community. The co-operative form of organization has advantages not equally shared by private enterprise or State ownership and, in particular, it can draw both upon incentives which are social and incentives which are individual.
- (iii) Economic development and social change are equally important elements in the reconstruction of India's social and economic structure. Co-operation is one of the principal means for bringing about changes of a fundamental nature within the economy and in the social organization associated with it.
- (iv) At the level of the village, co-operation implies the development of land and other resources and of various services in the common interest of the village as a whole as well as a continuing obligation on the part of the village community towards all its members. For this reason, as part of a larger co-operative rural economy, the aim of policy should be to develop the village as the primary unit of organization in agriculture and in many other economic and social activities which bear closely on the welfare of the rural population.
- (v) As an organizing principle, co-operation is specially appropriate in spheres of activity in which the primary groups are relatively small and homogeneous and, at the same time, need the support of effective federal structures at higher levels.

It was because of these considerations that the Second and Third Five Year Plans presented co-operation as the principal basis of organization in several branches of economic life, notably, in agriculture, small

industry, processing, marketing, distribution, supplies, rural electrification, housing and provision of essential amenities for local communities. Even in medium and large-scale industries and in transport, an increasing range of functions can be undertaken on co-operative lines. Indeed, in association with a growing public sector and a private sector which keeps in view the interest of the community equally with its own viability, the influence of co-operation should extend far beyond the particular activities which are organized along co-operative lines and should impart to the social structure and the national economy a measure of balance, direction and a sense of values.

It was believed that in the initial stages of development the largest applications of the principle of co-operation would be in relation to the rural economy, but there were also important areas of urban, industrial and tertiary activities in which co-operation could acquire a growing share. As the process of social and economic change gathered force, co-operation would have to meet new and complex demands, and diverse forms of co-operative organizations would continue to take shape to meet these needs. It was, therefore, important that in all aspects co-operation should grow as a movement free from rigidity, regulation and hierarchy to the greatest extent possible, should draw strength from the people, and should always be open to experiment and innovation. In terms of organization, the principle and spirit of co-operation have to be continually preserved against fixed concepts, administrative superimpositions and excessive dependence on Government, on financial agencies and on civic and political institutions outside the main co-operative system.

As we shall see, these formulations did not perhaps reckon sufficiently with the interaction between the institutions of co-operation and the processes of economic growth. Where economic growth proceeds in the main through private effort, whether undertaken by organizations or individuals, co-operative institutions could find themselves on the defensive. They could become inadequate in relation to a wide range of new needs. They could also develop internal tensions between the strong and the weak and often tend to favour the former. Co-operative institutions might be influenced no less than other institutions by the desire of individuals and groups for greater power and influence. Finally, the problem of efficiency remains a crucial one for all forms of organization, and notably for those in which authority tends to be derived from a larger body of constituents and is, therefore, inevitably diffused. Financial weakness and dependence on outside resources also reduce effective autonomy. These are among the aspects which have come into greater prominence in recent years and are already the subject of intensive debate within and outside the co-operative movement.

## II. Review of Developments

Although a few co-operative societies were formed on the initiative of district officers in the early years of the century, it was soon apparent that no real advance could take place without special legislation. A committee with Sir Edward Law as chairman (1901) reviewed the experience of co-operation then available and came to the conclusion that co-operative societies were worthy of every encouragement and of prolonged trial. The committee's recommendations led to the passing of the Co-operative Credit Societies Act of 1904. Under this legislation, co-operative societies were classified into two main groups, rural and urban. While leaving the choice free in respect of urban societies, unlimited liability was proposed as the general rule for rural societies. At this stage, consideration was not given to the question of building up the higher levels in the co-operative structure.

Between 1906 and 1912, the number of co-operative societies rose from 843 to 8,177, the number of members from 90,844 to 403,318 and the amount of working capital from about Rs. 2.4 million to Rs. 33.6 million. A new Co-operative Societies Act, which replaced the legislation of 1904, was passed in 1912. The distinction between rural and urban societies was given up and in its place societies were divided according to as the liability of members was limited or unlimited, whether their purposes related to credit or non-credit activities, and whatever the level in the structure at which they operated. A number of other improvements were also made. In 1914, the position was carefully reviewed by a committee presided over by Sir Edward Maclagan. The Maclagan Committee, whose report is a document of great importance in the development of co-operation in India, devoted its main attention to agricultural credit societies.

In 1921, with the passing of the Government of India Act, which introduced a system of dyarchy in the provinces, co-operation became a 'transferred' subject. By the early thirties, several provinces as well as some of the progressive Princely States had either introduced new co-operative legislation or adapted Central legislation to their requirements. The Royal Commission on Agriculture, which was set up in 1927 with Lord Linlithgow as chairman, also stressed the important role of co-operation, observing that, if co-operation failed, there would fail the last hope of rural India.

The economic depression of 1929-30 caused a serious setback to the co-operative movement, overdues accumulated, recoveries became extremely difficult and many societies and even Central banks came to grief. In several provinces, committees were appointed to recommend measures for the rehabilitation of the co-operative movement. The problem of rural indebtedness and of legislation to protect farmers against

money-lenders came to the fore as an urgent political and economic issue. This was largely due to the depression and the fall in the prices of primary agricultural products. Opinion gained ground that the co-operative movement should be strengthened to the utmost extent as a means of rural uplift. In the late forties, the role of co-operation and the lines along which the co-operative movement should develop were considered by a number of committees and in other forums, including specially the Government of India's Policy Committee on Agriculture, Forestry and Fisheries (1944), the Agricultural Finance Sub-Committee of the Reserve Bank of India (1945), the Co-operative Planning Committee (1945), the Rayalseema Co-operative Enquiry Committee (1945-1946), the Economic Programme Committee of the Indian National Congress (1948), the Rural Banking Enquiry Committee (1949-50) and the Fifteenth Conference of Registrars of Co-operative Societies (1947).

When the Reserve Bank of India was established in 1935, a special responsibility was placed upon it for studying the problems of agricultural credit and extending financial assistance to co-operative institutions. From this date, the Reserve Bank of India came to occupy a central position in the working of the co-operative movement. However, it could not do much during the forties and in the immediate post-war period. The turning point came in 1951 when the Reserve Bank of India convened an informal conference of co-operators, economists and Registrars of Co-operative Societies to help and define the measures needed to enable the Bank to assist co-operative institutions. The conference recommended that, as the factual information available was sparse, a rural credit survey should be undertaken and the nature of credit requirements studied thoroughly. This led to the appointment in August 1951, for the Rural Credit Survey, of a Committee of Direction which included A. D. Gorwala and D. R. Gadgil among its members.

The Rural Credit Survey undertaken by the Reserve Bank of India constituted a scientific and exhaustive enquiry into many crucial aspects of the rural economy on which hitherto little precise data were available. The data collected on a random sampling basis were derived from 127,343 families in 600 villages in 75 districts in the country. They were presented in 1954 in two volumes entitled *The Survey Report* and *The Technical Report* to which was added *The General Report*, containing the recommendations of the Committee of Direction.

Four circumstances lent to the work of the Rural Credit Survey exceptional importance in the development of co-operation in the country. First, the findings were supported by information which had become available for the first time. Secondly, the Reserve Bank of India was now intimately involved in implementation as a principal party and as an initiator in the field of co-operative policy. Inevitably,

from financial questions, it moved into the sphere of policy and approach. Thirdly, the recommendations of the Rural Credit Survey envisaged certain departures in policy and approach. Among these, the most important was the principle of State partnership in co-operative institutions at all levels and in all fields. The Rural Credit Survey aimed at presenting an integrated scheme of rural credit and other economic activities like marketing, processing, storage and warehousing. Its recommendations led to the nationalization of the Imperial Bank of India and its redesignation in July 1955, as the State Bank of India. The proposals of the Committee of Direction for enlarging the size of the primary co-operative with a view to securing and maintaining organizations with trained personnel and adequate skill, raised far-reaching issues, which remained under debate for a number of years. Finally, since proposals for the development of co-operation were now an integral component of the Five Year Plans, which were undertaken jointly by the Centre and the States, the main issues which arose assumed national significance. Centre-State relations as well as questions bearing on the strategy of rural development were implicit in any conclusions that might be reached.

The investigations of the Rural Credit Survey Committee had shown that in 1951-1952 different agencies contributed towards rural credit in the following proportions:

TABLE I

| <i>Credit Agency</i>          | <i>Proportion of borrowings from each agency to the total borrowings of cultivators (per cent)</i> |
|-------------------------------|----------------------------------------------------------------------------------------------------|
| Government                    | 3.3                                                                                                |
| Co-operatives                 | 3.1                                                                                                |
| Commercial banks              | 0.9                                                                                                |
| Relatives                     | 14.2                                                                                               |
| Landlords                     | 1.5                                                                                                |
| Agricultural money-lenders    | 24.9                                                                                               |
| Professional money-lenders    | 44.8                                                                                               |
| Traders and commission agents | 5.5                                                                                                |
| Others                        | 1.8                                                                                                |
| Total:                        | 100.0                                                                                              |

As the Survey pointed out, the available agricultural credit fell short of the right quantity, was not of the right type, did not serve the right purpose and, by the criterion of need (not overlooking the criterion of credit-worthiness) often failed to go to the right people. The cultivator was almost wholly dependent on non-institutional agencies. At the village level, only co-operatives could be a suitable institutional agency for providing credit. Therefore, the foremost objective of policy had

to be the positive and deliberate creation of conditions in which co-operative credit would have a reasonable chance of success.

Its analysis of the causes of the failure of co-operation led the Committee of Direction to the view that, while co-operation provided for a combination of the weak at the bottom, the State is or ought to be a combination for the weak at the top. An effective programme would become possible only if the State at one end joined hands with co-operatives at the other, thus bringing about a reorientation of the country's administrative, financial and organizational forces in favour of rural areas. More concretely, the Rural Credit Survey envisaged a scheme of State partnership at all levels with co-operatives concerned with credit, processing, marketing and other spheres, supported by the institutional development of storage and warehousing as a basis for bank finance. The Survey also placed much emphasis on systematic training of personnel required at all levels. These proposals were spelt out at considerable length in the Report on the Survey, and formed the basis of the programme for co-operative development in India's Second Five Year Plan (1956-61). Action was initiated in a number of directions. However, on one major issue — the question of size of the primary co-operative — there were strong reservations on the part of the Planning Commission, which were also shared by the then Prime Minister, Jawaharlal Nehru. The discussion simmered on until November 1958, when the National Development Council passed a resolution on co-operative policy.

The National Development Council considered the role of the co-operative movement from an angle much broader than that of rural credit. It was concerned with intensive agricultural production, mobilization of local manpower and other resources and, more generally, with the central question of the lines along which the rural economy as a whole was to be rebuilt. The Council considered that—

"For the development of co-operation as a people's movement, it was essential that co-operatives should be organized on the basis of the village community as the primary unit, and that responsibility and initiative for social and economic development at the village level should be placed fully on the village co-operative and the village panchayat... In a rural co-operative, the members should have intimate knowledge of one another as well as a sense of mutual obligation and concern for the rehabilitation of the weaker sections of the community. By working together for the common objective of raising the standard of living of all sections of the population, the community develops social cohesion and unity."

Following the Resolution of the National Development Council, a new Department of Co-operation was established at the Centre as part of the Ministry of Community Development and Co-operation, which took over functions in this field from the Ministry of Food and

**Agriculture.** The implications of the Resolution were examined by a Working Group on co-operative policy which reported in June 1959. At the suggestion of the State Ministers in charge of co-operation who met in July 1959, a Committee on Co-operative Credit, with Vaikunth L. Mehta as chairman, was set up by the Government of India to consider various practical issues such as standards to be prescribed for credit limits, loan policies and practices of co-operative credit institutions at different levels, measures necessary for increasing the borrowing powers of primary credit societies, and the conditions which should govern share capital participation by the State in primary societies. The recommendations of this Committee were taken into consideration in formulating proposals for the Third Five Year Plan. Conclusions reached with the approval of the National Development Council on the question of size of the primary co-operative, which had proved a difficult issue for as long as five years, were set out in the following terms in the Third Five Year Plan (1961-66):

"While, as a general rule, co-operatives should be organized on the basis of the village community as a primary unit, where villages were too small, the number of villages to be served by a co-operative society could be increased in the interest of viability. The aim should be to ensure viability with the inclusion of the smallest number of villages necessary, so that co-operative societies could achieve both viability and the essential characteristics of co-operation, namely, voluntary basis, close contact, social cohesion and mutual obligation. However, such extension should be subject to certain maximum limits, namely a population of 3,000 (that is, 600 families or about 500 cultivators' families) and a distance of not more than 3 or 4 miles from the headquarters village.

"The broad test of viability should be the ability on the part of a co-operative society to meet the requisite expenses without depending upon financial assistance from Government except for a limited period. However, potential viability should always be assessed on the basis of a programme for fulfilling certain essential conditions, such as bringing into the co-operative all rural families, effective implementation of the village agricultural production plan, linking credit with production and with marketing, supervision of the use of credit, undertaking the functions of distribution and supply, and attracting local savings to the maximum possible extent, as share capital and as deposits. While a population of 3,000 might ordinarily be too high for a primary village society, it was considered desirable to avoid laying down unduly rigid rules on the subject of organisation and size of co-operative societies. Within this broad framework, co-operative societies should be allowed to develop on their own. Particular care should be taken to ensure that existing societies were not interfered

with merely because they did not strictly comply with the pattern of organisation now envisaged. The aim should be gradually to fit them into the new arrangements."

On the basis of the general approach stated above, the Committee on Co-operative Credit outlined its detailed proposals for State participation in share capital and other aspects of co-operative organization. The present policy follows these proposals and includes determination by State Governments of criteria for the viability of primary co-operatives, a programme for enabling potentially viable societies to become viable, and amalgamation or liquidation of weak societies.

The programme for the reorganization of primary co-operative societies described above has been under way for some years. The emphasis on intensive agriculture and on the adoption of high yielding varieties has increased the demand for credit and made it more urgent to complete the programme for reorganization at the primary level. The All-India Rural Credit Review Committee constituted by the Reserve Bank of India in July 1966, with B. Venkatappiah as chairman, submitted in December 1969, its exhaustive review of the rural credit problem in all its aspects. The Committee has reiterated the need for viable primary units and, while not seeking a decision in principle to change the policies agreed to in the early sixties, has suggested various directions in which relaxations in terms of area and population might be encouraged at the primary level. For a variety of reasons, more specially in view of the developments of recent years, the issue of size is now one of practical convenience and local acceptance rather than of basic policy. In varying situations the two sets of considerations which led to the debates of the period 1956-60 would still continue to be important. However, with the nationalization, in August 1969, of the major scheduled commercial banks, the larger demands for credit which have to be met, far exceeding the resources of the co-operative structure, and the greater emphasis currently given to the individual farmer as distinct from the rural community, the issue of viability of primary societies has to be seen in a different and more complex perspective than in the earlier period.

In the first half of the decade of the sixties, almost all aspects of co-operative development came under review by a series of special committees and in conferences of State Ministers of Co-operation and in other forums. These included, for instance, questions pertaining to credit, marketing, processing, farming, transport, labour and construction, training of personnel, administration, consumer co-operatives, non-credit co-operatives, relations between panchayats and co-operatives, and relations between co-operation and community development. To an extent, the wide range of these enquiries, each of which was conducted by a separate body with its own frame of reference, came in the way of

achieving a measure of synthesis in dealing with the practical problems of co-operative development. Useful in their own context, these enquiries lacked a unifying concept about the future organization of agriculture and the directions along which the entire rural structure was expected to develop over a period of years. Moreover, the serious failure of agriculture in 1965-66 and 1966-67 and the marked sense of economic crisis which enveloped the country in this period drew a curtain, as it were, on much that had gone before, and set the stage for a search for new policies.

### III. Statistics of Development

In this section we bring together a few leading statistics to show the growth of the co-operative movement. The period preceding the Five Year Plans was marked by expansion in the number of societies and in membership, but the scale of operations undertaken remained small. The Central Government had little or nothing to do with the development of co-operation, which was a task left to the provinces. The emphasis on co-operative development had been placed mainly at the lower levels of organization without sufficient recognition at this stage of the importance of wider institutional and governmental support. The Table below summarizes the growth of co-operative credit societies at the primary level over the period 1919-1920 to 1949-1950. A considerable administrative effort went into co-operation in the decade of the twenties; the thirties were a period of difficulty and stagnation, and only in the later years were the losses caused by the depression made good; during the forties, co-operatives gained from rise in agricultural prices and the growing demand for the products of small industry.

TABLE II  
Primary Co-operative Credit Societies, 1919-20 to 1949-50

| <i>Primary Societies</i>                        | 1919-20 | 1929-30 | 1939-40 | 1949-50 |
|-------------------------------------------------|---------|---------|---------|---------|
| <b>Number</b>                                   |         |         |         |         |
| Agricultural                                    | 25,873  | 83,093  | 101,507 | 133,616 |
| Non-agricultural                                | 1,662   | 8,862   | 14,324  | 24,586  |
| <b>Membership (000)</b>                         |         |         |         |         |
| Agricultural                                    | 903     | 2,792   | 3,438   | 6,560   |
| Non-agricultural                                | 226     | 897     | 1,639   | 4,172   |
| <b>Paid-up share capital (Rs. million)</b>      | 25      | 99      | 136     | 284     |
| <b>Loans advanced during year (Rs. million)</b> | 50      | 204     | 211     | 521     |

Since the early fifties, co-operative development has been an integral part of the scheme of national planning. This has aided the growth and

diversification of the co-operative structure and, at the same time, it has provided new criteria for assessing its progress and adequacy in relation to the requirements of the economy, specially in the agricultural sector.

The Table below traces the growth of primary co-operative credit societies since 1950-51:

TABLE III  
Co-operative Credit Societies, 1950-51 to 1969-70

| Primary Societies                   | 1950-51 | 1955-56 | 1960-61 | 1966-67 | 1969-70 |
|-------------------------------------|---------|---------|---------|---------|---------|
| <b>Number</b>                       |         |         |         |         |         |
| Agricultural                        | 104,998 | 159,939 | 212,129 | 178,735 | 162,700 |
| Non-agricultural                    | 7,810   | 10,003  | 11,995  | 13,616  | 14,816  |
| <b>Membership (000)</b>             |         |         |         |         |         |
| Agricultural                        | 4,408   | 7,791   | 17,041  | 26,709  | 29,766  |
| Non-agricultural                    | 2,178   | 3,073   | 4,573   | 7,485   | 7,942   |
| <b>Share Capital (Rs. million)</b>  |         |         |         |         |         |
| Agricultural                        | 76      | 168     | 578     | 1,286   | 1,811   |
| Non-agricultural                    | 121     | 191     | 330     | 664     | 876     |
| <b>Loans advanced (Rs. million)</b> |         |         |         |         |         |
| Agricultural                        | 229     | 496     | 2,028   | 3,665   | 5,401   |
| Non-agricultural                    | 473     | 721     | 1,304   | 2,802   | 4,093   |

The co-operative structure for short and medium-term credit included at the end of 1969-70, in addition to primary co-operatives, 25 State co-operative banks, 342 Central co-operative banks, and 27 industrial co-operative banks. For long-term Credit, the institutional structure comprised 19 Central and 754 primary land mortgage banks. The performance of various institutions has been examined at length by the All-India Rural Credit Review Committee and will be referred to in the following section.

Since the early fifties, a factor of the greatest importance has been the role of the Reserve Bank of India in supporting the co-operative rural structure in a variety of ways, including short and medium-term advances for seasonal agricultural operations and marketing of crops, loans to State Governments for contributing to the share capital of co-operative credit institutions, and investments in debentures issued by land development banks. Both the scope and the scale of participation on the part of the Reserve Bank of India have increased steadily in response to growing needs for credit.

The Bank's role has been recently considered at length by the All-India Rural Credit Review Committee (1969). As the Committee has pointed out, the Bank undertakes, at the same time, financing functions, promotional, advisory and co-ordinating functions, and regulatory func-

tions. For the year ending June 1971, financial support from the Reserve Bank comprised the following:

TABLE IV

|                                                        | <i>Limits Sanctioned</i><br>(Rs. million) | <i>Amount Outstanding</i> |
|--------------------------------------------------------|-------------------------------------------|---------------------------|
| <b>Short-term accommodation</b>                        |                                           |                           |
| For agricultural purposes                              | 3,901                                     | 1,884                     |
| Fertilizer distribution                                | 192                                       | 34                        |
| <b>Medium-term loans</b>                               |                                           |                           |
| For agricultural purposes                              | 187.6                                     | 243                       |
| <b>Loans to State Governments</b>                      |                                           |                           |
| For share capital contribution                         | 118.8                                     | 419.3                     |
| <b>Investment in debentures of land mortgage banks</b> | 41.6                                      | —                         |

The expansion of the Indian economy over the past two decades has thrown up new opportunities for increasing co-operative activity outside the sphere of credit. Although there were some significant developments during the fifties, much of the increase, as shown in the Table below, has taken place in recent years only, and this trend is expected to gain in strength over the next few years.

TABLE V  
Primary Non-credit Societies

| <i>Type of Society</i>      | 1960-61       |                            | 1968-69       |                            |
|-----------------------------|---------------|----------------------------|---------------|----------------------------|
|                             | <i>Number</i> | <i>Membership</i><br>(000) | <i>Number</i> | <i>Membership</i><br>(000) |
| Marketing                   | 3,108         | 1,468                      | 3,342         | 2,633                      |
| Cotton ginning and pressing | 128           | 59                         | 162           | 118                        |
| Other processing            | 3,103         | 121                        | 1,308         | 195                        |
| Sugar factories             | 66            | 177                        | 99            | 419                        |
| Farming                     | 3,184         | 88                         | 8,143         | 211                        |
| Weavers'                    | 11,803        | 1,311                      | 12,373        | 1,259                      |
| Other industrial            | 21,288        | 1,217                      | 34,909        | 1,693                      |
| Consumers' stores           | 7,058         | 1,341                      | 13,913        | 3,531                      |
| Housing                     | 6,451         | 379                        | 15,029        | 996                        |

At the end of 1968-69, the total number of non-credit societies of all kinds, including agricultural and non-agricultural, stood at 136,472, their total membership being over 18 million and working capital Rs. 10,791 million.

There has been significant advance in the consumers' co-operative movement, specially since 1962. In the main, the movement still serves

only the urban areas. By June 1970, the co-operative system included a national federation, 14 State federations, 375 Central or wholesale stores with 2,800 branch stores, and about 14,000 primary stores, of which about 3,500 were described as "dormant". A development in recent years in the larger cities has been the establishment of department stores (or super bazars), of which there are now over 100. At the end of 1969-70, the working capital of consumers' co-operatives amounted to Rs. 315 million, and their membership included 912,000 individuals and 17,265 institutions.

Co-operative processing and marketing now constitute important areas of co-operative enterprise. The co-operative structure for marketing consisted in June 1970, of 3,339 primary societies at the level of the local market, 162 Central marketing societies at district or regional level, 23 State marketing federations and a national federation. Primary co-operatives had as members 172,411 co-operative societies (mainly service co-operatives) and 2.46 million individuals. The total volume of agricultural business transacted by marketing co-operatives was estimated in 1969-70 at Rs. 5,990 million, which included Rs. 2,090 million in food-grains, Rs. 2,550 million in sugar-cane, and Rs. 1,350 million in other crops.

The movement for co-operative processing has gained considerable strength from the small beginnings made in the fifties. By the end of 1969-70, 1,617 co-operative processing units had been organized, including 84 co-operative sugar factories, 237 cotton ginning and processing units, 26 cotton spinning mills, 792 paddy processing units, 192 oil mills, and 38 fruit and vegetable units. Co-operative sugar factories licensed upto 1969-70 represent 47.3 per cent of the total licensed capacity of the sugar industry.

Agricultural production requisites supplied to rural areas through co-operatives include fertilizers, pesticides, seeds and implements. In 1969-70, the total volume of business in these commodities handled by co-operatives was Rs. 2,833 million compared to Rs. 2,534 million in 1968-69. Co-operative business in agricultural machinery is expected to pass progressively to agro-industries corporations which have now been established in all States. In recent years, storage capacity in the hands of co-operatives has increased gradually. In 1970, there were 15,000 rural godowns and 4,000 godowns with marketing co-operatives with an estimated capacity of 2.7 million tonnes. In rural areas, to a limited extent, co-operatives undertake the distribution of consumer articles, mainly through primary agricultural societies supported by marketing co-operatives. In 1969-70, they transacted business of the order of Rs. 2,257 million. Co-operative cold storages have increased steadily in recent years. By the end of 1970, 91 units had been organized and 67 installed.

In June 1969, there were in all 8,160 co-operative farming societies with 219,329 members, of whom 104,621 were agricultural labourers. The total area under cultivation was 280,435 hectares.

In June 1969, there were 15,029 housing co-operatives with a total membership of 999,526.

Spinning mills represent a comparatively new field of co-operative activity. By 1968-69, 61 co-operative spinning mills had come into existence with 15,317 societies and 116,714 individuals as members. They had in all 868,546 spindles.

Planned development and the growing requirements of the economy on the one hand and the need to improve the rural economic structure on the other have combined to strengthen conditions for the rapid development of co-operative activities. Under each of the Five Year Plans, sizeable financial provisions have been made for assisting programmes of co-operative development. Financial provisions for the support of co-operative activities have been made in the plans for agriculture, which mainly form part of the plans of States. Expenditure on co-operation in the First Plan (1951-56) amounted to Rs. 50 million, in the Second Plan (1956-61) to Rs. 380 million, and in the Third Plan (1961-66) to Rs. 770 million. Expenditure under annual plans during the period 1966-69 amounted to 639 million. The Fourth Plan (1969-74) provided Rs. 2,550 million for the development of co-operation.

### V. Co-operative Credit

Developments in co-operative policy traced earlier had considerable bearing on the organization and pattern of co-operative credit. From the beginning, the stress was on making adequate supplies of credit available for agricultural production. The Bombay State Co-operative Bank had taken the lead in 1950 in providing finance to agriculturists on the basis of requirements for crop production in place of landed assets. The organizational and other aspects of the crop loan system were worked out at some length by the Crop Loan Evaluation Committee set up by the Bombay State Co-operative Bank, with Professor D. G. Karve as chairman (1958). The crop loan system envisages assessment of the cultivator's credit needs with reference to requirements for different crops, determination of credit limits subject to repaying capacity, advance of credit partly in cash and partly in kind, and linking of credit with marketing. In recent years, efforts have been made to extend the crop loan system, where necessary with modifications, in most of the States. There are, however, still large gaps in its coverage, as well as deficiencies in the procedures being followed. A series of recommendations on the subject were made by the All-India Rural Credit Review Committee (1969).

A number of complex factors enter into the expansion of co-operative credit. Many primary co-operatives and a proportion of Central co-operative banks are inherently weak. The Committee on Co-operative Credit (1960) made proposals for the reorganization and revitalization of primary credit societies. On the basis of these proposals, revitalization and strengthening of primary credit societies is now viewed as a programme calling for sustained action. The number of primary agricultural credit societies fell from 212,129 in 1960-61 to 162,700 in 1969-70, and is expected in due course to decline to around 120,000. Similarly, along with the reorganization of primary societies, a programme for rehabilitating weak Central co-operative banks is also being implemented. The main element of weakness is of course the farmer himself.

Special measures were needed for ensuring credit for low income farmers. A study undertaken by the Programme Evaluation Organization of the Planning Commission showed that in 1960-61 only about 15 per cent of the credit given by co-operatives was received by members with 1.21 hectares of land or less as against 39 per cent received by those with 2.02 to 4.05 hectares and 46 per cent by cultivators with still larger holdings. The Third Five Year Plan had laid stress on admission into co-operative societies as members of all classes of cultivators, including marginal and sub-marginal cultivators and landless tenants, and on providing them with adequate credit on the basis of their production. To facilitate such action, it was agreed that State Governments should make outright contributions to primary societies in relation to additional loans made during a year as against the preceding year. Outright contributions were also to be made to the bad debt reserves of Central co-operative banks in respect of additional finance provided by them. A higher level of outright grants was agreed to for intensive agricultural areas and for high-yielding varieties. To strengthen the management of credit societies, a subsidy was allowed for a period of three to four years, subject to certain financial limits and the actual deficits incurred. The measures led to some liberalization of credit facilities for the weaker farmers, but much more had to be done. The experience gained thus far was studied by the All-India Rural Credit Review Committee and, on the basis of its proposals, Small Farmers' Development Agencies are being established, to begin with, in 46 districts. While making use of the existing institutional structure, these agencies have been provided with modest additional resources to assist "potentially viable farmers" to obtain credit both for short-term and long-term purposes, with provision for an element of subsidy. The problems of small farmers go far beyond the grant of credit and the scheme is to be regarded at present as an experiment to be followed carefully.

The various measures taken to support co-operative credit have led to fairly rapid expansion in membership and in the volume of credit.

The expansion has not been as great as was envisaged in the Resolution of the National Development Council on Co-operative Policy in 1958, nor has it kept pace with the growing requirements of agricultural production. There are, moreover, certain features in the expansion of credit which have caused a measure of apprehension. In recent years, overdues have increased greatly in volume as well as in proportion. They amounted to Rs. 440 million in 1960-61, Rs. 1,250 million in 1965-66 and Rs. 2,680 million in 1969-70. As a proportion of outstanding loans, overdues have increased from 20 per cent in 1960-61 to 29 per cent in 1965-66 and 37.7 per cent in 1969-70. In some States, the proportion of overdues has been exceedingly high.

Increase in the scale of operations has not always been accompanied by adequate control over the use of credit. The Programme Evaluation Organization's Study referred to already showed that 23 per cent of the amount borrowed for short-term purposes was diverted to uses other than those intended. In the case of medium-term loans, the proportion was even higher, being as much as 35 per cent. For short-term and medium-term loans together, the extent of diversion was estimated at 28 per cent.

Credit co-operatives at various levels have tended to develop certain organizational weaknesses to which the leadership of the co-operative movement has paid insufficient attention. Experience has shown that, in their day to day operations, co-operatives, which are basically intended to protect the small man from exploitation, may all too easily favour the strong at the expense of the weak and themselves become an instrument for the acquisition of economic power and for securing larger facilities for the better off cultivators. Co-operative principles such as open membership, democratic control, genuine leadership and continuous improvement in efficiency and operational practices cannot be ensured without responsible supervision by the higher levels of the co-operative structure and leadership, extensive education of members and officials, widespread vigilance and inner democracy within every organization that describes itself as a co-operative.

It is customary to record together statistics of short and medium-term loans advanced through co-operatives. In point of fact, these loans are almost wholly short-term in nature. Between the general co-operative structure which caters mainly to short-term credit and land development banks which provide long-term credit, the need for medium-term loans, which are required for a variety of productive agricultural purposes, is but poorly served. The proposals made by the All-India Credit Review Committee (1969), being limited to minor modifications of existing practices, do not promise a material change in the present situation. The amount of medium-term credit disbursed by co-operatives during the year increased between 1960-61 and 1969-70

from Rs. 200 million to Rs. 523 million. Credit limits sanctioned by the Reserve Bank of India, which stood at Rs. 188 million in 1970-71, were utilized to the extent of 63 per cent.

Long-term agricultural finance is a pressing need to which increasing attention has been given in recent years. At the end of 1969-70, there were 19 Central land development banks at the State level and 809 primary land development banks. Between 1950-51 and 1969-70, loans advanced to individuals increased from less than Rs. 14 million to Rs. 1,132 million and loans outstanding from Rs. 66 million to Rs. 3,668 million. Significant progress was made after 1960-61. The Reserve Bank of India, the State Bank of India and the Life Insurance Corporation have together extended growing support from year to year for the purchase of debentures of land development banks. The total amount of debentures floated in 1970-71 was estimated at Rs. 1,270 million.

An institution of potential importance came into existence with the passing of the Agricultural Refinance Corporation Act, 1963. The Corporation provides refinance facilities to co-operative banks as well as joint stock banks in the form of medium-term and long-term resources for special schemes of agricultural development undertaken on a project basis. These facilities are intended to supplement long-term resources provided by land development banks. In respect of schemes implemented through land development banks, the Agricultural Refinance Corporation generally provides 75 per cent of the funds, Government providing the remaining 25 per cent. By the end of 1969-70, the Corporation had entered into commitments in respect of 371 agricultural schemes, amounting in all to Rs. 2,150 million. Of this amount, Rs. 590 million had been drawn. The States which have been able to take material advantage of facilities offered by the Agricultural Refinance Corporation include Andhra Pradesh, Gujarat, Karnataka, Punjab, and Tamil Nadu.

In recent years, growing concern has been felt about disparities in levels of co-operative development in different States in the country. These express themselves in many ways, for instance, in the degree to which cultivators continue to depend on agricultural money-lenders and other non-institutional sources of finance, volume of resources and operations of the co-operative system, overdues, etc. The All-India Rural Debt and Investment Survey, 1961-62, organized by the Reserve Bank of India to record changes since the Rural Credit Survey of 1951-52, threw considerable light on this problem. The Survey also showed that non-cultivator households had been virtually neglected by co-operative organizations. Thus, while co-operatives of all kinds accounted for 15.5 per cent of the total borrowings of cultivator households, in the case of non-cultivators, the proportion was 5.3 per cent. The borrowings of cultivators from co-operative institutions amounted to Rs. 1,605

million, and those of non-cultivators to Rs. 109 million.

The problem of uneven development as between different parts of the country received close attention from the Informal Group on Institutional Arrangements for Agricultural Credit, which included several leading figures of the co-operative movement and reported to the Reserve Bank of India (1964). The following Table, based on the Group's analysis, illustrates the situation of cultivators as between different States:

**Table VI**  
**Co-operative Credit: Cultivator Households, 1961-62**

| <i>State</i>           | <i>Members of co-operative societies as proportion of cultivator-households (%)</i> | <i>Proportion of borrowing members to total cultivator-households (%)</i> | <i>Loans and advances by co-operative institutions as proportion of total borrowings (%)</i> |
|------------------------|-------------------------------------------------------------------------------------|---------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|
| (1)                    | (2)                                                                                 | (3)                                                                       | (4)                                                                                          |
| 1. Maharashtra         | 53                                                                                  | 34.9                                                                      | 54.9                                                                                         |
| 2. Gujarat             | 47                                                                                  | 30.3                                                                      | 40.9                                                                                         |
| 3. Madras (Tamil Nadu) | 86                                                                                  | 40.1                                                                      | 30.9                                                                                         |
| 4. Orissa              | 13                                                                                  | 6.5                                                                       | 27.6                                                                                         |
| 5. Punjab              | 88                                                                                  | 42.2                                                                      | 27.1                                                                                         |
| 6. Madhya Pradesh      | 23                                                                                  | 15.6                                                                      | 24.8                                                                                         |
| 7. Uttar Pradesh       | 39                                                                                  | 22.5                                                                      | 23.6                                                                                         |

The uneven rate of development of co-operation in different States is explained by a number of institutional and other factors. The conclusion to be drawn from a study of these factors is that for the development of co-operative credit along sound and promising lines, there is need to evolve approaches appropriate to the conditions of each State. This aspect was considered by the Informal Group mentioned above. The Group affirmed that co-operatives were the best institutional agency for providing agricultural credit. The structure and policies already developed could ensure adequate credit facilities for agricultural production in areas of relative progress such as the States of Maharashtra, Gujarat and Tamil Nadu. In these, with improved implementation, further progress could be hoped for. There were also a number of States which fell within an intermediate category in which, if the

requisite efforts were made over a period, co-operative development on an adequate scale could still be secured. There was a third group of States in which the task of providing agricultural credit and building up the necessary institutions was one of formidable dimensions. These included Assam, West Bengal, Bihar, Orissa, Rajasthan, Manipur and Tripura. While the long-term approach in these areas would be in favour of development along co-operative lines, in the first phase, a series of remedial measures were called for. Since societies at the primary level were generally weak and revitalization would take time, it would be necessary to arrange for financing of cultivators by Central banks directly; in some cases, even primary societies might have to be financed by banks. At the primary level there would be need for a prolonged and thorough programme of rectification and revitalization. At every stage, it would be important to strengthen co-operative administration and leadership. The Informal Group proposed that, as a transitional arrangement, in the States of Assam, Bihar, Orissa, West Bengal and Rajasthan, agricultural credit corporations should be set up by the State Governments concerned under enabling legislation to be enacted by Parliament. Normally, the agricultural credit corporation should function in areas in which active co-operatives were not available or where existing co-operatives could not be easily activated. In other words, areas of operation for credit corporations should be demarcated in advance. Being conceived of as transitional arrangements, in principle, the corporations should be in a position to withdraw from the field when the agricultural co-operative structure was able to take over responsibility for credit. The corporations should provide short-term loans for agricultural production on the basis of the crop loan system, conducting their operations so that, eventually, the building up of an effective co-operative network was facilitated. Legislation on the lines proposed by the Group was enacted in 1968.

With the development of improved types of agriculture through programmes for intensive areas and for high-yielding varieties, a growing segment of agriculture is assuming a commercial character. As the estimates brought together in the Report of the All-India Rural Credit Review Committee (1969) bear out, credit requirements of agriculture are increasing rapidly and are becoming more varied and complex. For some years, the need was being already felt to draw commercial banks into the sphere of agricultural credit, while emphasizing at the same time that co-operatives should be developed as the main institutional agency for the provision of credit for agriculture. The issue came to a head in 1968 when, as part of the scheme for social control over banking, the National Credit Council constituted a Study Group under the Chairmanship of D. R. Gadgil, on Organizational Framework for the Implementation of Social Objectives. With the nationaliza-

tion, in August 1969, of the major commercial banks, it became possible to view the commercial and co-operative structures as complementary and mutually supporting. Each structure had its strong and weak points. These were analyzed by the Study Group which came to the conclusion that commercial banks could help fill large gaps in the sphere of agricultural production credit and that the best approach to co-ordination between the nationalized and the co-operative banks would be to relate their respective contributions to the requirements of specific districts. Following this "area approach", in 57 districts in the States of Andhra Pradesh, Karnataka, Madhya Pradesh, Haryana and Uttar Pradesh, financing of 2,121 co-operative societies has been entrusted to commercial banks through their branch offices. Through standing committees at the State level and procedures drawn up by the Government, the Reserve Bank of India and others concerned, it is hoped to ensure the necessary co-ordination, and to facilitate the operations of commercial banks without cutting the ground from under the co-operative system. The working of these and related arrangements will need to be observed carefully, for, essential as it is to meet the credit gap, it has to be remembered that there is in the existing circumstances a marked bias in favour of better-placed farmers and the more favourably situated regions and areas and that, without strong pressures in the contrary direction, this bias is likely to be further strengthened. The possibility that over a period co-operatives may come to be regarded increasingly as agencies designed to serve the weaker sections among cultivators rather than the rural community as a whole will have to be guarded against. Likewise, there will be need for vigilance lest co-operatives come to identify themselves with the 'viable' and the middle and upper group of farmers and seek to turn over to new rehabilitation finance agencies the requirements of the petty farmer, the tenant, the artisan and the landless farmer.

The progress and effectiveness of co-operative credit hinges largely on steps taken to link credit with marketing. Although some advance has been made and progress, specially in Maharashtra and Tamil Nadu, can be described as notable, in the country as a whole, the link between credit and marketing is still far from established. Thus, in recent years there has been little significant change in the proportion of primary societies affiliated to marketing societies, or in the proportion of short and medium-term loans advanced by credit societies recovered through sale proceeds. In a favourable agricultural year, such as 1964-65, these proportions stood respectively at 60 and 30 per cent. Marketing of produce through co-operatives is an essential element in a system of production-oriented credit, but it is not enough merely for loans advanced by co-operatives to be recovered through such sales. Indeed, the aim must be that, besides such re-

coveries, co-operative marketing should become the normal mode of sale for all agricultural produce. The direct and indirect benefits of strengthening co-operative marketing are of consequence equally for the cultivator and the national economy as a whole. The details of the action required are already well established, and the essential question is one of effective implementation.

#### V. Co-operative Marketing and Processing

The principle of State partnership in co-operatives has been an important factor in the expansion of co-operative marketing. Nearly three-fourths of primary co-operatives are at present organized on this basis. Co-operative marketing societies are now able to assume expanding functions in the context of State trading, in the procurement operations of the Food Corporation of India, and in developing exports of commercial crops. In States in which the Food Corporation of India has been appointed as the sole procuring agent on behalf of the Government, as a rule, co-operatives are utilized as sub-agents side by side with private agencies. In Maharashtra, Karnataka, Assam, Tamil Nadu, Punjab, Kerala and Gujarat, co-operatives are used as the only purchase agency for Government either in specified areas or in relation to specified crops. In inter-State trade and in the export of products like banana, copra, oil-cakes, onions, fruits and vegetables, marketing co-operatives are beginning to participate on a growing scale.

Reference has been made earlier to agricultural business transacted by marketing co-operatives. In the distribution of fertilizers and other agricultural requisites, the earlier trend to enlarge the scope of co-operatives has been recently reversed to an extent, specially for fertilizers. In 1969-70, co-operatives distributed fertilizers to the tune of Rs. 2,325 million. Beginning in 1966-67 with an option to fertilizer factories to sell 30 per cent of their output in the free market, the concession has now been extended to their entire production if they so choose. The emphasis in public policy has shifted, consequently, from assuring a clear-cut area of opportunity through supply of adequate credit and other support to enabling co-operatives to compete on more or less even terms with private trade. It is yet early to judge the results of this change of policy.

Marketing and distribution operations on any considerable scale involve problems of organization and management whose importance has been fully recognized. A committee on Co-operative Marketing, which reported in 1966, recommended a three-tier structure in marketing co-operatives, with the apex society at the State level, primary marketing societies at the level of the local market, and branches of the apex marketing society at district or regional level. To assist changes along these lines, it has been proposed that, where federations already exist

at the district level, as part of a three-tier structure, they should gradually divest themselves of those functions which fall properly within the purview of primary marketing societies.

Marketing, distribution and supply constitute a connected set of activities, and it is considered desirable that these should be combined within the same co-operative. In some areas, where particular crops predominate, there is scope for marketing societies dealing with individual commodities, but, frequently, in view of the scale of business and the economies available, the interests of co-operative development are better served through general marketing co-operatives.

The contribution which co-operative processing could make to the strengthening of marketing facilities and adoption of improved and scientific methods in agriculture is best illustrated by the growth of co-operative sugar factories, to which reference has been made earlier. From the production of sugar, co-operative processing has now extended to the manufacture of by-products like alcohol, and recently licences have been given to co-operative units for the manufacture of newsprint and paper from bagasse.

In the expansion of processing in branches of industry other than sugar, there has been a fair amount of development in the co-operative sector over the past decade, but the growth has been generally less satisfactorily planned and supported and has been somewhat sporadic.

The emergence of an industrial sector in the co-operative movement has inevitably brought up problems of organization and management similar to industry in general. Foremost among these is the question of efficiency in management, training and employment of managerial cadres, planning of projects, finance and profitability of individual enterprises, and conditions for the effective utilization of available capacities. In May 1967, a National Institute of Co-operative Management was established for providing basic training in management to co-operative personnel. The practical working of co-operative industrial establishments has reinforced the view that co-operation must succeed in its business aspects if it is to fulfil its role as a movement deriving substantial local support within each region. The various problems which need to be resolved in this connection were reviewed in 1961 by a committee on co-operative processing and, in 1968, by an expert committee on financing of co-operative processing.

## VI. Consumer Co-operatives

In several countries, consumer co-operatives account for one-fifth or more of the total volume of business in the distribution of consumer goods and serve both urban and rural areas. They are, thus, able to act as a check on private traders in price and quality and, in turn, they

are themselves compelled to observe high standards of efficiency. In essential commodities of daily use, their role is invariably much larger than in luxury, semi-luxury or branded products. In this sense, in India, consumer co-operation has yet to become a really significant movement. During the Second World War, with a view to participating in the distribution of articles whose prices were sought to be controlled by the Government, numerous primary stores were set up. In 1951-52, there were 9,757 primary stores with a membership of 1.85 million and a total business of Rs. 820 million. The numbers fell until, in 1957-58, there were 6,435 stores with less than 1.4 million members and a total business of Rs. 230 million. Of these, only a third were running at profit. The original Third Plan targets were modest, providing for the formation of 50 wholesale and 2,200 primary stores. However, following the emergency in 1962, with a view to the distribution of essential consumer goods at reasonable prices, countering price increases and protecting the public interest, an expanded programme was taken in hand.

In June 1966, following the devaluation of the rupee, when inflationary pressures were likely to become more intense, the Central Government sponsored a new programme, which included the setting up of 101 additional wholesale stores, 2,000 primary stores and 43 department stores. It was envisaged that, over a period, all districts with an urban population of 50,000 or more should come to possess wholesale co-operative stores of their own and, further, that department stores should be established in all cities with a population of 100,000 or more. Besides consumer co-operatives in towns and cities, under schemes sponsored by the Ministries concerned, there were in 1967-68, 2,236 primary consumer co-operative stores in industrial undertakings employing 300 workers or more, and 426 consumer co-operatives organized by workers on the railways, and 13 among coal and mica workers. Beginnings have also been made in the organization of consumer co-operatives for Central and State Government employees and at university centres. For the rural areas, a modest start was made in 1963 with retail distribution by co-operative marketing societies at the centres at which they functioned, distribution in the villages being done through service co-operatives affiliated to them. Thus far, the impetus for the setting up of consumer co-operatives has come mainly from the Government in the shape of assistance towards share capital, grants for fittings, fixtures, godowns and vehicles, and managerial subsidies. While there cannot yet be said to be an independent consumers' co-operative movement functioning on a country-wide basis, conditions are ripe for the growth of such a movement, and efforts have been and are being made to solve some of the practical, financial, management and supply problems of consumer stores, to provide for supervision and inspection, to enlarge

the size of co-operative stores, and to diversify the range of business. With effective and sustained support from the Central and State Governments and from civic agencies, it is now possible to achieve growth on a large scale. It is clear from the experience of recent years that, in the distribution of essential commodities, unless efficient management, adequate training, careful selection of personnel, financial resources, and appropriate state policies are combined, the consumer's co-operative movement will not gain the strength needed to stand on its own. In a market economy, in which private industry already holds a high proportion of current resources and business, consumer co-operatives face an uphill task. While they can benefit from economic growth at the national and regional level and, in a measure, from public support, it is yet essential that they develop greater operational efficiency.

### VII. Co-operative Farming

India's Fourth Five Year Plan for the period 1969-74 has the following to say on co-operative farming in its chapter on Approach and Policy:

"Co-operative farming, on a voluntary basis, has been officially accepted as the way out (in tackling the problem of full and proper utilization of the land surface). However, so far no substantial progress has been made. Problems of motivation and organization met with in this approach have not yet been successfully solved on any significant scale. Moreover, it has not been sponsored actively enough by any large group or body of opinion within the country. Therefore, except for continuing the present schemes of encouragement of co-operative farming it has not been possible to propose any additional programmes in this plan."

This statement is a far cry from the views advanced in earlier Plans, and more specially in the Second Plan (1956-61) and in the Third Plan (1961-66). Whatever the hesitations in official policy at the present time, the inherent situation of the landless labourer, the tenant cultivator and the small and petty peasant can be expected to compel a measure of rethinking over the next few years in the approach to co-operative farming. Therefore, recognizing the practical lessons of implementation which have been learnt over the past 15 years and the pitfalls and limitations which doubtless abound, the earlier formulations of objectives and approach constitute a more dependable guide to public policy than those recently advanced or the apparent neglect of the role and significance of farm co-operatives in the current phase of development.

In earlier statements of policy, co-operative farming was looked upon as a major line of advance in the reconstruction of the rural economy, so that small peasants, landless agricultural labourers and those now

cultivating as tenants may find equal opportunity in an expanding and increasingly diversified economy. The goal accepted in the Second Plan and maintained in the Third Plan and reiterated somewhat less clearly in the Draft Outline for the period 1966-1971, which was presented in 1966, is that, over a period, a substantial proportion of the agricultural lands of India should come to be cultivated along co-operative lines. It was stressed, first, that measures of land reform and, in particular, the application of ceilings and the reduction of large disparities in the ownership of land would yield adequate benefits only if they were followed by greater co-operation in agricultural production. Secondly, while providing for aid and guidance from Government and institutional agencies, the growth of co-operative farming was visualized as a movement in the interest of the mass of the rural community, pursued mainly through their own leadership and voluntary effort. Thirdly, within the scheme of land reform, individual rights in land were to be fully assured and provided for in terms of an additional dividend over and above the income derived from work. It was realized that there are important technical and organizational problems and, to their solution as well as to the training of personnel, the utmost attention must be given. The emphasis, therefore, was on sound rather than on spectacular development.

However important its potential role, even under favourable conditions, co-operative farming is a difficult movement to succeed. Large and middle farmers are instinctively sceptical of its consequences and small peasants are also not easily convinced that the movement would be to their advantage. The existing balance of power in the rural community, which recent developments have tended to accentuate, runs strongly against the growth of co-operative farming. Case studies of co-operative farming experience undertaken over several years have brought out the fact that if co-operative farming societies are formed by groups of persons with a view mainly to receiving certain benefits or evading agrarian legislation, evil practices easily creep into them, and the genuine cause suffers grievously. Notwithstanding all the difficulties, the Committee of Direction on Co-operative Farming headed by D. R. Gadgil, which reported in September 1965, observed as follows: "Our survey and the case studies reveal notable progress in respect of some pilot as well as non-pilot societies and, at the same time, considerable failures. The areas of success have been those in which there was a conjuncture of favourable circumstances. It is obvious that having discovered these areas special attention must be paid to conservation of results achieved and utilization of the favourable climate for further planned progress. We have found that the crucial elements were non-official leadership, support of co-operative institutions and intelligent operation of governmental agencies."

Accordingly, the Committee made detailed recommendations, which need not be gone over here, but which cover questions as varied as the development of local leadership, size of farm, return for ownership and distribution of income, emphasis on employment and agro-industries, farm management practices, assistance from Government and co-operative institutions, land allotment policies, and the priorities and programme of work for the future. It is also unnecessary to consider, in the present context, the major areas of policy on which there is controversy and the critical issues on which clarity and a sense of direction are essential before much progress can be hoped for.\*

Some advance has been achieved in recent years, but much remains to be done, and it cannot yet be said that the support available from the Central and State Governments and the various executive and co-operative agencies is of a character calculated to lead to the fulfilment of the objectives laid down and accepted in the Second and Third Five Year Plans. Progress upto June 1969, is summarized in the following statistics:

Table VII

|                                          |    |         |
|------------------------------------------|----|---------|
| Number of co-operative farming societies | .. | 8,160   |
| Number of members                        | .. | 220,047 |
| Area (hectares)                          | .  | 420,783 |

### VIII. Other Co-operative Activities

Under the influence of general policies in support of co-operation, co-operative activities have expanded steadily into several new fields. This is not to suggest, however, that much more than a relatively small part of the potential of co-operation in the given conditions of India has yet been realized. In this section, we review briefly the growth of co-operation in industry, labour and construction, forestry, dairying, poultry, fisheries and housing

**Industrial Co-operatives:** Industrial co-operatives fall into two main categories: weavers' societies and other industrial societies. In June 1969, there were 12,566 primary weavers' societies, 106 Central societies and 23 apex societies. About one-half of the primary weavers' societies were dormant. The total value of cloth produced by weavers' societies in 1968-69 amounted to Rs. 456 million. Other industrial co-operatives included 20 State, 112 Central and 34,909 primary societies. Of primary societies, a little less than one-half were active. The total value

\*In this connection, attention is invited to the contributions to the F.A.O. Regional Seminar on Co-operative Farming for Asia and the Far East, New Delhi, May 2, 1966, published in the *Indian Co-operative Review*, Vol. III, No. 4, July 1966 and the writer's paper on *Approach to Co-operative Farming*, published in *Towards An Integrated Society* (Orient Longmans, 1969), pages 141-156.

of production in 1968-69 was Rs. 302 million. The Table below shows the distribution of these societies by industry:

Table VIII

Other Industrial Societies: Distribution by Industry, June 1969

| Industry                              | Number of<br>Primary societies |         | Number of<br>individual<br>members in<br>active societies | Paid-up<br>capital<br>(Rs. 000) |

In recent years there has been a measure of stagnation in the growth of primary industrial co-operatives of all types. Many of them have existed on sufferance or even nominally. Being among the weaker elements in the structure of different industries, whatever difficulties confront the latter have a harsh impact on industrial societies. Besides problems of finance, management and opportunity for productive business, these societies call for much greater attention from industrial administrations than they have received or are currently receiving, and their own organization at each level has been generally inadequate.

**Labour and Construction Co-operatives:** The role of labour and construction co-operatives in carrying out works in rural areas, in undertaking tasks now left to contractors, and in harnessing manpower resources, specially in the context of masses of landless labour and rural works programmes, has been emphasized in the Five Year Plans. Some measure of state support is assured but, in actual practice, it does not add up to a great deal, and as yet the necessary conditions of policy and organization remain to be established. At the end of 1968-69, there were 5,245 labour and construction societies, with 318,146 members, and works of the value of Rs. 112 million were executed during the year.

**Forest Co-operatives:** In areas inhabited by tribal communities, notably in the States of Maharashtra and Gujarat, as a matter of policy, considerable emphasis is now being given to the development of forest co-operatives. At the end of 1968-69, there were 1,584 forest co-operatives with about 141,848 members, and works of the value of about Rs. 52.4 million were executed by them during the year.

**Dairy, Poultry and Fisheries Co-operatives:** Urbanization and increase in urban demand for milk and milk products have provided a favourable economic setting for the growth of a dairying industry. In the supply zones of milk plants, it has been a natural development for farmers to organize themselves along co-operative lines. At the end of 1970, out of 106 dairy plants in operation in the country, 32 were already in the co-operative sector. Between 1960-61 and 1968-69, the number of primary milk co-operatives increased from 3,200 to 10,000, their membership and share capital increasing respectively from 233,000 to 773,000 and from Rs. 4.9 to Rs. 21.3 million.

Poultry co-operatives have also benefited from the growth of urban demand, but on a much smaller scale than dairy co-operatives. At the end of 1968-69, there were 883 poultry co-operatives with a membership of 42,913 and a total volume of business of Rs. 11.67 million.

Progress in fisheries co-operatives in recent years can be described as real, yet modest. In 1968-69, there were 3,994 fisheries co-operatives with 438,737 members—about a third of the fishermen in the country—and a share capital of about Rs. 15 million.

**Housing Co-operatives:** Urban growth and the extreme difficulty experienced by middle and lower middle income groups in obtaining building sites and finance in cities and towns have led to the development and even mushrooming of housing co-operatives. At the end of 1968-69, there were 18 State level and 15,029 primary housing co-operative societies.

Co-operative forms of organization are readily adopted in several other fields of activity, such as road transport, health, organization of activities such as those of taxi-cab owner-drivers, rickshaw pullers, washermen, etc. In these and other directions, co-operatives are making some headway. They certainly could achieve better results with sound management and greater supervision of their current operations.

### IX. Training and Administration

Since the Rural Credit Survey, much attention has been given to the intensive training of personnel serving co-operative departments and

co-operative institutions. In recent years, as co-operation has entered new and specialized fields and the federal approach to organization has been extended, the need for personnel trained in specific jobs has also greatly increased. For several years, training programmes in co-operation were planned and executed under the direction of an *ad hoc* high-level committee. This responsibility has passed to the National Co-operative Union which now runs an all-India institution, the Vaikunth Mehta National Institute of Co-operative Management for the training of senior officials. There are 13 training centres for intermediate personnel and 62 for junior personnel. There are also nearly 600 peripatetic units for training members and office-bearers of co-operative unions. At the end of 1970, the total number of senior officers trained to the time was reckoned at 1,676, of intermediate personnel at 11,786, and of junior co-operative personnel at 87,793. Each year, some 200,000 members and office-bearers of co-operatives are given training in the principles and practice of co-operation.

Though co-operative development accounts for only a small part of the total area of economic and social activity open to it, expansion from year to year even on the scale recorded in the preceding sections represents an enormous administrative challenge, which has yet to be met in any adequate degree. There has been significant expansion at various levels in the departments concerned as well as in the main co-operative agencies. There are acute problems of organization, efficiency, supervision and personnel which call for thorough and systematic consideration and much new thinking. An attempt was made to carry through such a review in the report of the Committee on Co-operative Administration under the chairmanship of Vaikunth L. Mehta in 1963, but too little has been done since to follow through with the recommendations made. Among administrative problems which have assumed increasing importance, as co-operative activities have expanded, are the role and organization of co-operation as a voluntary movement, relations between co-operative organizations and Government agencies, management of co-operative enterprises, protection of the public interest, promotion of co-operation in the interests of the weaker sections of the community, and prevention of forms of exploitation which can and do arise frequently in the name of co-operation and in total contradiction to its spirit and objectives. These and other matters of organization, direction of policy and public education and support have great urgency and seriousness. At the end of a period of wide-ranging advance, mixed and uneven though this has been, these problems and their ramifications leave cause for genuine concern.

## B. COMMUNITY DEVELOPMENT

### I. Purpose and Method

The choice of community development as the spearhead of work in the rural areas and other developments which have ensued from this decision, which was made as far back as 1952, should be understood as against certain perspective. As stated in the Introduction, the idea existed in several incipient forms many years before independence, and some pioneer experiments had been undertaken. The emphasis was then on the individual, on the human approach, and the focus was on the village. At this stage, agriculture had not yet emerged in the general thinking of the country as the crucial sector of economic development. In a small way, various agencies of Government were attempting to carry their modest programmes of work and technical advice to the rural areas, each barely able to scratch the surface and baffled by the enormous size of the task. There was little to unify and provide direction to the diverse activities in which different agencies were engaged. The nature of economic and social development, seen either as a process or as a goal, was but dimly understood; the time was not yet ripe for it.

In the early fifties, a combination of circumstances arose which made community development a necessary and logical course to follow. There was, first, the commitment to an overall national plan which would cover all aspects of social and economic life. In the setting up of a genuine democracy, with the support and participation of the people, the aim was to rebuild the economy of India and reshape and modernize her social institutions and attitudes. Secondly, there was the concern, which Gandhiji had expressed continuously in his life and work, with the problems of poverty in the villages. The peasant's life was one organic whole. It was not segmented in the manner of departments and activities of Government. The man and the community were but two sides of the same question; neither could advance without the other. The community comprised not only those who had land, much or little, but also those who cultivated as tenants or worked as labourers and artisans, and others in the village. The method of development to be followed should provide for them all, not merely for some, leaving others to their fate. The shortage of food and raw materials, following the war and partition, was a cause of imbalance, hardship and inflation, and had to be overcome as swiftly as possible. The technological imperatives of agriculture at this stage were not seen as fully as they came to be in later years, but V. T. Krishnamachari's own experience in Baroda had emphasized the value of rural extension, an impression

reinforced from what was then known in India about the changes brought through the work of extension services in the United States. The work of Albert Mayer and his associates at Etawah in Uttar Pradesh had drawn pointed attention to the practical value of 'development blocks' as suitable areas of action and to the role of multi-purpose village level workers in working with the people, helping to change attitudes and stimulate self-help on the part of local communities. The Grow More Food Committee and, earlier, the Fiscal Commission, both headed by V. T. Krishnamachari, gave him an opportunity to stress the fact that the administration at the district level had to be transformed into an agency for welfare and development and that, through the provision of extension and other services, the people had to be given the means and the capacity to expand production and, increasingly, to provide for themselves the amenities and other conditions for economic and social progress. Other circumstances aided the process, for instance, the interest of the Ford Foundation in rural extension projects and the conclusion of an agreement with the United States for technical co-operation in community projects.

Through 1952-53, as work in the first fifty project areas was being taken in hand, the concept of community development as a programme of development to be carried out on a nation-wide scale took fuller shape. Some cautioned against the pace. There were inconsistencies which were not reconciled as, for instance, the distinction made in the early years between the idea of a 'national extension service', with emphasis on agriculture and small outlays for other activities, and 'community development' which was thought to be more varied in its impact and would cost more. Soon, also, it came to be seen that there were severe limits to what even devoted extension officials could hope to achieve unless the people were motivated, responsibility placed on them, and resources of leadership and initiative within the rural community brought into play. Nevertheless, important decisions had been taken and action in the villages was under way and, with pardonable pride, Jawaharlal Nehru, who was himself so much the inspiration of this tremendous adventure, spoke of community projects as 'centres of human activity which are like lamps spreading their light more and more in the surrounding darkness'. "This light has to grow" he said, "till it covers the land". Community programmes were at least a vital part of the answer to the question, as he put it many years later, 'how is one to draw the 80 per cent people in rural India out of their ancient ways and habits and their methods of thinking'?

After experience had been gained for a period of three to four years, early in 1956, the Committee on Plan Projects, which had then been constituted under the aegis of the National Development Council, set up a Study Team to consider certain questions relating to the execution

of the community development programme, including co-ordination, personnel, peoples' initiative and participation and methods of reporting. Later, proposals for introducing democratic processes and representation at the block and district levels, which had been broadly outlined in the Second Five Year Plan, were also referred to this body for detailed consideration. The work of the Study Team, which was headed by Balwant Rai Mehta, had two important results. First, it removed the contradiction mentioned earlier between community development and the extension service and gave a unified conception to the programme. In each development block, the programme was to pass through two stages, each of five years, a larger outlay being provided for in the first stage than in the second. From this scheme emerged the notion of a 'pre-extension' and a 'post-extension' period. The block was to be the unit of development, so that the idea of a 'block plan' within the framework of a 'district plan' and comprehending 'village plan', was seen as a natural evolution. The second and, on a long view, the more fundamental contribution of the Study Team was to give shape to the idea of democratic decentralization or local democracy, to which Jawaharlal Nehru, who was greatly drawn to the values implicit in it, gave the name of Panchayati Raj. By Panchayati Raj is meant a network of civic institutions at the village, block and district levels to which responsibility for development is decentralized by the State Governments, accompanied by appropriate resources and delegations of power.

The proposals of the Study Team on the organization of the community development programme were accepted and given effect to. However, as the end of the ten-year period envisaged at the time drew near in many areas, it began to be realized that rural development was a more long-drawn and complex process and new decisions would be needed. The proposals on Panchayati Raj were also accepted in principle and it was left to each State to enact the necessary legislation after determining whether the main point of decentralization should be the district or the block. Whatever the decision, it was important to stress the key role of Panchayats at the village level, and to ensure that democratic institutions at various levels were linked together into an organic structure and were provided with the necessary administrative and organizational support. It was also visualized that voluntary organizations and the co-operative movement would be conceived of as part of rather than as mere adjuncts to Panchayati Raj.

## II. Programmes and Progress

For carrying out the national programme of community development, the country was delimited into 5,265 development blocks. At the end

of September 1969, 2,071 blocks had completed twelve years of developmental work and had entered the 'post-extension' period, 2,496 were in the second stage, and 693 were in their first five-year period. The coverage of community development activities expanded as shown below:

Table IX

|                                 | Upto<br>1955-56<br>(First Plan) | Upto<br>1960-61<br>(Second Plan) | Upto<br>1965-66<br>(Third Plan) | 1969-70 |
|---------------------------------|---------------------------------|----------------------------------|---------------------------------|---------|
| A. 1. Number of blocks allotted | 1,075                           | 3,137                            | 5,242                           | 5,265   |
| 2. Population (millions)        | 69                              | 203                              | 404                             | 405     |
| 3. Number of villages (000)     | 143                             | 364                              | 565                             | 567     |
| B. Number of blocks in          |                                 |                                  |                                 |         |
| (a) Pre-extension stage         | —                               | 490                              | 17                              | —       |
| (b) Stage I                     | 1,075                           | 2,258                            | 2,315                           | 495     |
| (c) Stage II                    | —                               | 879                              | 2,168                           | 2,422   |
| (d) Post-Stage II               | —                               | —                                | 760                             | 2,348   |
| Total:                          | 1,075                           | 3,627                            | 5,260                           | 5,265   |

The nucleus block budget was placed at Rs. 1.2 million for the first five years and at Rs. 0.5 million for the second period of five years. These amounts were to be supplemented for specific programmes of development from provisions made in different sectors of the Five Year Plan, the block and the block organization being viewed as vehicles for transmitting resources, technical advice and impulses for action at the area level. For tribal development blocks, additional provisions to the extent of Rs. 1 million in the first stage and Rs. 0.5 million in the second were to be made from the appropriate sectoral allotments. The total expenditure on the community development programme over the fifteen year period covered by the first three Plans has been of the order of Rs. 5,000 million—Rs. 460 million upto 1955-56, Rs. 1,870 million between 1956-57 and 1960-61, and Rs. 2,670 million between 1961-62 and 1965-66. Roughly, a third of the expenditure was accounted for by establishment (including buildings for the development block), another one third by agriculture and the remaining by other activities. Expenditure on community development between 1966-67 and 1970-71 was estimated at Rs. 1,400 million.

Community development provided the pattern and organization of rural administration at the base. In doing so, it furnished a means for implementing programmes in different spheres with a degree of co-ordination in relation to one another and facilitated expansion in a number of fields *pari passu* with increase in the number covered by

community development blocks. This was especially the case in agriculture, health and education. The entire programme for rural health services was based on primary health centres, which were established in line with the opening up of new community development blocks. Whatever might be said of the adequacy of personnel at the block and village levels and whatever improvements in training and in the quality of extension personnel were felt to be necessary in later years, it still remained a fact that, but for the structure of community development, the foundations for implementing vast programmes of development in different sectors could not have been secured without having to incur much larger expenditures and employing much bigger staffs. All organization and development involve in some measure the creation of bureaucracies. Even recognizing that community programmes should have put greater emphasis on efficiency in agricultural extension and other specialized services, with all its limitations, this national programme made possible a scale and pattern of effective rural action such as would have been most difficult to achieve in any other way.

In the first decade of community development, the emphasis on training of personnel and the attention given to techniques of extension served as a valuable example for action in other fields as well. In March 1970, extension staffs in the blocks included 58,875 village level workers, 4,197 block development officers, 6,464 extension officers in agriculture, 4,520 in co-operation, 3,959 in animal husbandry, and 5,783 in social education and Panchayat work. There were also 3,146 medical officers, 3,143 progress assistants, 4,384 overseers, 1,818 *mukhya sevikas*, and 6,087 *gram sevikas*. Much can be said on inadequacies in the quality of various categories of personnel in the blocks but, given the effort, these deficiencies are capable of being removed. Far more important is the fact that a considerable organization was built up over the years, that vast numbers were put through various courses of training, and that the central purpose of community development was seen as service to the rural people and the creation in each area of capacity, on the part of the people, to plan for themselves, to throw up new leadership, and to participate intensively in development and in the processes of civic administration at various levels.

Three important illustrations of the interaction of community development with national schemes of significance, which were taken up in later years, are the programmes for family planning, for applied nutrition, and for rural works. These involved extensive and widespread action at the community and area level, and it was natural that they should be enmeshed with community development. Programmes for co-operative development also fell within the general pattern. Certain difficulties were, however, experienced in relation to specific agricultural programmes. These were of two kinds. First, of all the agencies

operating in the rural areas, the agriculture departments were somewhat better equipped in personnel than others. The idea of an integrated administration at the block level with village level workers performing functions wider than those of agriculture alone raised certain apprehensions bearing on control, performance and organization, and from time to time even evoked negative reactions from agricultural personnel at the higher levels. Secondly, the fact that progress in agriculture did not measure upto expectations and fell short of the needs of the country and that the quality of extension services, of the research which supported them and the inputs and supplies available were less than adequate, raised from time to time serious doubt concerning the role of community development in relation to rapid agricultural development. Some important lessons have been learnt in recent years and the gaps both on the side of community development and agricultural development are now better understood and are being filled. The character of the agricultural problem and the nature of the contribution which rural administrations at the area level have to make have both changed. There is need for greater intensification and specialization and for improvement in the quality of rural services and in the range of supplies and inputs to be brought to the farmer. It is being realized that, along with the farmers, who must receive better service, there is also a great deal to be done constantly and continuously in the interest of the weaker and the vulnerable sections of the rural community. In June 1968, a conference of Chief Ministers reviewed the state of community development, took note of recent developments, several of which had tended to weaken the movement, and once again affirmed the necessity of an integrated community approach to rural problems, supported by efficient administration in agriculture and a growing and broad-based co-operative movement.

### III. Panchayati Raj

A few words may be added here about Panchayati Raj or the movement for local democracy. As explained earlier, this movement grew out of community development with the object of giving opportunities to the local community to shape its own future, to throw up new leadership, and accept increasing responsibility for its own welfare. Had the links and the sequence of events not been what they were, local democratic institutions would still have been found necessary and would have come about in some other way, possibly as a measure of administrative and political change and as a result of popular pressure. In this sense perhaps Panchayati Raj came sooner than the country was prepared for it. In the recent past, the pace of progress in the development of local democracy has been slower than had been hoped for, and it has become even

more important to view Panchayati Raj as an independent national goal and a movement to be fostered rather than merely as a set of institutions which are a by-product of the administration of community development and other rural programmes.

The main facts concerning the development of Panchayati Raj can be briefly stated. Panchayats at the village level exist throughout the country. They constitute the foundation of the entire system and need to be utilized far more purposefully as instruments of village planning and village development than has happened thus far. In the absence of such effort and of greater emphasis on the role of the *Gram Sabha* or the village assembly, panchayats readily become centres of factional activities and provide scope for misuse of power, and even the meagre resources available to them can be misapplied. In 1970, there were 214,967 village panchayats, 3,297 panchayat bodies at the block level, and 254 district level panchayats, commonly known as *Zila Parishads*. Between 1959 and 1963, 13 States enacted legislation for Panchayati Raj; of these, 11 have sought to give effect to it, though with varying degrees of emphasis on effective decentralization and local planning. In recent years, the movement for democratic decentralization has suffered a setback, and various economic and political factors have worked against the development of the institutions of rural democracy at the base. In several States, there has been insufficient recognition of the constructive possibilities of Panchayati Raj institutions. Where the necessary institutions already exist, need is felt for more unified guidance from the administrations at the State level, which tend to function along departmental lines. Much also remains to be done by way of administrative and financial delegations and improvements in procedures. To enlarge the scope for constructive action on the part of Panchayati Raj institutions, it is necessary to move as quickly as possible, on the one hand, in the direction of intensive area development, with particular attention to agriculture, employment, education and family planning, and, on the other, in the direction of integrated rural and urban development, involving close co-operation between and dovetailing of Plans between rural and urban institutions.

#### IV. Unifying Ideas

In conclusion, it may be stated that three basic ideas are common to the movements for co-operation, community development and Panchayati Raj. These are: self-help, self-reliance and the harnessing of local resources and leadership; responsibility on the part of each community and each area for planning its own welfare and development; and continuous partnership in development between the administration and the people. These ideas are vital for any multi-party social demo-

cracy which is committed to human and moral considerations, but they do not stand alone. They gain their true function and significance only in the context of national planning and of social and economic policies conceived in the interest of the community as a whole and, more specially, in the interest of those who have remained poor and weak and backward. Without this wider social perspective, all too soon, the institutions of Co-operation, Community Development and Panchayati Raj can miss their purpose, as indeed they have already done from time to time in different parts of the country. Therefore, on the part of all citizen-leaders and the community generally, there is need for the utmost care and vigilance both in respect of the means they employ and the ends they serve.\*

## **CHAPTER VI**

# **AGRICULTURE AND ALLIED INDUSTRIES**

### **I. Agriculture in the National Economy**

India is primarily an agricultural country and the agricultural sector is the mainstay of the national economy accounting for almost half of its national income and three-quarters of its working force. Agricultural commodities comprise almost 80 per cent of the total consumer expenditure. Fluctuations, in agricultural output levels, therefore, play a key role in the state of the national economy. Prices of consumer goods as also the general price level fluctuate with the rise and fall in agricultural prices. Price variations influence, in turn, the wage levels. The purchasing power of the vast majority of the people in India is thus inextricably linked up with the fluctuating fortunes of agriculture.

In the sphere of international trade also agriculture has the place of pride. The main agricultural commodities which are exported are tea, oilcakes, fruits and vegetables, spices, tobacco (raw and manufactured), cotton (raw and waste), coffee, cocoa, sugar and sugar products, hides and skins, raw wool and other varieties of animal hair and vegetable oils. Cotton and jute textiles, which are important commodities, also depend for their raw material on agriculture. The share of agricultural commodities in the import trade has varied from 38.6 per cent in 1960-61 to 51.1 per cent in 1967-68 ; import commodities being cereals and cereal preparations, raw cotton, fruits and vegetables, fertilizers (crude and manufactured), vegetable oils and fats, dairy products, raw jute, tractors, raw wool, rubber and agricultural machinery and implements. Efforts are being made to reach self-sufficiency in agricultural commodities, specially foodgrains, raw cotton and jute.

Economic regeneration is being attempted over a succession of Five Year Plans. The tempo of industrialization is being built up and agricultural output has to grow so as to meet the raw material requirements of various agro-based industries as also to provide not only better nutritional standards, but also to meet the demand for various food items at improved levels of income. It has been the experience the world over that in predominantly agricultural

economies, agriculture has to serve as the base for capital formation in the earlier stages of economic development.

After two successive years of drought marked by uncertainty of food imports and a rather steep upward swing in prices, the last two years, 1969-70 and 1970-71, have produced an all time record production of foodgrains. Self-sufficiency in food for which the country had been striving hard over the successive Five Year Plans seems to be in sight for the first time and the Government has announced its policy of stopping all imports after 1971.

**Occupational Pattern :** Agricultural classes consisting of cultivators (78.7 million) and agricultural labourers (47.3 million) formed about 70 per cent of the total workers of 126 million in 1971. Dependence on agriculture was more marked in the rural sector constituting about 80 per cent of the total population. A look at the census data will reveal that urban population as a proportion of the total has remained more or less constant during the last several years. This constituted 17.3 and 18.2 per cent of the total population according to 1951 and 1961 Census respectively. The agricultural sector thus continues to absorb a major proportion of the increase in the total working force.

**National Income :** Distribution of national income by industrial origin for the period 1950-51 to 1969-70 (the latest year for which such estimates are available) shows that the share of various agricultural commodities, animal husbandry, and ancillary activities has ranged from 45 to over 50 per cent at current prices during this period. The contribution of forestry and fisheries to the national output was not very significant, having ranged between 0.7 to 0.8 per cent in the case of forestry and 0.4 to 0.7 per cent in the case of fisheries (Table I).

Sectoral importance of various products which constitute this broad sector can be examined from the available data. The gross value of output from agriculture, animal husbandry, and ancillary activities was Rs. 156.1 billion during 1969-70 at current prices. Of this, the share of animal husbandry comes to over 20 per cent. Within agriculture, foodgrains (including cereals, pulses, and gram) generally account for nearly 50 per cent of the total. Taking into account all the major cash crops, i.e. oilseeds, sugarcane, fibres, tea, tobacco, chillies, and fodder, the gross value of non-food crops including straw accounts for nearly 25 per cent of the gross cropped area.

Statistics of output as well as value of these non-food crops are rather scanty. The position is no better in respect of animal husbandry, fisheries, and forestry. With improvement in the statistics in respect of these products, it is quite likely that the real contribution

of agriculture and its allied sectors might be discovered to be more than the one depicted by the incomplete data.

**Foreign Trade :** Commodity-wise contribution of the various agricultural commodities to the import and export trade of the country for the last five years are presented in Tables II and III. The quantum of gap in a particular year is very much influenced by the production level attained both in regard to imports and exports. Apart from the levels of agricultural production, there are many other internal and external factors which exercise an influence on the magnitude of these trade flows. External factors may be those relating to the price and production situation in the country from which our imports originate or those to which our exports are destined. The importing countries have also an influence on the magnitude of our export trade flows. Important internal factors which have a bearing on the pattern of export trade in agricultural commodities are: (i) export policy regulations and control measures; (ii) trade agreements with the various countries in regard to agricultural commodities; (iii) development of trade institutions and organizations like UNCTAD and GATT; and (iv) the internal demand and the export surplus.

On the importing side, the exigencies of foreign exchange situation are of paramount importance and the import policy has necessarily to be of a restrictive nature. Import policy has to be shaped with an eye on ensuring an even flow of the availability of essential requirements of the economy in general and of the export and defence oriented industries in particular. In the agricultural sector, there is need for import of (a) foodgrains, to meet the gap between the total internal demand and supply till we have reached the level of self-sufficiency; (b) fertilizers and other inputs of industrial origin which cannot be indigenously produced; and (c) essential raw materials not indigenously produced for the running of certain agro-based industries more important of which are jute and cotton textiles. What is important in the overall context is the import bill for cereals and cereal preparations. They accounted for 15 to 17 per cent of the total imports in years of normal production. In bad years, however, when production fell due to vagaries of weather, this increased to over 25 per cent.

A study of the export possibilities in a long range perspective would indicate that the importance of these agricultural products is not likely to decline. As far as one can foresee, foreign exchange earnings of the country will continue to be derived to a large extent from these agricultural raw materials. On the import side, the possibility of eliminating imports of certain other agricultural raw

TABLE II

| 14. Fish and Fish<br>preparations                   | 7.3<br>(0.7)       | 18.4<br>(1.5)      | 22.7<br>(1.7)      | 31.5<br>(2.2)      | 30.5<br>(2.0)      |
| 15. Vegetable Oils (essential and<br>non-essential) | 19.9<br>(1.9)      | 7.7<br>(0.6)       | 16.1<br>(1.9)      | 9.3<br>(0.7)       | 9.7<br>(0.6)       |
| Total Value of Exports                              | 1,099.8<br>(100.0) | 1,198.7<br>(100.0) | 1,357.8<br>(100.0) | 1,413.3<br>(100.0) | 1,524.4<br>(100.0) |

materials like superior varieties of cotton, jute, etc., during the next few years cannot be visualized. A situation of nearly overall self-sufficiency in the matter of foodgrains is, however, contemplated in near future when all concessional imports may be stopped.

**Consumption Expenditure:** Reports of various rounds of National Sample Survey give useful data on consumption expenditure. Generally speaking, as much as 63 per cent of the total expenditure is incurred on food, with foodgrains accounting for nearly 37 per cent. Another 16 per cent of the consumer expenditure is incurred on items like textiles, foot-wear, fuel, and household equipment all of which are mostly of agricultural origin. This aggregates to 79 per cent of the total consumer expenditure. As the achievement of certain nutritional norms is an essential feature of plan formulations, percentage share of food items in the total expenditure is likely to remain at the present levels, at least for some time to come, although the importance of cereals will slowly go down and other foods rich in protein will be consumed more and more.

## II. Environmental Factors

Agriculture depends on nature. Recent advances in science and technology have helped to reduce dependence on nature. But handicaps placed by nature can be overcome only at a cost. Thus, an appraisal of environmental factors is essential both for assessment of agricultural potential and for deciding on efficient land use patterns and management techniques in order to obtain maximum possible agricultural output.

Several environmental conditions affect crop production. Attention has been focussed here on two of them which are of crucial importance, viz., soil and climate. An attempt is made to highlight those features of Indian soils and climate which have an important bearing on agriculture.

**Soils:** Systematic soil surveys and soil testing is a relatively recent development in India. District Gazetteers and Revenue Settlement Reports compiled during the British regime contain a good deal of useful information on soils. But most of it is based on personal observations and experience—albeit of very shrewd and perceptive revenue officers. The first attempt to classify Indian soils on the basis of parental rock materials was made by Leathers in 1898. His four-fold grouping of Indian soils has formed the traditional classification. A good account of traditional classification of Indian soils is to be found in the Report of the Royal Commission on Agriculture in India, 1928. The traditional classification of Indian soils into four major types—*alluvial*, *Regur* (black cotton soil), *red*

and laterite—has been followed in all standard works on Indian geography.

Soil survey work during pre-1928 period suffered from absence of a co-ordinated all-India approach. General soil studies were made with regard to their contents of plant nutrients and mechanical analysis of their composition which yielded useful agronomic information. But these studies pertained to very small areas and were of isolated character. One of the grievous defects of such isolated studies was that no standard and uniform methods of sampling and analysis were followed. All such studies, though useful in themselves, were of little help in the work of detailed soil mapping for the country.

The Royal Commission on Agriculture, 1928, recognized the importance of systematic soil survey work. It recommended soil surveys for specific purposes and emphasized the need for "intensive studies of the more important types of soil" and for "collection and publication of all the information in regard to the composition and characteristics of Indian soils which is available."

Extensive soil surveys were initiated in the Punjab in 1928. Soil survey work was extended gradually to other areas in the subsequent period. The Indian (then Imperial) Council of Agricultural Research sponsored the scheme for collection, critical examination and collation of the information collected. The Report which was completed in 1946 contains all information on soils and crops available in the country upto 1945. This report was published in 1953.

Emphasis on planned agricultural development since independence has brought to light the imperative necessity of soil surveys and soil testing. An All-India Soil Survey Scheme was started in 1956, primarily for conducting reconnaissance soil surveys. This Scheme was later integrated with the Land Use Planning Scheme of the Central Soil Conservation Board and is now known as All-India Soil and Land Use Survey Scheme. Extensive field-work has been done to fill up the gaps in the existing knowledge regarding soils. Information collected upto the year 1960 was brought together in a comprehensive volume and published by the Indian Council of Agricultural Research towards the end of 1963. It contains soil maps for all-India and State-wise. It gives a comprehensive account of soil surveys and soil information for each of the States and Union Territories. Among several aspects covered for each State are : geology, climate, vegetation, irrigation, soil fertility, soil characteristics like physical, chemical and physico-chemical properties. State-wise details are given regarding formation, structure, genesis, profile;

p.H values, and classification of soils, and also methods of their reclamation and management.

Despite extensive soil survey and soil testing work in India since independence, soil mapping and correlation has not yet proceeded very much beyond delineation of the broad pattern of soil orders and sub-orders largely related to macro-regional and regional characteristics pertaining to climate and vegetation, slope and regolith (Table IV).

There are four major groups of soils in India :

- (i) Alluvial
- (ii) Black
- (iii) Red
- (iv) Laterite and Lateritic

**Alluvial Soils :** These soils constitute by far the largest group of soils in India, covering nearly 15 lakh km. They are derived from silt deposited by the numerous rivers throughout the length and breadth of the country, from deltaic alluvium, and from coastal alluvium. They are found mainly in the states of the Punjab, Rajasthan, Uttar Pradesh, Bihar, West Bengal and parts of Assam and Orissa. They also occur in the valleys of Brahmaputra and Surma in Assam, of Narbada and Tapti in Madhya Pradesh, and of Godavari, Krishna and Kaveri in South India. Geologically, alluvial soils may be divided into two broad sub-divisions, viz., older and newer alluvium. The older alluvium, locally known as *Bhangar*, is in the process of denudation. The recent alluvium locally known as *Khadar*, is in the process of building up. Alluvial soils differ widely in texture and consistency, ranging from sands through loams fine silt and heavy clay. Older alluvium is of more clayey composition, generally dark coloured and full of lime nodules, called *Kankar*. Newer alluvium, on the other hand, is sandy, generally light coloured and of less *Kankar* composition.

Alluvial soils exhibit wide spread deficiencies of plant nutrients and suffer from general physical defects. Marked deficiency of nitrogen and humus is caused by the fact that high temperature leads to quick decomposition of organic matter. Most of the phosphorus found in these soils is present in inorganic forms, especially calcium phosphates. This difficulty is further accentuated in case of calcareous soils because their calcareous nature hastens the conversion of applied phosphates also into more insoluble forms of calcium phosphates. The total amount of potash in these soils is generally adequate but there are indications of frequently high fixation of it. Thus balanced use of NPK is considered desirable for obtaining high yields of crops on these soils. This is corroborated by information

## Extent of area of the soil groups of India

TABLE IV

| Sl.<br>No. | Soil groups                                                                                  | Area              |                  |
|------------|----------------------------------------------------------------------------------------------|-------------------|------------------|
|            |                                                                                              | Sq.<br>kilometres | Million<br>acres |
| 1&2        | Alluvial soil, riverine, old and recent; non-saline, non-calcareous to moderately calcareous | 1,012,000         | 200.00           |
| 3.         | Alluvial soil, riverine, highly calcareous                                                   | 89,000            | 22.00            |
| 4.         | Soil developed on coastal alluvium, occasionally saline                                      | 85,000            | 21.00            |
| 5.         | Soil developed on deltaic alluvium, occasionally saline                                      | 180,000           | 44.48            |
| 6.         | Alluvial soil, riverine, affected by salinity and alkalinity                                 | 68,000            | 16.80            |
| 7.         | Pedocal sierozem of alluvial origin                                                          | 40,500            | 10.00            |
| 8.         | Pedocal brown and soil of alluvial origin                                                    | 34,000            | 8.48             |
| 9.         | Grey brown (Desert) soil                                                                     | 36,400            | 9.00             |
| 10.        | Desert soil                                                                                  | 106,000           | 26.19            |
| 11.        | Deep black soil                                                                              | 68,800            | 17.01            |
| 12.        | Medium black soil                                                                            | 214,500           | 53.00            |
| 13.        | Shallow black soil                                                                           | 58,500            | 14.46            |
| 14.        | Black soil affected by salinity and alkalinity                                               | 69,000            | 17.05            |
| 15.        | Black soil undifferentiated                                                                  | 135,000           | 33.36            |
| 16.        | Mixed black and red soil                                                                     | 115,000           | 28.42            |
| 17.        | Ferruginous red soil                                                                         | 90,800            | 22.44            |
| 18.        | Ferruginous red and gravelly soil                                                            | 60,500            | 14.05            |
| 19.        | Red and yellow soil                                                                          | 198,000           | 48.93            |
| 20.        | Laterite                                                                                     | 128,000           | 31.63            |
| 21.        | Laterite and lateritic soil                                                                  | 120,200           | 29.71            |
| 22.        | Brown soil (under deciduous forest)                                                          | 26,200            | 6.48             |
| 23.        | Forest soil                                                                                  | 164,700           | 40.71            |
| 24.        | Podsollic soil                                                                               | 36,400            | 9.00             |
| 25.        | Foot-hill/Teral soil                                                                         | 46,600            | 14.00            |
| 26.        | Mountain and hill soil                                                                       | 13,300*           | 3.29*            |
| 27.        | Mountain meadow soil                                                                         | 11,700            | 2.89             |

\*Including Sikkim and Bhutan.

relating to responsiveness of yield to applications of fertilizers available from experiments conducted on farmers' fields.

Deficiencies of micro-nutrients have also been observed. The sandy soils of this group are reported to be deficient in sulphur. Deficiencies of zinc, iron and manganese are not uncommon. Besides, it is felt that boron may be present in toxic amounts, particularly, in saline-alkali soils of this group. Deficiencies of micro-nutrients may become more marked with the increases in yields resulting from the extended use of high-yielding varieties and greater application of water and NPK.

Some of the soils in this group show certain defects with regard to their physical properties. There is occurrence of hard pan, clay pan and caliche pan which impede penetration of plant roots and percolation of water. High bulk density has adverse effect on yields in some of the areas like the serozem belt of the alluvial soils of the Punjab, Rajasthan and Gujarat, which grow much of American cotton. Fairly extensive areas are affected by problems of water logging and salinity and alkalinity.

**Black Soils :** This is the second largest group of soils, covering an area of about 5.5 lakh km. These soils have developed over the lava deposits of Deccan trap and are locally known as *Regur*. The black soils are derived from two types of rocks, the Deccan and the Rajmahal trap ferruginous gneiss and schists occurring in the state of Tamil Nadu under semi-arid conditions. This group of soils is found in central and western Madhya Pradesh, southern Orissa, southern and coastal Andhra Pradesh, northern Karnataka and almost the whole of Maharashtra. They also occur in parts of Gujarat, Rajasthan, Uttar Pradesh and Tamil Nadu.

The black soils have predominantly clayey character. They are highly sticky in character, with better moisture retaining capacity. They are difficult to plough when wet because of stickiness. The presence of montmorillonite type of clay minerals imparts the property of high expansion and shrinkage to these soils. They crack during hot dry weather and are thus "self-ploughing". These soils are generally rich in potash, iron, lime, etc., but deficient in nitrogen, phosphoric acid and organic matter. Deficiency of zinc is also observed. A major problem with these soils is their bad structure. They have to be worked at the proper moisture level. Otherwise, their structure is spoilt. Some of these soils also suffer from salinity and alkalinity and present drainage difficulties. These soils are locally known as *Chopan*.

**Red Soils :** These soils cover an area of about 3.5 lakh km. They have developed from the weathering of the ancient crystalline metamorphic rocks. They consist largely of granites,

gneisses and schists with subordinate rocks rich in ferro-magnesium minerals. These soils occur in large parts of Tamil Nadu, Karnataka, north-east Andhra Pradesh, south-east Maharashtra, Madhya Pradesh, Orissa and Chota Nagpur. They are also found in the Santhal Parganas of Bihar, certain districts of West Bengal, Uttar Pradesh and Rajasthan, and Khasi, Jaintia, Garo and Naga Hills of Assam.

Texturally, red soils are sandy to loamy and even gravelly on the upper slopes of the river valleys. They are generally porous with lesser moisture retaining capacity. There is absence of lime *Kankar* and free carbonates. Soluble salts are present in a small quantity. The reaction is neutral to acidic. These soils differ greatly in depth and fertility. There is general deficiency of nitrogen humus, phosphoric acid and lime. The predominance of kaolinitic clay minerals leads to high phosphate fixation.

**Laterite and Lateritic Soils :** These soils are peculiar to India and other countries with tropical climate characterized by high temperature and high rainfall with alternating wet and dry periods. Some recent writers would confine the term laterite to an already hardened, perhaps fossil, layer but laterite crust is not necessarily the end product of soil evolution as implied in many studies. To avoid confusion caused by different meanings attached to this term, Bunting suggested "perhaps it would be best to abandon the term laterite for a native term such as *Murram* or *Khoai* (West Bengal) and *Bowal* (Guinea)". In India also the use of the term laterite does not conform to standard terminology; and the term lateritic has been used as a hedge to include soils about which precise knowledge was lacking.

Laterite and lateritic soils cover an area of about 2.5 lakh km. Lateritic soils are specially well developed on the hill tops of the Deccan, Karnataka, Kerala, Madhya Pradesh, the Eastern Ghats of Orissa, Maharashtra, Malabar and parts of Assam. In Tamil Nadu, there are both high level and low level lateritics which are formed from a variety of rocks.

Laterite soils are characterized by the presence of a compact to vesicular mass in the sub-soil horizons, composed essentially of a mixture of hydrated oxides of iron and aluminium. There is separation of iron oxide in the form of nodules, and the gradual cementation of the latter to form an indurated honeycombed mass.

The texture of the soils in this group ranges from heavy loams to clay. These soils are usually deficient in nitrogen, phosphoric acid, potash, lime and magnesium. Although they are low in fertility, there is good response to manuring and soil management. Valley soils can yield good crops of rice and sugarcane.

**5. Other Soils :** Four more soil groups can be distinguished among the remaining soils in the country. Largest among them are forest soils covering an area of about 2.9 lakh km. These soils are characterized by the deposition of the organic matter derived from forest growth. These soils are found in Himachal Pradesh, sub-Himalayan tract of Uttar Pradesh, hilly districts of Assam, Darjeeling district, Coorg and Malabar district. Second important soil group consists of desert soils covering an area of about 1.4 lakh km. distributed over arid and semi-arid region of the Punjab and Rajasthan. These tracts are covered by a mantle of blown sand which impedes soils development. The third group of saline and alkali soils is the result of concentration of salts owing chiefly to lack of underground drainage. Capillarity action during summer brings them to the surface where they form a white efflorescent crust. These soils are known under various local names, viz., *Reh*, *Kallar* and *Usar*. Large areas of land in the Punjab, Uttar Pradesh, Maharashtra and Gujarat have been rendered infertile by saline and alkaline effervescences. The fourth group of soils comprises peaty and other organic soils. Typical peaty saline soil is found in Kuttanad in Kerala, where it is known under the local name of *Kari* and cover an area of about 150 km.

**Climatic Conditions :** India is characterized by essentially a tropical climate. Although the northern part of India falls into the subtropical zone, it is protected from cold winter winds by the great mountain wall of the Himalaya. Monsoons impart a distinctive character to India's climate. The effects of temperature and rainfall conditions on agriculture are discussed below:

**Temperature :** High temperature has adverse effects on the humus content of soils. High temperatures also increase water losses of soils. Besides, warm and humid weather stimulates the growth of weeds which compete with crop nutrients and pests that thrive on plant life. Otherwise temperature is not considered to be a serious limitation on growth of plants in India. Sunlight is adequate for the efficient growth of crops. Sunny days are generally sufficient and quite evenly spread over the year in different parts of the country. The length of the growing season presents no problem in most parts of the country. This is a very great natural advantage as compared to the countries with temperate climate.

**Rainfall :** India's major handicap is rainfall. High temperature increases loss of water through evaporation and transpiration. Actual rainfall is thus rendered inadequate over vast regions. Besides, rainfall is unevenly spread over the year. The erratic nature of monsoons leads to the spectres of famines and floods. In the absence of data on losses of moisture through evaporation and

transpiration, it is not possible to map out precisely areas of deficient rainfall. But a rough estimate is as follow :

|                                                  | <i>Net area sown</i><br>(Thousand hectares) |
|--------------------------------------------------|---------------------------------------------|
| 1. High Rainfall regions<br>(1150 mm. and above) | 41,689                                      |
| 2. Medium Rainfall regions<br>(750-1150 mm.)     | 49,308                                      |
| 3. Low Rainfall regions<br>(upto 750 mm.)        | 47,123                                      |
| Total                                            | 138,120                                     |

The above figures emphasize the need for evolving suitable dry farming techniques to step up agricultural output in vast areas characterized by deficient rainfall. Research work in this direction was initiated in the erstwhile Bombay province in 1926. The need for such efforts has been greatly intensified by the recent introduction of high yielding varieties which require more water than ordinary varieties of crops. Regional imbalance will be aggravated if areas of deficient rainfall lag behind in agricultural development. Thus, the imperative need for increasing agricultural output as well as the desirability of balanced regional development underline the urgent necessity of evolving suitable varieties and adopting appropriate agricultural practices in regions of inadequate rainfall.

### III. Land Utilization

Before independence, the total geographical area of India was classified into the following five broad heads for purposes of land utilization statistics:

1. Area under forests
2. Area not available for cultivation
3. Uncultivated land excluding current fallows
4. Area under current fallows
5. Net area sown

In 1947, when the country became free, the erstwhile princely regions were merged with the former provinces and intermediate tenures like zamindari, etc., were abolished. Detailed land surveys had not been carried out in these areas in the past. The then available data were defective, because it gave no idea of the potential capacity of land for various uses, or even for potential supply of land for extension of cultivation. To get a better picture of the potentialities for land development for cultivation, as well as non-agricultural purposes, a land survey was undertaken in 1949-50.

Standard definitions of the various classes of land were evolved to be followed by all States. Prior to this, the available data were not comparable, because definitions of land classes among different States were not uniform.

There used to be a considerable time lag in the publication of the land utilization data, which has now been reduced from five to three years. There was no clear and meaningful distinction between culturable waste and fallow land; and between cultivable land and culturable waste. The classification suggested for immediate adoption with a view to facilitating accurate assessment of potential area available for cultivation, for grazing, for forest and tree growing etc., is as under:

1. Forests
2. Land not available for cultivation;
  - (i) land put to non-agricultural uses;
  - (ii) barren and unculturable land;
  - (iii) permanent pastures and other grazing lands;
  - (iv) miscellaneous tree crops and groves not included in the net area sown;
  - (v) cultivable waste;
  - (vi) fallow land other than current fallows;
  - (vii) current fallows.
3. Net area sown.

Data are also available regarding the area on which more than one crop is harvested in a year. This land is classed as "double cropped area" or "area sown more than once". Gross cropped area consists of net area sown plus area cropped more than once.

Detailed statistics of land use which mainly give the area of land put to different agricultural uses are available almost continuously from 1887-88. The present coverage of land use and crop statistics is about 94 per cent of the total geographical area of the country—77 per cent covered by complete enumeration, 5 per cent by sample surveys and another 12 per cent by conventional estimates. Since the remaining non-reporting area of 6 per cent is mainly covered by hills and forests and there is very little cultivation on it, the present position of land use in the country could be considered quite satisfactory although there is still scope for improvement.

The reporting area which stands for the area for which data on land use classification are available, has considerably increased from 284.3 million hectares in 1950-51 to 305.8 million hectares in 1968-69, i.e. from 87 to 94 per cent (Table V). Where land utilization figures are based on land records, reporting area is the one according to papers prepared by the village accountant. In some cases, the village papers may not be maintained in respect of the entire area of

the State. For example, such papers may not be prepared for the forest area, but the marginal role of such area is known. Also, there are tracts in many states for which no village papers exist but for which *ad hoc* estimates of classification of area are framed to complete the coverage. In such cases, this gives the summation of the area for which village papers actually exist and the area for which *ad hoc* estimates are available.

**Forests :** Area under forests includes all actually forested areas or lands classed or administered as forests under any legal enactment dealing with forests whether State owned or private. If any portion of such land is not actually wooded but put to some agricultural use, that portion is included under the appropriate head of cultivated or uncultivated land. Forest statistics are collected by the Forest Department in a State and published in the Indian Forest Statistics. Agriculture or Revenue Departments also collect forest statistics, but the two sets of figures do not tally. Some of the reasons for the same are:

- (a) Certain lands not covered by forests but worked by Forest Department, are counted as forests by the Forest Department and included in the area under forests. The same are not treated as forests by the Revenue/Agriculture Department, and are put under any of the other heads such as "other uncultivated land excluding fallow lands", if they are covered with shrubs, bamboos or other grasses and under "net area sown" if they are cultivated.
- (b) Forest areas deemed to be "unprofitable" and some of the areas administered as forests by corporate bodies or private individuals are sometimes classified by some States as "area not available for cultivation" or "other uncultivated land excluding fallow lands."
- (c) Difference in coverage both in respect of period and area.
- (d) Difference in the method followed by the two Departments in the enumeration of the forest areas.

**Land not available for Cultivation :** This consists of two parts. (1) Land put to non-agricultural uses—These are lands occupied by buildings, industrial undertakings, roads and railways or those under water e.g. rivers and canals, and all other lands put to non-agricultural uses. As in India, urbanization and industrialization lead to an increase in the area under this category. (2) Barren and uncultivated land—This covers all barren and uncultivated lands like mountains, deserts, etc. In Rajasthan, such lands lie mostly in the Thar desert, where the soil is sandy and rainfall is below 50 cm. In other States, they are generally in areas where the topography is hilly and/or is covered with laterites or such soils as are highly infertile, stony and coarse and the rainfall is insufficient so that

it is hardly possible to develop or cultivate these lands on a reasonable cost.

### Other Uncultivated Lands excluding Fallow Lands

(a) **Culturable Waste :** These include lands available for cultivation whether or not taken up for cultivation or abandoned after a few years for one reason or another. Such land may either be fallow or covered with shrubs or jungles which are not put to any use. Land once cultivated, but not cultivated for five years in succession is included in this category. It is a sort of residual class which includes all uncultivated lands not accounted for by any other class. Over 6 million hectares of land have been taken out of this category. It is a potential area for cultivation, though it would be a misnomer to describe that all the land under this category is 'culturable'. A Waste Land Survey Committee went into this matter in 1959 and studied the position for 7 important States in the country. Land available for cultivation in holdings over 100 hectares was estimated by the Committee at 4,50,000 hectares. Another survey for locating culturable waste lands in smaller blocks was taken up during the Third Plan. An additional area of 2.2 million hectares has been located which will be available for cultivation in the coming five years.

(b) **Permanent Pastures and other Grazing Lands :** These include all grazing lands, whether they are permanent pastures or meadows. The common land—*shamlat*—in the villages and grazing land in the forest area, are included under this head. These lands have tended to increase during the last one and a half decades, partly because in certain states there is a legal provision to maintain a minimum area for grazing cattle. The increase has been particularly noticeable in Maharashtra and Gujarat.

(c) **Land under Miscellaneous Tree Crops, etc :** All the culturable land put to some agricultural use, but not included under net area sown is included under this head. Lands under thatching grass, bamboo bushes and other grove trees for fuel etc., which are not included under (a) or (b), are placed in this category. Land under this category has decreased from 19.8 million hectares in 1950-51 to only 4.1 million hectares in 1968-69.

**Fallow Lands :** This category can be divided into two sub-groups : (a) fallow lands other than current fallows, and (b) current fallows.

(a) **Fallow Lands other than Current Fallows :** This includes lands which were taken up for cultivation, but are temporarily out of cultivation for a period of not less than one year and not more than

five years. The causes for such lands going out of cultivation may be :

1. Inability of farmers to cultivate for lack of means.
2. Inadequate irrigation facilities.
3. Unsuitable climate.
4. Unremunerative nature of farming.

About 7 per cent of the total geographical area of the country is still constituted as fallow land, though it was considerably reduced from 28.1 million hectares in 1950-51 to 20.8 million hectares in 1967-68. There was an increase of 2.2 million hectares during 1968-69 which was primarily due to bad weather conditions. Poor fertility is the major cause for land becoming fallow and much of it, in course of time, may be added to the category of 'cultivable waste'.

(b) **Current Fallows :** This class comprises cropped areas which are kept fallow during the current year. For example, if any planted area in the last season is not cropped again in the year reported, it is treated as current fallow. There is, however, a close link between the fallow land and the net area sown, since there are frequent shift-overs from one to the other. Good and timely rainfall, weather conditions, prices, political stability, security of tenure and tenancy conditions help in increasing the area sown.

**Net Area Sown :** It is the actual physical area under crops and orchards. Areas cropped more than once are counted only once in this category. This area has steadily increased from 118.7 million hectares in 1950-51 to 139.7 million hectares in 1967-68 (Table V). This addition has been possible because of land reclamation operations, reduction in fallow lands and appreciable decline in culturable waste, as a result of virgin lands coming under cultivation on account of new irrigation projects, adoption of soil conservation measures, etc. It is quite possible that net sown area may continue to increase as a result of the operation of these factors. Assuming that annual net sown area is of the order of a million hectares, it can be estimated that there is in the country today an area of about 143 million hectares as net sown which will constitute about 43 per cent of the total geographical area in the country.

India today is perhaps one of those countries where arable land under permanent crops constitute the maximum proportion of the total area in the country. During the year 1967, area under this classification in India was as much as 50 per cent against a figure of 32.2 per cent for Yugoslavia, 30.3 per cent for the United Kingdom, 29.8 per cent for Pakistan, and as low a figure as 4.3 per cent for Canada and 5.4 per cent for Australia (Table VI).

TABLE V  
Land Utilization Statistics—All-India (1950-51 to 1968-69)

| Particulars                                                                         | 1950-51 | 1955-56 | 1960-51 | 1965-66 | 1966-67 | 1967-68 | 1968-69 |

Source : F.A.O. Production Year-book, 1969.

**Area Sown more than once :** This represents that portion of the net sown area on which two or more crops are grown during the period of one agriculture year. With the introduction of high yielding varieties and the programme of multiple cropping, there is likely to be an appreciable increase in the area under this category. During the period 1950-51 to 1967-68 there was an increase of nearly 10 million hectares. During 1950-51 it was only 13.2 million hectares. The present trend is not to give any vacation to the land. Raising three or even four crops in a year is a sound farming practice. Intensive use of land is nothing new to the farming world. Farmers of Taiwan make every 40 hectares work for about 72 hectares in a year, those of South Korea about 61 hectares and Japan about 48.5 hectares.

The Indian Agricultural Research Institute, New Delhi, has taken four crops—*moong*, maize, potato and wheat—under scientific management. In 1969-70, a total hectare yield of 15.2 tonnes was obtained in 355 days. This works out to 42.8 kg. per day per hectare. These yields are roughly five times more than those obtained in 1940 in fallow-wheat sequence and three times more than from maize-wheat rotation in 1950.

Plant breeders have evolved short duration and photo-insensitive dwarf varieties. Rice, wheat, maize, *bajra*, pulses, potatoes and several other crops have been improved this way. They can now be raised in non-traditional seasons. For instance, the relay cropping of *Moong Baisakhi* sown in summer instead of in monsoon yields 10 quintals a hectare though the traditional monsoon sown *moong* yields only 2.5 quintals. In the following *rabi*, a hybrid or a composite maize can be grown instead of in *kharif*. This maize will yield about 73 quintals of grain. This can be followed by *Sharbati Sonora* wheat giving about 86.5 quintals. One advantage of relay cropping is that it cuts tillage operations down.

#### IV. Irrigation

Plants require moisture during germination, growth and formation of fruits. Most annual plants cease to need moisture towards the end of their life cycle, when they wither and dry away. Perennial tree crops need moisture throughout their life. Crops can be grown without soil, but not without water.

Human efforts to fight nature's niggardliness in the supply of water to agriculture takes the form of irrigation in the first attempt. A major function of irrigation is to mitigate the impact of irregular, uneven and inadequate rainfall with wide fluctuations from year to year. It averts serious famine and semi-famine conditions. It also supplements supply of rain water, particularly in a country like

India where rainfall is concentrated in most regions in the monsoon months of June to September (Table VII). This additional supply of water makes possible harvesting of two or three crops or cultivation of crops requiring perennial water supply. Irrigation has assumed increasing significance under Indian agriculture in the context of the new technology where high yielding varieties and multiple cropping patterns are being adopted.

In most parts of India, moisture is a great limiting factor in the successful raising of crops. For successful farming, irrigation is, therefore, necessary in one form or the other in all parts of the country where the mean annual rainfall is less than 75 cm. It is indispensable for the economical use of land. When irrigation is provided, both land and labour can be put to profitable use throughout the year; crop yields can also be doubled and money return increased by growing valuable cash crops.

Irrigation has been practised by man for several millennia. Perhaps the earliest irrigation started in Egypt on the river Nile, and there are indications of irrigation as early as 5000 B.C. There is evidence of a masonry dam having been constructed across the Nile in about the year 4000 B.C. From the numerous references available, the use of artificial irrigation in India can be traced to as early a period as the fourth millennium B.C. In the Vedas, the earliest sacred books of the Aryans, mention is made of wells, canals and dams.

During the excavation by the Archaeological Survey of India at Besnagar near Bhilsa in Gwalior, remains of an old irrigation canal which is supposed to have existed there during the third century B.C. or probably earlier were exhumed. Similarly, there is a notable example of the construction of the Grand Anicut across the Cauvery about the second century A.D. which was remodelled by the British during the 19th century.

Some of the existing canal systems are also believed to be centuries old. Archaeological excavations in cities of Harappa and Mohanjodaro have revealed indications of existence of canals dating as far back as 1,500 B. C. Probably, these canals supplied water to serve both the purposes, to supplement supply of monsoon water and also to fight arid and semi-arid conditions. Importance of irrigation as a source of artificial water supply was thus understood long ago. During the second half of 19th century, frequent and severe famines compelled the Government to consider seriously major extension of irrigation water supply. In pursuance of this objective an Irrigation Commission was appointed in 1901. Its Report became available in 1905. The Commission, for the first time, studied the irrigation potential for extensive areas of several river basins, indicated their

relative importance and laid down the principles governing investment in irrigation. During the following three decades major irrigation works were constructed. The Government, however, adopted a classification of irrigation works which led it to give preference to irrigation in regions where it would play a dominant role in extending cultivation. This policy resulted in restricting extension of irrigation and in concentrating the benefits to selected areas.

The Government classified irrigation works as : (i) productive, and (ii) protective. All works which did not yield revenue enough to meet interest charges after deducting cost were classed protective and only limited resources were committed to them. Studies of irrigation during the last two decades emphasized the indirect social benefits in the form of increased incomes, employment and foreign exchange earnings, with the result that the old classification was dropped and only the administrative classification of (i) major and medium, and (ii) minor irrigation works, was adopted. Upto the year 1964, the Plan schemes costing upto Rs. 10 lakhs were called minor schemes : the ceiling has since been raised to Rs. 15 lakhs. Schemes costing upto Rs. 5 crores are designated as medium and those over Rs. 5 crores as major ones.

**Irrigation Potential :** No scientific hydrographic study of India's water resources has so far been undertaken. Rough estimates have been made from time to time which provide only a broad and approximate basis of launching irrigation schemes. In 1903, the Irrigation Commission estimated that the river water resources of the country were of the order of 145 million hectare metres. In 1949, a study estimated that the surface flow of water in the country was about 169 million hectare metres. But owing to physiographical conditions of the country, only one-third of this surface flow or about 561 million hectare metres could alone be used for irrigation purposes and about 45 million hectares could be irrigated. Since there is a good deal of confusion about the data on irrigation potential, periodical surveys in this respect are likely to be undertaken soon.

**Surface Water :** The average annual surface water resources of India are now placed at a total of about 168 million hectare metres. Of this, only about 56 million hectare metres can be used for irrigation on account of physiographical conditions. Upto 1951, 9.5 million hectare metres or about one-sixth of the usable flow had been utilized. By the end of the Third Plan, the volume of utilization increased to 18.5 million hectare metres or nearly one-third of total availability. It is estimated that during 1966—69, the utilization is estimated to have increased by another 2 million hectare metres. It is proposed, during the Fourth Plan, to bring about an additional utilization of 5 million hectare metres under major, medium, and

minor schemes, bringing the total utilization to 25.5 million hectare metres or 46 per cent of the usable flow.

The ultimate area that can be irrigated from major, medium and minor schemes (excluding groundwater) by using 56 million hectare metres of water has been assessed at 60 million hectares.\* Further, more intensive investigations in different States might indeed reveal that this figure is somewhat on the low side. For the present, however, the country's irrigation potential may be placed at 45 million hectares through major and medium irrigation and 15 million hectares through minor irrigation. At the beginning of the First Plan, irrigation from major and medium works was 9.7 million hectares and from minor, 6.4 million hectares. The potential expected to be created by 1968-69 from major and medium schemes is 18.6 million hectares and from minor schemes 8.1 million hectares. The balance of potential that can be created is 26 million hectares through major and medium schemes and about 7 million hectares through minor schemes.

**Groundwater :** It is estimated that about 22 million hectare metres of groundwater can be exploited for irrigation purposes to serve 22 million hectares. At the beginning of the First Plan, 6.5 million hectares had been developed. This increased to 8.2 million hectares at the beginning of the Third Plan. It is expected to reach 10.9 million hectares by 1968-69 leaving a balance of about 11 million hectares (Table VIII).

There is a need to re-examine the underground water resources also. Thus the Indo-Ganga plains are known to be several thousand metres deep and the entire plains are thus capable of being covered by conventional wells or tube-wells for irrigation purposes. The total cropped area of the Punjab, Haryana, Uttar Pradesh and Bihar alone is around 60 million hectares. Then there are large coastal areas of Andhra Pradesh and Tamil Nadu and huge areas of Madhya Pradesh, Maharashtra, Gujarat, etc., which can also be irrigated with the help of underground water. The available figures may thus turn out to be a gross under estimate when a careful study is made.

**Progress of Irrigation :** A characteristic feature of the Indian irrigation system is that quite a significant part of it is State-operated. There has been considerable progress in the construction of State canals and tube-wells in the last and present century. However, the area irrigated by minor works such as wells and tanks still predominates in the total irrigated area in the country which exceeds that in any other part of the world.

---

\*All irrigation potential and utilization figures mentioned in this chapter refer to gross areas.

**Note :** In the case of minor irrigation, utilization has been assumed to be the same as potential, as actual utilization figures are not available.

**Source :** Fourth Five Year Plan, 1969-74, p. 247.

Irrigation practices in the country can be traced to the prehistoric period although substantial development took place only during the nineteenth century. The pace has further been accelerated during the era of development planning. Irrigated area increased from about less than a million hectares in 1800 to about 22.6 million hectares in 1950-51 on the eve of the First Plan.

India embarked on planned economy in 1951. Although during the years after the Second World War some reconstruction schemes in irrigation were taken up for construction, a dynamic policy for irrigation can be said to have started only with the initiation of the First Plan in 1951. The irrigation development programmes assumed vital importance with the introduction of multi-purpose schemes which combined generation of power with irrigation.

Formerly, the irrigation canals were mostly inundation ones. With the arrangements for aquaducts, water lifts and multi-stage diversion dams, the benefits of irrigation could be made available to areas with varying ground elevations. Generation of power together with canal irrigation, reduced the cost of irrigations and some works which were considered non-paying, became remunerative. There is an addition of nearly 50 per cent in the irrigated area during a period of 17 years from the beginning of the First Five Year Plan (Table IX). This shows that the progress made in a short period of 17 years is roughly equal to half of what could be achieved during a period of one and a half century.

While the total area under canals has increased only by about 25 per cent, major improvements have taken place in the area under wells. Tube-wells which were more or less non-existent on the eve of the First Five Year Plan, provided irrigation for an area of over 2 million hectares during 1967-68. There has been a phenomenal increase in this area since then.

The popular demand for groundwater schemes, namely, dug-wells, tube-wells and pump sets have been given priority in the past few years as these works provide the nuclei for high yielding varieties, not only in dry areas but also in the canal irrigated areas (the canal supply alone being inadequate for meeting the time bound requirements for irrigation of the high yielding varieties). During 1970-71, about 2.65 lakh electric pump sets, 1 lakh private tube-wells and 1,000 State tube-wells were to be installed. This would mark an advance over the achievement in the previous year, which amounted to installation of about 2.6 lakh electric pump sets, 90,000 private tube-wells and 800 deep tube-wells. In addition, about 1.70 lakh dug-wells were to be constructed during 1970-71.

So far, initial scrutiny from the hydro-geological angle of the groundwater schemes on an area basis has been carried out only

in respect of schemes refinanced by the Agricultural Refinance Corporation. It has been suggested to the State Governments that such scrutiny should also be exercised in the case of schemes financed by Land Development Banks, Central Co-operative Banks and Commercial Banks under their normal programme. Further, the States have been asked to provide boring and drilling facilities to the cultivators on commercial lines.

**Central Groundwater Board :** The expansion of groundwater development programme called for intensive coordinated efforts for scientific groundwater investigations. An important step in this direction was the creation of the Central Groundwater Board in place of the Exploratory Tube-wells Organization which had been carrying out groundwater exploration for the last 15 years. While the Board will continue to undertake deep drilling wherever it is considered necessary for exploratory purposes, its primary function now onwards will be to conduct resource evaluation studies in representative areas with a view to establishing the limit of safe pumping. The Board will also extend its exploratory activities in hard rock areas. A survey project is being taken up by the Board with the assistance of Canadian International Development Authority in the hard rock areas of Andhra Pradesh. A few more projects are planned to be taken up in other hard rock areas in Maharashtra, Madhya Pradesh and Karnataka.

A project for water resource evaluation of the Narmada Basin is also to be taken up shortly.

**Groundwater Organizations in the States :** The sharp expansion of groundwater development has called for commensurate organizational efforts. If the States are to take full advantage of the unprecedented opportunities opened up for financing their groundwater development programme, they would have to strengthen immediately their groundwater organizations so as to ensure that not only compact area schemes are drawn up on the basis of scientific hydro-geological data but that such schemes are also sanctioned and implemented expeditiously.

**Autonomous Tube-well Corporations :** There are certain areas in the country where groundwater is available only at very great depths upto 300 meters and more in some cases—and can therefore be tapped only at a considerable expense. Also, there are several locations where larger river pumping schemes would be far more economical than individual installations. The development of irrigation in such areas as well as in areas where large size community works are needed to cater to the needs of small farmers, can perhaps best be done by autonomous corporations. These corporations can mobilize institutional finances for financing their new additional programmes. Haryana, Punjab and Gujarat have already set up such corporations.

**Groundwater Legislation :** Considering the situation emerging as a result of the spectacular expansion of groundwater in recent years, the Conference of Commissioners of Agricultural Production 1969, strongly recommended that the Government of India should formulate and circulate a model bill for control and regulation of groundwater. A model bill has been circulated to the States for passing suitable legislation.

**Irrigated Area :** The latest available data for 1967-68 indicate that gross irrigated area in the country has increased by 46.8 per cent and the percentage of the irrigated area to gross cultivated areas has increased from 17.1 to 20.3 percent during the period 1950-51 to 1967-68 (Table X). Recently there has actually been a good deal of emphasis on minor irrigation as a result of the implementation of the new strategy for agriculture. During the Fourth Plan period, an additional 12.54 lakh tube-wells and pump sets are likely to be energized bringing the total figure to well over 23.37 lakhs as against 5.13 lakhs at the end of the Third Plan. In Tamil Nadu alone, 5.5 lakh irrigation wells representing over one-third of the total number of wells in the country and providing irrigation for over 640,000 hectares have already been connected to power. The Electricity Board proposes to energize, on an average 60 thousand pump sets each year.

About 2 million hectares of additional irrigation potential created under major and medium irrigation projects in the country remains unutilized for one or the other reason. As against 9.7 million hectares of irrigation potential achieved under the Plans upto 1969-70, the potential actually utilized is stated to be only about 7.9 million hectares.

With regard to the distribution of irrigated area, as much as 63.6 per cent of the total cropped area in the Punjab was irrigated during 1967-68. The corresponding figures for Tamil Nadu, Jammu and Kashmir, Andhra Pradesh and Uttar Pradesh were 47.5 per cent, 37.2 per cent, 31.0 per cent and 28.0 per cent respectively. Madhya Pradesh and Maharashtra with 5.9 per cent and 7.7 per cent respectively are at the end of the list of irrigated area. From among all the States, Madhya Pradesh was the only one where the share of gross irrigated in the total cropped area remained unchanged at 5.9 per cent during the planned period of 17 years.

In the increase in the gross irrigated area during this period, Punjab tops the list with an increase of 253.2 per cent followed by Gujarat with 224.7 per cent, Haryana 176.8 per cent and Karnataka by as much as 97.5 per cent. Orissa with 10.8 per cent increase is the lowest on record and next comes Assam with 12.9 per cent followed by Jammu and Kashmir with 14.4 per cent increase (Table XI).

**Crops Irrigated :** There has been a good deal of change in the utilization of irrigation as between various crops, although the share of foodgrains in the total irrigated area of the country was reduced from 81.2 per cent in 1950 to 78.8 in 1967-68. Cotton improved its position during this period from 2.1 to 4 per cent but other cash crops failed to attract irrigation facilities. While the share of rice declined from 43.6 to 41.8 per cent, that of wheat improved from 14.4 to 19.5 per cent during this period. The position with regard to coarse grains and pulses, however, remained as bad as before. The share of irrigated area during 1967-68 under wheat has steadily increased to 43.5 per cent against 38.5 per cent for rice and 26.1 per cent for all foodgrains. From among the cash crops, sugar-cane had 73.9 per cent of the area irrigated followed by cotton at 16.6 per cent during 1967-68.

Tamil Nadu and Andhra Pradesh were the only two States in the country where over 90 per cent of rice was irrigated in 1967-68. Next were Jammu and Kashmir and the Punjab with 86.8 per cent and 81.8 per cent respectively. With regard to irrigated wheat, the Punjab again topped the list with 70 per cent followed by Gujarat with 63.8 per cent, Haryana 60.5 per cent, Rajasthan 59.8 per cent and Uttar Pradesh 50.9 per cent against the all-India figure of 43.1 per cent. In respect of all foodgrains too there were only three States, Punjab, Tamil Nadu and Kerala where over 50 per cent of the area under foodgrains was irrigated. Corresponding figures for Andhra Pradesh were 37.3 per cent, Haryana 30.3 per cent, Jammu and Kashmir 32.7 per cent and Uttar Pradesh 26.3 per cent. Madhya Pradesh and Maharashtra were the only two States where the share of irrigated area in total foodgrains was only 6.1 and 7.1 per cent respectively.

Sugar-cane is another important crop where 100 per cent of the area was irrigated in Karnataka and over 95 per cent in Tamil Nadu, Rajasthan, Maharashtra, Gujarat and Andhra Pradesh. Bihar is the only State where 27.3 per cent of sugar-cane area was irrigated. In no other State is the irrigated area for sugar-cane less than 50 per cent. Over 90 per cent of the cotton crop in the Punjab and Haryana is irrigated. The figures for Uttar Pradesh are 89.2 per cent and for Rajasthan 72.3 per cent. Tamil Nadu had only 24.2 per cent of the cotton area irrigated and States like Andhra Pradesh, Maharashtra and Madhya Pradesh had only 2 to 4 per cent of the area irrigated (Table XII).

**Irrigation Costs :** The cost of completing irrigation projects under various stages of construction has increased by about Rs. 250 crores over the past three years. As against the increased costs, the provision made for major and medium irrigation projects in the Fourth Plan is only Rs. 954 crores. Following the rise in the cost of projects subsequent to the formulation of the State Plans, the Union Ministry

TABLE XII (Contd.)  
State-wise Total Area, Irrigated Area and Percentage Irrigated under Important Crops : 1967-68

| State             | Sugarcane |           |             | Ground-nut |           |             | Cotton |           |             | Gross   |           |

of Irrigation and Power has assessed that a shortfall of about 6.4 lakh hectares might arise during the Fourth Plan in the six major projects of Nagarjunasagar and Tungabhadra High Level Canal (Stage II) in Andhra Pradesh, Sone High Level Canal in Bihar, Chataprabha (Stage II) in Karnataka, and Ramganga and Gandak in Uttar Pradesh. Some other irrigation projects in Madhya Pradesh, Bihar, West Bengal, Orissa and Kerala, which are also behind schedule are likely to increase the total shortfall to 9.6 lakh hectares in the anticipated additional irrigation potential.

If the target of 3.6 million hectares of an additional irrigated area in the next three years is to be achieved, the outlay on irrigation projects in the Fourth Plan will have to be raised by Rs. 110 crores. So far, Rs. 1,942 crores were spent on various major and medium irrigation projects. A further sum of Rs. 1,426 crores is now estimated to be required for completing the continuing schemes. During the first three Plans and the annual Plans, 76 major and 460 medium irrigation projects were undertaken in various States ; of these only 16 major and 299 medium projects have been completed so far. Work on the remaining projects is to be continued in the Fourth Plan. The total cost of these projects estimated when they were sanctioned was about Rs. 1,940 crores. Although about Rs. 1,765 crores have already been spent, the spillover cost is assessed by the State Governments at Rs. 1,426 crores.

If the Fourth Plan target as envisaged is to be achieved, an additional five million hectares will have to be irrigated under the sanctioned schemes. The revised gross area that can ultimately be irrigated under major and medium projects has been assessed at 51.8 million hectares.

**Irrigation Rates :** There are mainly four ways of charging the irrigation rate : (1) volume system ; (2) uniform rate system ; (3) differential rates system, crop-wise ; and (4) lease system.

Under the volume system the irrigation charge is levied on the basis of actual quantity of water used. Under the uniform rate system, water rate is charged uniformly, i.e., on the basis of area irrigated without making any differentiation on the basis of crops. Under the differential rates system, the rate differs crop-wise per hectare. Under the lease system, the rates are fixed by mutual agreement between the Irrigation Department and farmers, the period of lease depending upon the period for which the supply of water is assured. The last basis is usually confined to some specific cases and is not a common method of determining the water rates. The most common basis adopted is the differential rate system. To encourage economy in the use of water, the canal charges are reduced to half for lift irrigation as compared with irrigation charges for flow system. Irrigation

water has been supplied free or at concessional rates to popularize it among the farmers for certain farming practices, e.g. growing of green manure or early fodder crops, etc.

In the new irrigation undertakings, the basis of fixing irrigation rates vary. In the Tungabhadra Project, water levies are computed on the basis of net income per acre and the volume of water necessary to bring the crop to maturity. Net income is arrived at on generalizations. No scientific study or analysis has been done for this purpose. In the Hirakud Project, water rates are based on increases in the gross income per hectare. In practice, there is not much difference between this and the net income approach as the latter is not worked out on any well-defined principles. In Bhakra Nangal, water rates are based on the existing occupiers rates.

**Irrigation Policy :** A total investment of over rupees one thousand crores has been made in major and minor irrigation during the first three Five Year Plans. A proper utilization of water made available at such a heavy cost is, therefore, extremely necessary, particularly when improved varieties of seeds giving high yields would need proportionately larger quantities of water. The Fourth Five Year Plan is alive to the problem. A centrally sponsored scheme for command area (Ayacut) development is in the Plan. This envisages an integrated approach using improved agricultural practices in relation to irrigated farming, co-operation, and development of rural industries.

**Existing Problems :** (1) There is lack of co-ordination between irrigation and agricultural development. In the State canal system generally the supply of water is not well co-ordinated with its requirements for crops. Changes in cropping pattern and farming practices alter the demand for water both in volume and time of its supply. The irrigation authority takes action to adjust the supply to changes in demand after a considerable time-lag. An extension programme, encouraging a change in land use programme and farming practices, use of fertilizers, etc., depends a great deal on an efficient irrigation service. Similarly, it is also true that development of irrigation depends a great deal on an effective planning of crop rotations and farming practices. But neither have gone hand in hand. Consequently, a proper use of irrigation facilities has been quite a delayed process. In an accelerated programme of irrigation development, under the Five Year Plans, attention has been drawn to this shortcoming because of wide gaps between the targets and the actually irrigated areas.

(2) Water rates have not been determined on a scientific basis.

(3) There has been inadequate attention to drainage needs. Canal and road construction interferes with natural drainage places. Canal irrigation works were constructed in areas having wells where

the canal substituted to a large extent the well-irrigation. Instead of encouraging wells as a supplementary means of irrigations, in some States, the construction of wells was even prohibited in the canal commands. Such restrictions have now been removed. Under the Plans, an attempt has been made to fix priorities between the major and minor works on the basis of cost and return ratio for the first time. Unfortunately, wells and tanks have been put together for the calculation of cost and return ratio of the minor irrigation works. The result has been that the calculations show that the returns per unit of investment from the minor projects are lower than the major projects. This led to a wrong emphasis on major works. The return has also not been worked out on any scientific basis. Lack of attention to a proper basis for calculating the cost and return ratio, lack of data needed for such calculation, disregard to difference in the time factor in the availability of irrigation, the relative sizes of investment needed, and the combining of wells and tanks into one for estimating the cost and return ratio from minor irrigation works, led the planners to an irrigation policy which experience revealed far from right. Since then, emphasis has been placed on minor irrigation projects.

(4) Canals have also aggravated the problem of floods every year despite anti-flood measures and construction of dams. The river flow is slowed down, silt deposit increases and the river bed becomes shallow, reducing the capacity of rivers to drain the surplus rain water. Rivers are the most effective natural drainage systems, and any unplanned interference with them is bound to have its repercussions on the natural drainage and, therefore, on the incidence of floods in a country with the rainfall concentrated in short periods.

(5) Planned research is necessary on water requirements of crops under different soil conditions and farming practices.

**Advisory Panel on Irrigation :** The Union Government has set up a 13-member Advisory Committee on irrigation, flood control and power projects headed by the Secretary to the Ministry of Irrigation and Power. The Committee will examine irrigation, power, flood control and other river valley projects proposed by the State and Union Governments and other authorities and advise the Commission and the Ministry of Irrigation and Power on the merits of individual projects. While work on some schemes may commence in the Fourth Plan period, their implementation may be spread over the subsequent Plans.

The Committee will examine whether the schemes have been prepared after detailed investigations, whether they are technically sound, and if the estimates are complete and correct, it will scrutinize whether the financial forecasts and the estimates of benefits to be

derived are based on accurate data. With regard to power generation schemes, the Committee will examine whether they have been prepared so as to fit into the load characteristics of the region and serve the regional requirements as a whole. The Committee will also see if each scheme has been examined from the inter-State angle and if there is agreement between the States concerned in respect of schemes in which the interests of more than one State are involved. It will determine the procedure for receiving schemes from Central and State Governments.

**River Basin Plans :** For integrated development of water and land resources, Master Plans have to be drawn up for long-term development of irrigation in each river basin, including inter-State rivers. In preparing these plans, the optimum economical development of a river basin has to be kept in view, covering various aspects such as irrigation, flood control, navigation, and soil conservation. The development of groundwater resources would also need to be co-ordinated. Such development would often run across State boundaries. Works would have to be executed in a State other than the one in which the benefit will result. Preparation of a few basin-wise plans will be taken up in the Fourth Plan so that future schemes dovetail into these plans.

Research in irrigation, hydraulics, soil mechanics, and construction materials is being conducted in the Central Water and Power Research Station at Poona, the Central Soil Mechanics Concrete Research Station at Delhi, and other research stations in different States. These stations are engaged in applied engineering and fundamental research. The research programmes are co-ordinated by the Central Board of Irrigation and Power. With the larger programmes of development now being undertaken, the activities of these organizations will be broadened in the Fourth Plan.

**Panel on Water Resources :** A panel on water resources has been set up which will advise, in the light of scientific and technological considerations, on long-term planning of water resources, including their assessment, exploitation, and conservation. It will recommend the lines of research and investigation necessary for the integrated use of surface and groundwater resources. It will also consider other important aspects such as water-logging and salinity. As a step towards long-term planning, the panel will indicate priorities in the survey and exploitation of water resources, both surface and underground. For the optimum utilization and conservation of these resources, and for intensifying agricultural productivity, it has been recognized that proper distribution and management of water on the field is essential through measures such as land shaping, construction of field channels, and provision of adequate drainage.

Apart from the panel, attention is being given to studies and investigations designed to improve the efficiency of water management, public and private, with due regard to all the relevant factors such as soil conditions, plant-water relationship, farm practices and farm management.

**Minor Irrigation Corporation :** The Union Agriculture Ministry has mooted a Minor Irrigation Corporation on the lines of the Rural Electrification Corporation. The scheme envisages creation of a special fund of Rs. 150 crores for financing minor irrigation works like tube-wells, lift irrigation and storage tanks. Part of the money may be provided by the Union Government and the rest by the United States Agency for International Development out of the P.L. 480 rupee resources. The special fund, it is proposed, may be utilized to sanction long-term loans for selected viable irrigation projects. The rapid loans and the interest earned may be recycled on a continuing basis to refinance minor irrigation works. The State Governments may be required to guarantee the repayment of the loans and the interest so that the security and revolvment of the Corporation funds are assured.

The total outlay earmarked for minor irrigation schemes in the Fourth Plan is Rs. 468 crores. Of this, about Rs. 200 crores are accounted for by contributions towards debentures of institutional agencies, subsidy, direct loans and purchase of equipment. The balance of Rs. 268 crores is left for State works, including surface water flow irrigation projects, lift irrigation projects and tube-wells.

**Special Fund for Minor Irrigation :** The Agricultural Refinance Corporation, (ARC) established eight years ago to refinance the long and medium-term requirements of agricultural credit institutions, has upto June 30, 1971 committed Rs. 248.66 crores of which Rs. 16.68 crores are for minor irrigation. The assistance covered 458 schemes of which the share of ARC was 71.4 per cent. The total number of schemes sanctioned by ARC during 1970-71 was 100 involving financial assistance of Rs. 62.15 crores of which its share was Rs. 53.92 crores.

The total amount of refinance drawn from ARC as on June 30, 1971 amounted to Rs. 89.71 crores, of which Rs. 81.25 crores were drawn by the Central Land Development Banks, Rs. 4.42 crores by Commercial Banks and Rs. 4.04 crores by the State Co-operative Banks.

States like Kerala, Orissa, West Bengal and Assam have drawn little or have lagged behind in availing themselves of funds sanctioned by ARC. In its help to small farmers, ARC's programme includes two schemes—one in Haryana and another in West Bengal. The scheme in Haryana envisages the construction of 170 deep tube-wells

in Ambala district. The West Bengal scheme envisages the construction of 300 shallow tube-wells in three blocks in the Hooghly district.

To broadbase its activities, ARC has decided to concentrate on dry farming projects with the aim of helping small farmers. It has also agreed to meet the full cost of loans of the Commercial Banks which take up emergency well digging programmes in areas affected by drought or other natural calamities.

**Irrigation Commission :** The Irrigation Commission set up by the Union is under Ajit Prasad Jain. Its terms of reference are to : (1) review the development of irrigation in India since 1903 when the last Irrigation Commission made its report and the contribution made by irrigation by increasing the productivity of land and in providing insurance against the vagaries of rainfall; (2) examine the irrigation facilities available in chronically drought affected and food deficit areas and suggest essential and minimum irrigation works to be undertaken in them; (3) draw up a broad outline development of all types of irrigation for achieving self-sufficiency in cereals and for maximizing the production of other crops and make a broad assessment of funds required; (4) examine the adequacy of water supply in major irrigation projects; (5) examine the administrative and organizational set up for the planning, execution and operation of irrigation works, particularly to speed up completion of projects and reduce their gestation period; (6) suggest criteria for sanctioning irrigation projects and (7) examine other matters, related to the development of irrigation in the country and make suitable recommendations.

## V. Soil Conservation and Dry Farming

Soil conservation measures in practice are designed to improve the soil and raise its productivity. The programme is, in fact, an integrated approach to the proper use and care of the land, using the technical knowledge of various branches of agriculture relevant to the problem in each specific case. No doubt it is a major effort against prevention of erosion and loss of soil, but the recent advances in soil conservation have considerably enlarged its scope which includes land use planning and improvement in soil structure and fertility, in addition to anti-erosion measures such as terracing, contouring, strip cropping, filling gullies, or planting excessively steep or erodable land with grass and trees. It also covers drainage of wet lands and irrigation of the dry ones; and addition of fertilizer and organic matter if the soil is deficient in them. The term soil conservation is now becoming synonymous with soil management.

**Soil Erosion :** Soil erosion is the process by which soil particles are transported from one place to another through the agency of wind or water in motion. Experiments conducted at different research

stations in the country have indicated a soil loss of at least 50 tonnes per hectare on cultivated land with one per cent slope against a soil loss of 1.25 tonnes on land with natural vegetation. The total energy of rain drops has been calculated as being roughly equal to 250 horse power over a hectare during a rainfall of 2.54 cm. which has sufficient force to lift nearly 18 cm. of top-soil layer to a height of over 90 cm. 86 times during an hour's rain. Suitable measures to control erosion comprise vegetative cover, rotation of crops, strip-cropping, terracing, contour cultivation, listing, drainage shelter-belts, deferred grazing, etc.

**Early History of Soil Erosion :** Soil erosion in its different forms and shapes has been going on for centuries. Classic examples are those of the now buried mighty civilizations of Babylonia and Assyria. If an example is required in India itself, one only has to see the ruins of Taxila and Harappa. There was a time when Bijapur was the capital of a flourishing kingdom. It is now a picture of devastation. Famines are its recurring feature. Evidence shows that as early as the time of Alexander the Great, there were thick forests and well populated cities in the north of Kutch and the south of Punjab which now form a part of the Rajasthan desert. All this happened because of wind erosion as a result of the abuse of land. Surat was, in living memory, a large commercial city. Its population during the last 50 years has come down appreciably. This is because the river Tapti has become unnavigable as a result of sedimentation caused by erosion in the uplands.

The Rajasthan desert which already covers an area of about 2,00,000 sq. kilometres is advancing towards the Ganga Plain at the rate of about 800 metres a year over a front of about 1,600 kilometres. The beautiful Nilgiris, the hillsides of the Himalayas in Kumaon and the Shiwaliks from the Punjab to Assam are also being fast eroded for want of afforestation.

Today, according to available estimates, about 50 million hectares of land in India are affected either by soil erosion or exhaustion caused by unplanned cutting of forests and bad farming. A random soil survey also reveals that 71 per cent of the area in the scarcity tract has been severely eroded and 26 per cent has been rendered useless for agricultural purposes. If nothing is done to arrest this recurring loss, reclamation of new areas provides no solution to the land problem in India because the losses by erosion will far exceed the gains. Soil erosion is caused mainly by unplanned removal of forest cover in the upper reaches, indiscriminate grazing of vegetation especially during the summer months, and wrong methods of cultivation on sloping lands without necessary protection.

In course of time, from an unnoticeable event in the beginning, soil erosion becomes a menace and deep gullies are formed. The

fertile top layer is gone. The soil becomes poor and less productive and ultimately refuses to respond to any cultivation. Troubles do not end with loss of productive power or unproductive farming. River beds become shallow. They lose their efficiency as natural drainage channels, incidence of flood increases devastating vast areas year after year. To poor yields is added the destruction of crops and loss of cattle and human lives. Navigability of rivers is greatly reduced. Because of shallow beds, the rivers' capacity to hold water during dry months is much less, causing further hardships in the supply of irrigation and even drinking water in many areas. It has been truly said that "civilization is rooted in the soil". The destruction of soil leads to destruction of the very root of civilization. Soil conservation is thus of interest not only to a physical scientist but is also a matter of great concern to social scientists as well.

Public attention was drawn to the menace of erosion in India by Glover in 1944. Sir James Penny, the then Financial Commissioner of the Punjab pointed out the importance of common grazing grounds which had been destroyed. A team of American Soil Conservation Specialists on its way back from China toured India. It explained at length how agricultural engineers, foresters, agronomists, range managers, biologists, soilmen, farm managers and above all the farmers themselves had worked collectively in the U.S.A. to fight this national scourge. The basic unit of planning in the U.S.A. was a single farm which, on an average, approximates 57 hectares, but the team favoured a village as a basic unit of planning for purposes of demonstration in India.

The team further recommended a soil and water conservation law and the creation of a service similar to the Soil Conservation Service of the United States Department of Agriculture. No piecemeal solution of the problem was possible. An Indian team which visited the U.S.A. in 1947 pointed out that the farmers could adopt soil and water conservation practices if they were shown in a practical way that these measures not only prevented soil deterioration but also paid substantial dividends. The team recommended that the entire village should be used as a unit of planning. This would illustrate better how certain conservation practices such as drainage or terracing, which cannot be effectively applied to small individual parcels of land, can be used on a co-operative basis ignoring the ownership boundaries.

Training and education programmes in soil conservation were emphasized. The intention was not to treat soil conservation as a separate subject, but to integrate the simple principles of sound land use with other scientific subjects, so as to make the future generation conservation minded.

**Legislation :** India can be proud of being one of those countries which has the earliest legislation on soil conservation. This problem is as old as agriculture itself. It is only in recent years that it received some attention from both Central and State Governments in this country. One of the first laws for the prevention of soil deterioration was passed in 1904 in the Punjab under the Land Preservation Act. The Act provided for such measures as *wat bandi*, contour trenching, gully plugging, terracing, tree planting, preservation of forests, etc., for preventing the havoc caused by the torrents. Systematic soil conservation work commenced only in 1936 when public co-operation was geared to the programme through the creation of co-operative societies.

In Maharashtra, soil conservation work was started in 1939 when the scheme for bunding and dry farming survey and development was sanctioned. The work was further strengthened when the Land Improvement Schemes Act of 1942 was passed and the Cusrow Wadia Fund was created for subsidizing bunding work. As a result, about 600,000 hectares of land were covered with contour bunding by the end of the First Five Year Plan. A similar Act was passed in Madras (Tamil Nadu) in 1949. In Uttar Pradesh, soil conservation measures were taken over from zamindars for erosion control and creation of fuel and fodder reserves.

The First Five Year Plan provided an opportunity for a co-ordinated approach to this programme. It was recognized that various State Governments should be armed with legal authority to overcome any opposition. The Central Government thus reviewed the existing legislation and proposed a Model Soil Conservation Bill on the lines of the U.S. legislation on Soil Conservation Service. The objectives of this Bill were :

1. Conservation and improvement of soil resources.
2. Prevention or mitigation of soil erosion.
3. Protection of land against damage by floods or drought.
4. Reclamation of waste land.

The Model Bill was sent to the State Governments for adoption. Most of the State Legislation is now based on this Model. The broad pattern of the Bill follows the Bombay Land Improvement Schemes Act, as subsequently amended by that Government. It is comprehensive and covers the following aspects :

1. Power to regulate, restrict or prohibit certain matters in the notified areas, inquire into claims and award compensation.
2. Constitution of the State Land Improvement Board and the manner of its working, constitution and functioning of the District Land Improvement Committees.

3. Appointment of an Executive Officer for a scheme under the Act with powers to get work executed by the owners of land at their cost if they are willing or at the cost of the Government subject to subsequent recovery. The executive officer is required to prepare a statement showing the details of the work done, amounts and nature of recoveries to be effected from the owners, responsibility of maintenance and other prescribed particulars. Responsibility for the maintenance of such work is that of the persons enumerated by the Executive Officer. Appeal against the actions under the Act lies with the State Government whose orders are final and cannot be called to question in any court. The penalty for contravening any of the provisions of a scheme that has come into force is prescribed.

The Act provides for the preparation and execution of schemes for the conservation and improvement of soil resources, prevention of soil erosion, protection of land against damage by floods and drought, reclamation of waste lands, etc. Also State Land Improvement Boards and District Land Improvement Committees which would be responsible for getting the work done in each State could be set up. These Boards and Committees are empowered to acquire waste land for improvement.

**Central Soil Conservation Board :** As a result of the increasing awareness of the problems of the soil deterioration and its impact on the economic stability of the country, the Central Government created in 1953, the Central Soil Conservation Board for co-ordinating work on an all-India basis. Its main functions are to organize, co-ordinate and initiate research on soil conservation, to meet the paucity of trained personnel for manning soil conservation schemes and to assist State and River Valley Projects technically and financially, by advancing loans and giving subsidies, to carry out their soil conservation programmes. The Board gives financial assistance to private farmers only through State Governments and River Valley Project authorities.

During the First Five Year Plan, the Board worked out a programme to extend soil conservation measures to about 200,000 hectares. More recently it drew up a phased programme to cover about 80 million hectares by the end of the Seventh Plan period.

**Research and Training :** The Central Soil Conservation Board has established ten research centres one each at Dehra Dun, Kotah, Ootacamund, Bellary, Vasad, Agra, Chandigarh, Chhatra, Jodhpur and Ibrahimpatnam. The centres at Dehra Dun, Chandigarh and Chhatra deal with erosion problems in the hills in the Himalayas in the Punjab, Himachal Pradesh and Uttar Pradesh. The Ootacamund

centre investigates problems on hill-side erosion in the Nilgiris, particularly in relation to heavy rainfall conditions. The centres at Agra, Kotah and Vasad have undertaken work on conservation of ravine areas in Uttar Pradesh, Madhya Pradesh, Rajasthan and Gujarat. Stabilization of marginal lands and gullies in alluvial soils forms the main plank of investigation at these centres. Soil conservation problems of deep black soil of Maharashtra, Tamil Nadu, Andhra Pradesh and Karnataka are investigated at Bellary, while the centre at Jodhpur deals mainly with problems of drifting sand and methods of desert control. The newly started station at Ibrahimpatnam will look after the problems of red soil. Some of the States also have Soil Conservation Research Stations which deal with specific problems.

Soil conservation research work carried out at various research stations covers the different fields in associated disciplines of hydrology, engineering, forestry, agrostology, agronomy, soil sciences, etc. Small defined watersheds under different land use managements like forestry, grasslands, cultivation, etc., are being calibrated to study runoff and soil loss patterns. Runoff and soil loss studies are being made under various soil conservation treatments also. Suitable designs for engineering structures to control runoff and soil erosion; suitable tree and grass species for forestry and grassland management; suitable cultural and agronomical practices for cultivated lands; special soil conservation measures for ravine reclamation, gully and torrent control, landslip treatment, etc., are being studied on a regional basis at different research stations.

In order to provide for trained personnel for both research and extension work, the centres at Dehra Dun, Kotah, Ootacamund and Bellary conduct training classes in soil conservation. The course is also conducted at Hazaribagh in co-operation with the Damodar Valley Corporation. At Dehra Dun the courses are held for officers while at Bellary, Ootacamund, Kotah and Hazaribagh, the courses are for assistants.

**The Planned Era :** The magnitude of the problem was fully appreciated in the First Five Year Plan. The schemes under soil conservation—a pioneer national plan—falls under three heads. In the first category, are schemes aiming at immobilizing deserts. The second refers to measures for bunding and terracing on agricultural land. The third tackles afforestation on ravines and badly gullied lands. The importance of sound and simple soil conservation measures such as contour ploughing—ploughing fields across instead of up and down the slopes—strip cropping, sowing of cover crops like gram, cowpea or ground-nut in strips to prevent the soil being washed away, raising of shelter belts of growing trees to check

encroachment of the desert, mulch farming, bunding, terracing, gully plugging and check damming, hardly needs emphasis.

On the recommendations of the Planning Commission, notable progress has been made in the initiation, organization and co-ordination of soil conservation research, training and action programme on the national level. The Central Board has given technical and financial assistance to the State Governments to develop a sound programme of soil conservation. According to a working concept set by it, soil conservation includes all soil and water management practices that are needed to attain sustained production of cultivated crops, grasses and trees at the highest practical level.

With the experience gained during the Second Plan and a larger number of persons trained in soil conservation, development work during the Third Plan was stepped up considerably. An outlay of Rs. 72 crores was provided for the execution of various programmes and specific targets laid down under different schemes. There was emphasis during the period on additional training facilities for a successful completion of the Plan targets. It was visualized that people's participation in this programme was necessary. Mobilization of local leadership and other measures, therefore, formed an integral part of the Plan. Suitable legislation empowering State Governments to frame soil conservation schemes for the basin of a river or a stream or for groups of villages was recommended.

In the Fourth Plan, soil conservation programmes in conformity with the new approach of integrated Watershed Work Plans and Area Saturation, was adopted. The more important of the soil conservation measures on which greater emphasis was laid included control of soil erosion, protection of land against all forms of soil deterioration, improvement of physical conditions of land, rebuilding of soil fertility, conservation of soil moisture for crop use, proper management practices, etc. Till the end of 1969-70, an area of about 11 million hectares had been treated with soil conservation measures at an estimated expenditure of Rs. 215.2 crores. The programmes of soil and water conservation were taken up in different rainfall zones and special attention was given to land development in dry land farming areas with scanty rainfall as well as creating employment opportunities in such areas.

**Work in Catchments of River Valley Projects:** The centrally sponsored programmes of soil and water conservation in the catchment of 13 major river valley projects are being intensified in order to prolong the life of the multi-purpose reservoirs which are beset with the problem of high rate of sedimentation. The works were concentrated particularly in watersheds where there was evidence of accelerated erosion. In addition, soil conservation programmes were

initiated in 8 additional river valley projects. In such areas, about 0.1 million hectares were covered during 1970-71. Various measures taken in the river valley project areas are expected to conserve the water storage capacities of irrigation schemes. This centrally sponsored scheme is being executed by the Agriculture and Forest Departments in the respective States. Some State Governments are also undertaking similar programmes with their own resources. The Governments of the Punjab and Bihar have established Soil Conservation Directorates for working the programme under the centrally sponsored and State Sector Schemes. Implementation of both schemes has helped in creating additional employment opportunities for about 12 crore man days.

**Ravine Reclamation :** Under the Centrally sponsored scheme of pilot projects in Gujarat, Madhya Pradesh, Rajasthan and Uttar Pradesh, an area of 1,200 out of 8,000 hectares is estimated to be reclaimed during 1970-71 at a total cost of Rs. 30 lakhs. The objective of this scheme is to determine the technical and economic feasibility of large scale ravine reclamation. The experience gained in the execution of pilot projects is expected to be utilized by the respective State Governments for taking up large scale ravine control and reclamation works.

**Soil Survey :** The All-India Soil and Land Use Survey Organization under the Ministry of Agriculture is conducting a standard soil survey in the catchments of 13 river valley projects. The purpose of these surveys is to provide basic information on priority areas for planning and execution of various soil conservation measures. Some soil surveys are also conducted outside the catchment area to find out the suitability of land for agricultural purposes. It is estimated that 2.75 lakh hectares would be surveyed in the catchment areas. Aerial photo-interpretation work has also been initiated in the newly selected 8 river valley projects for the purpose of erosion assessment in these catchments.

In order to establish potential areas for economic agriculture, a centrally sponsored scheme of soil survey in 5 innovative IADP districts, namely, Ludhiana, Sambalpur, Raipur, West Godavari and Thanjavur was initiated during 1969-70. A target of 8 lakh hectares fixed for 1970-71—4 lakh hectares detailed soil survey and 4 lakh hectares reconnaissance soil survey—is likely to be achieved during the year at a total cost of Rs. 7.5 lakhs.

**Resources Inventory Centre :** The Resources Inventory Centre set up in 1967-68 is engaged in collection, correlation and presentation of available data through maps, charts and reports and highlighting information gaps. Relevant data on soil, water, vegetation, land use and climate are the main disciplines on which the data are being

collected and presented. A technique of sample surveys to enable a quick inventory of land resources has been tested in Indore district and is being refined for wider application. A tentative study on criteria for nation-wise delineation and codification of watersheds has also been initiated.

**Other Aspects :** A central unit for Soil Conservation (Hydrology and Sedimentation) started functioning during 1970-71 for the collection and correlation of hydrological and sedimentation data with a view to evolving standard design procedures to be used in priority determination and work plan development for the catchments of river projects and other schemes.

**Integrated Development of Dry Land Agriculture :** The breakthrough in agriculture, which has been achieved in irrigated and assured rainfall areas through the introduction of high yielding varieties and multiple cropping has to be extended to dry areas. Accordingly, a centrally sponsored scheme for Integrated Dry Land Agricultural Development was launched in 1970-71 for implementation during the remaining period/term of the Fourth Five Year Plan. The approach of the scheme consists of (i) intensive research for evolving techniques which will give maximum returns and (ii) practical application of the available knowledge on soil and moisture conservation practices; cultivation of drought tolerant and short duration photo-insensitive varieties of crops, new techniques of fertilization, etc., under pilot project.

It is proposed to take up 24 pilot projects under the scheme which would be training-cum-demonstration projects. To begin with, 9 such projects were initiated during 1970-71 in Andhra Pradesh, Gujarat, Haryana, Madhya Pradesh, Maharashtra, Karnataka, Rajasthan, Tamil Nadu and Uttar Pradesh. Advance action has also been initiated to establish the remaining 15 pilot projects during 1971-72. In view of the special nature of this programme and due to the weak economic position of the farmers, special incentives have been provided. These include subsidies and loans for inputs as well as for permanent works at least in the initial stages. The scheme takes care of infrastructure requirements like demonstrations, farmers' training, use of improved implements, foliar spraying of urea and pesticides, sprinkler irrigation and suitable animal husbandry programmes. Care is taken to ensure that the investment is related to likely returns.

## VI. Land Policy

An ideal land system should aim at ensuring the most productive use of land without any damage to it and loss of fertility in the long run. This means that the tiller of the land should enjoy full

security over the land held by him provided he assumes responsibility for its proper maintenance and cultivation. The system of taxes and rent, if the land is not owned, should assure a reasonable reward for his labour and expenditure. There should be necessary incentives and sanctions for investment on improvements in land. Keeping this in mind, it is proposed to examine the land policy from 1947.

**Pre-Independence Legislation :** In the pre-independence era, piecemeal attempts were made for eliminating some of the worst features of land tenure. The former Government of Bombay enacted in 1938 a law creating a class of protected tenants who could not be evicted except for non-payment of rent and such specific reasons. Rents were also reduced. In Bihar, all rent enhancements between 1911-13 were cancelled and illegal evictions by the zamindars were made a penal offence. In the United Provinces, as Uttar Pradesh was then called, a moratorium was declared on all arrears of rent and debts, and ejectments of tenants were prohibited. When the U. P. Tenancy Act of 1939 came into force, permanent and heritable occupancy rights were given to 7 million tenants over an area of 66 million hectares.

**Land Pattern on the Eve of Independence :** Various interests in land on the eve of independence fell into four classes : (1) cultivating holders ; (2) intermediaries—non-cultivating holders ; (3) tenants-at-will ; and (4) agricultural labourers.

Cultivating holders may be classified into two categories—owners and tenants. If the owner cultivates the land himself, there is no other person holding interest in his land above or below him and between him and the State. As against this, tenant holders do not have any ownership rights in land. They may more appropriately be described as 'occupancy tenants' to distinguish them from the 'tenants-at-will'. They have no direct relation with the State, but there is a chain of intermediaries. Land tilled by them may have any number of interests above them.

Intermediaries are either non-cultivating owners of land or non-cultivating occupancy tenants. In the Zamindari areas, all interests above the occupancy tenant and below (if he himself was a non-cultivator) can be termed as intermediaries. In the ryotwari areas, owner-holders, not cultivating the land themselves, are intermediaries. They pay a fixed revenue to the State and receive higher rents. As in the case of Bengal, there could be as many as 15-20 intermediaries between the State and the actual tenant or the tiller of the soil.

A tenant-at-will cultivates the land and bears its cost of cultivation. He may or may not have any security of tenure. The land tilled by him can have any number of interests above him. His rights

on the land also differ from region to region. Invariably his interest is not permanent and heritable. But there are examples like those of Bihar, where even the under-ryot, the man at the bottom, can also acquire occupancy rights by a continuous possession of land for twelve years. Agricultural labourers constitute the mass of unemployed and underemployed landless population in the villages. Very few of them are able to secure permanent employment. Some cultivate small parcels of land and may even own the plots but their major source of living is the wages earned. This class always exerts great pressure to obtain land for cultivation.

**Land Reforms in Post-Independence Era :** On the eve of independence, the social, economic, and political thinking was very favourable for land reform measures, rather the various political groups vied with each other in advocating an overhaul of the land system which would benefit the small holders and landless population. The First Five Year Plan stated that the increase of agricultural production represented the highest priority in planning over the next few years, and agricultural economy had to be diversified and brought to a much higher level of efficiency.

In this context, it was necessary to remove the impediments to agricultural production. Opinion was growing that the first requisite for better farming was a change in the character of the agrarian structure in India. An irrational agrarian relationship could be responsible for (1) a large share of the produce being paid as rent, leaving little incentive to the poor cultivator to increase output; (2) reducing the margin of saving for investment on land or its efficient cultivation in the case of the majority of tenants who are small holders; (3) lack of security of tenure, even in the case of well-to-do farmers and, therefore, no incentive to improve production or invest on land improvement; and (4) no interest in investing on land improvement on the part of absentee landlord who normally has other sources of income as well.

More than a business proposition, agriculture in India is a way of life for more than seventy per cent of the people. No Government wedded to a welfare programme could be indifferent to the status of millions who depend on land. Protection against exploitation, security and equality of status and opportunity among different sections of the rural population, were accordingly accepted as national policy.

**Objectives of Land Policy :** Broad objectives of land reform measures under implementation and formulation in the country may be summarized as follows :

- 1. (1) Land to the tiller,

- (2) Augmentation of agricultural production by a better system of land management.
- (3) Reduction of inequalities in opportunities and income.
- (4) Improvement in the position of agricultural workers.
- (5) In general, the raising of living standards in rural areas.

For the fulfilment of these objectives, major steps adopted under the programme are :

- (1) Abolition of intermediaries.
- (2) Regulation of landlord/tenant relationship by fixing fair rents, conferring security of tenure on tenants subject to the landlord's right to resume a limited area for personal cultivation, bringing tenants into direct relationship with the State in respect of areas which the landlord is not entitled to resume and gradual conferment of ownership rights on the tenants.
- (3) Redistribution of land by placing ceilings on future acquisition and existing holdings and acquiring surplus areas above the ceilings, resettlement of landless agricultural workers and increasing the size of uneconomic holdings.
- (4) Consolidation of scattered holdings into compact blocks and prevention of fragmentation and diminution of holdings below an economic size.
- (5) Development of co-operative farming by which small holdings will be pooled and cultivated jointly to increase the size of the operational unit and benefit from economies of large-scale organization leading ultimately to co-operative village management.

**Abolition of Intermediaries :** The abolition of intermediaries, though having wider objectives of social equality and economic advancement of the tenant class, gained considerable support when legislation failed to regulate the relations between landlords and tenants. Enactments for the abolition of intermediaries were undertaken in certain States before the formulation of the First Five Year Plan. But most of the work relating to enactment of laws and acquisition of intermediary titles was done during the period of First Plan. Zamindari Abolition Acts were passed in Uttar Pradesh, West Bengal, Madhya Pradesh, Patiala and East Punjab States Union (PEPSU), Rajasthan, Saurashtra and Delhi. Intermediary rights in the States of Uttar Pradesh, Bihar, Punjab and West Bengal have now been completely abolished. Except for a few minor tenures, legislation has been enacted in other States.

**Compensation :** Since no property can be acquired by the State without compensation to the owners under the Constitution, all Acts for abolition of the rights of intermediaries provide for payment of

compensation and indicate the principles according to which and the manner in which, compensation has to be determined. It is computed on the basis of 'net income' in Assam, Bihar, Madhya Pradesh, Orissa; on 'basic annual sum' in Tamil Nadu and on 'net assets' in Uttar Pradesh.

The 'net assets' and 'net incomes' are calculated by deducting from the usual aggregate incomes, accruing to the landlord from their estates, the aggregate of the expenses incurred by way of pay, cost of management, recoverable arrears of rent, etc. The basic annual sum (as in Tamil Nadu) is calculated on the basis of the gross annual ryotwari demand, average net income derived from *lanka* lands other than those in respect of which ryots of land holders are entitled to ryotwari *patta* and average net annual miscellaneous revenue derived from such sources as waste land, pasture land, forests, mines and minerals, rivers, quarries, fisheries, etc. Deductions are to be made on account of establishment charges, deficiency in collection, maintenance of irrigation works, etc.

Rates of compensation are fixed on a graded scale with higher multiples for smaller incomes and lower multiples for higher incomes. The multiple laid down is eight times in Uttar Pradesh and seven times in Rajasthan and parts of Madhya Pradesh. In Madhya Bharat, now part of Madhya Pradesh, the multiple is eight under the Zamin-dari Abolition Act and seven under the Abolition of Jagirs Act. In other States the sliding scales are as follows :

|                                     |                |
|-------------------------------------|----------------|
| Assam                               | 2 to 15 times  |
| Bihar                               | 2 to 20 times  |
| Tamil Nadu                          | 12 to 30 times |
| Madhya Pradesh (merged territories) | 2 to 10 times  |

In Uttar Pradesh, Madhya Pradesh, including the Madhya Bharat area, where compensation is to be determined at a flat rate, the State also pays a rehabilitation grant to the smaller intermediaries in addition to compensation. Small intermediaries are those who pay land revenue upto Rs. 10,000 in Uttar Pradesh and Rs. 3,500 in Madhya Pradesh including the Madhya Bharat area. For the Madhya Bharat area, it is further laid down that only proprietors who earn livelihood wholly or mainly from agriculture will get rehabilitation grants.

The main problem now engaging the attention of State Governments is the building up of the revenue agency and preparation of land records. In many States this has been completed. Action is still pending in States like Bihar and Orissa. In the country as a whole, about Rs. 320 crores has so far been paid as compensation, out of an estimated total of Rs. 570 crores including rehabilitation grants and interest.

**Payments made by Tenants :** The incidence of compensation to be paid to intermediaries has ultimately to fall on the tenants and sub-tenants. The State recovers rent from the tenants and pays compensation to the owners out of its increased revenues. Every effort has, however, been made to ensure that the total annual burden on cultivators to whom the lands are allotted does not exceed the fair level of rent. The object is to improve the status of the tenant by the purchase of superior proprietary or quasi-proprietary rights. The amount may be paid in lump sum or equated annual instalments. Since the amount of compensation to be paid to intermediaries is at much lower rates than the market price of land, it has been a gain for the tenants.

Not all the landlords in the country are descendants of former revenue farmers. A number of them actually purchased land and invested on its improvement. They belong to the genuine class of landlords as anywhere else in the world. But in the payment of compensation to them, under the various Zamindari Abolition Acts, it was not administratively feasible to make any distinction between those who acquired the title of landlords without any investment and those who invested on it their hard-earned wealth.

The outgoing intermediaries and the old classes of tenants under the terms of settlement would pay to the State the existing rates of rents or such fair and equitable rents fixed by the State Governments. In Assam and Tamil Nadu, fresh settlements on ryotwari basis would be introduced in areas taken over by the State, but, pending such settlements, rates of land revenue would be determined on the basis of existing rents or rates chargeable on similar lands. Under the Assam Act during the transitional period, the land revenue realizable would not exceed the rent which was payable by the ryot to the proprietor or the superior tenure holder immediately before the date of notification.

In Tamil Nadu, the land revenue would be equal to the rent which would have been payable to the landholder during *fasli* year in which the Act was notified.

All *Bhumidars* and *Sirdars* in Uttar Pradesh are jointly responsible to the State Government for the payment of land revenue. In the case of *Bhumidars* and *Sirdars*, land revenue is equal to the revenue of rent payable by them before the date of vesting. When *Sirdars* acquire *Bhumidars* rights on payment of the prescribed amount, they get a reduction of 50 per cent in the land revenue payable by them on the date of admission. The land revenue payable by *Bhumidars* would not generally be revised for 40 years after the commencement of the Act except on ground of increase or decrease in the area of their holdings.

Those who wish to purchase the ownership rights immediately have to pay a multiple of their annual rent. In Uttar Pradesh this is ten times and three or four times the present rent for absolute occupancy tenants and occupancy tenants respectively and six and fifteen times for occupancy tenants and sub-tenants respectively in the Madhya Bharat region of Madhya Pradesh.

The time lag between the enactments relating to abolition of intermediary rights and their implementation was used by a number of zamindars to evict the tenants so as to enlarge the size of *sir* and *khudkasht* holdings and have it classified in the village records as 'under personal cultivation'.

The so-called 'voluntary surrenders' reported on a large scale from various States, were actually 'forced evictions'. To curb this tendency, special acts and orders have been promulgated in States like Assam, Bihar, Tamil Nadu, Karnataka, Rajasthan and Delhi. These acts seek to protect the interests of tenants, check their eviction, and prohibit land transfers pending introduction of reforms. Some of these also contain provisions for the protection of trees, private forests, irrigation works, etc.

Suggestions have also been made that even where a surrender is registered, the landlord should be entitled to take possession of the land only to the extent of his right to resumption, the balance being taken over by the State. A few States have made provision for the review of voluntary surrenders. All these laws, however, seem to have failed to remove the harm already done.

Efforts have also been made by landlords at some places to circumvent the legislation by entering into mutual agreements with the tenants. The landlord pays full or part of the compensation to be paid by the tenant and takes possession of a portion of the land which would otherwise have remained with the tenant. In States like the former PEPSU State such an arrangement was declared as legally valid.

In spite of these evasions, the share of cultivated land directly settled with Government has increased considerably. Vast areas of waste-land and grazing grounds which belonged to the zamindars now belong to the village communities.

**Tenancy Reforms :** The intermediary abolition acts did not affect the tenants-at-will and other layers of non-occupancy tenants, ryots, under-ryots, share-croppers, etc. The object of tenancy legislation in India is to help this class of cultivators in the States where intermediary abolition acts have been passed and to define the tenure arrangements to ensure more productive use of land in the remaining areas where such legislation has not been enacted.

**Security of Tenures :** Legislation adopted in different States for tenancy reforms follows two broad patterns. Comprehensive legislation has been adopted in Assam, Maharashtra, Tamil Nadu, Jammu and Kashmir, Punjab, Rajasthan, Uttar Pradesh, West Bengal, the former State of Hyderabad, and the centrally administered Union Territory of Delhi, defining the tenure arrangements on the basis of the new social policy.

In Andhra Pradesh, parts of Kerala, Tamil Nadu, Karnataka, Orissa, and Bihar legislative action in this direction is only of a stop gap nature providing for stay of ejection and regulation of rent. More comprehensive legislation is in different stages of formulation in these States. The Madhya Pradesh Government has yet to initiate legislation for stay of ejection of tenants in what was formerly known as the Central Provinces. Provision has, however, been made for conferment of occupancy rights in lands which have been let out for three years or more in any consecutive period of five years.

**Resumption of Land for Personal Cultivation :** Experience has shown that land owners are liable to misuse the saving clause 'personal cultivation' and eject tenants. In order to ensure that only *bonafide* cultivators resume lands from tenants, the Second Plan imposed certain obligations on the owners and defined 'personal cultivation' to include: (1) personal supervision by the owner himself or by a member of the owner's family and in order that personal supervision may be effective, the owner or a member of his family must reside in the village in which the land is situated or in a nearby village within a distance to be prescribed; (2) the owner must bear the entire risk of cultivation; and (3) the owner or a member of his family should contribute personal labour to cultivate the land.

Tenancy legislation, practically in all the States, contains some of these clauses to define 'personal cultivation' but in none of the legislation area all the three clauses referred to above are enacted. The first and the second clauses have, for example, been enforced in Maharashtra, Rajasthan, and a number of other States. Assam, on the other hand, has introduced only the first one.

Certain safeguards have been provided for persons serving with the armed forces, unmarried women, widows, minors, and other persons suffering from mental or physical infirmities. Such persons enjoy the right to lease out land and to resume for personal cultivation when the disability ceases.

Some recommendations have also been made in the Second Plan about the area which the tenant can retain. It has to be equitably determined and demarcated by the authority and permanent and hereditary rights conferred on tenants in respect of non-resumable areas. In short, the interests of owners who wish to cultivate per-

sonally and of a tenant who may be deprived of his living on account of resumption, have to be reconciled.

Legislation adopted in various States, for the purpose, may be grouped under five heads. (1) In some areas such as Uttar Pradesh and Delhi, the landlord is not allowed to resume any land by ejecting tenants; and tenants holding land on a particular date are conferred permanent and heritable rights.

(2) In Maharashtra, Punjab, Rajasthan, and Himachal Pradesh, a tenant has the right to retain a minimum area or he gets an alternative area before he is ejected. In either of these cases, an upper limit on the resumption of land by the land holders is fixed. The upper limit varies from State to State.

(3) Though an upper limit on the resumable area is imposed there is no provision for the tenants to retain or obtain a minimum holding. Assam, Madhya Pradesh (Berar area), former Hyderabad area, Orissa, former PEPSU, Kutch, West Bengal and Jammu and Kashmir are in this group.

(4) Measures in the form of an order for staying ejection have been adopted in certain areas to give temporary protection to the tenants. These areas are Andhra Pradesh, Vidarbha area of Maharashtra, Kerala, Madhya Bharat, Bhopal and Vindhya Pradesh areas in Madhya Pradesh, Tamil Nadu, Karnataka, Orissa and Manipur.

(5) Finally, States where no upper limit for resumable area exists and the landlord has the right to eject the tenants at will. In other words, he can resume the entire area for personal cultivation. Here there is generally no security of tenure.

**Regulation of Rent :** The First Five Year Plan recommended that the maximum rent should not exceed one-fourth or one-fifth of the gross produce. Legislation for the regulation of rent has been adopted or is under progress in all the States. But there is great variation in the rates of rents fixed in the States. For example, in Maharashtra and Rajasthan, it is one-sixth of the gross produce. In Assam, parts of Karnataka, Orissa, Delhi and Himachal Pradesh, rents have been fixed at one-fourth or even less. In Jammu and Kashmir, Karnataka, Bihar and Punjab rents have been fixed at one-third of the gross produce. In a few States, rents have also been fixed as a multiple of land revenue.

Existing rates in some States, like Bihar, Jammu and Kashmir, Tamil Nadu, Karnataka, and Punjab, still exceed the prescribed limit under the First Plan. Steps are being taken to reduce them. In Madhya Pradesh and Saurashtra regulation of rents has yet to be taken up. The Report on the working of Bombay Tenancy Act, 1948, observes that share rents have remained unchanged whereas cash rents have shown no signs of reduction. On the contrary, it is found that on occasions when tenants were changed, there

have been more cases of enhancement than of reduction in the rent. In Gujarat, it is found that except for Broach, the level of rent was in excess of the legal ceiling. In this connection the Report says : "The socio-economic factors and traditions were powerful forces in determining the levels of rent and it will take time to overcome them to adjust the levels of rent to the statutory level of ceilings. In spite of the fact that maximum rents have been fixed in most of the States, the tenants' position remains more or less the same. It may be difficult to draw a general conclusion for the country as a whole, based on the experience of a single State, but all the same, this provides some indication of the situation prevailing in the country".

**Ownership Rights for Tenants :** Some sort of protection has been given to the occupancy tenants. But tenants-at-will had not been protected so far and they had no permanent rights in land. Recent enactment entitled both these types of tenants to acquire ownership of land under certain conditions.

The objective of bringing together in one person, the right to own and the right to use in respect of non-resumable area was thus proposed to be achieved. As stated in the First Plan, the present link between the tenants and rent receiving owners has to be removed and tenants brought into direct relationship with the State.

Various enactments in different States have made provisions to effect this change. The basis for determining the price of land which tenants wish to purchase and its mode of payment differ from State to State. Care has, however, been taken to ensure that the aggregate of the amount of payments of compensation does not exceed the level of rent recommended in the Plan.

Action taken by various States for transfer of ownership to tenants follows broadly the following pattern :

(1) All tenants have been brought into direct relationship with the State, as in Uttar Pradesh. The State recovers rent from the tenants and pays compensation to the owners out of its increased revenues. In Delhi, the tenants get full ownership rights and are required to pay compensation direct to owners in addition to payment of revenue to the Government.

(2) Tenants have been asked to buy ownership rights by a stipulated date, failing which they become liable to ejectment. The Bombay Legislation contains a provision along these lines.

(3) Tenants have been given optional right of purchase on payment of price, regulated by law and payable in instalments spread over a period. In States where legislation has been enacted for converting tenants into owners, about 34.39 lakh tenants and share croppers have acquired ownership of more than 31 lakh hectares.

**Redistribution of Land :** A major decision has been taken in favour of redistribution of land to fulfil the objectives of reduction of inequalities and more even distribution of economic power in a democratic-socialistic State. The following measures relate to redistribution of land to help landholders with uneconomic size holdings and landless persons :

- (i) Ceiling on Holdings
- (ii) Settlement Projects
- (iii) Bhoodan Movement

**Ceiling on Holdings :** A ceiling on the size of holdings means a statutory absolute limit on the total area of agricultural land that an individual may possess (in one or a number of units). It was proposed in the First Five Year Plan that a limit on the extent of land, an individual or a family should be allowed to hold, be imposed in all the States. In order to implement this suggestion, a census of land holdings and cultivation was undertaken. The Committee of the Panel on Land Reforms also recommended ceilings on the aggregate area held by a family. Land held in excess of that limit, it was proposed, shall be distributed among landless agricultural persons and those with uneconomic holdings. Various plans have reiterated the importance of implementing this decision at an early date and the Nagpur Resolution of the All India Congress Committee in January 1959, stated that legislation to this effect should be completed by the end of 1959.

**Objectives :** Ceilings on land can have broadly two objectives, viz., (1) social justice to level down the difference between the 'haves' and the 'have-nots', by reducing glaring inequalities in ownership and use of land as well as in agricultural incomes, and (2) increased production in the interest of the country as well as the individual by meeting the widespread desire to possess land and enlarging the sphere of self-employment.

It has thus been suggested that steps be taken to diffuse ownership to reduce tension in the country and provide an incentive for increased output. The Mysore Tenancy Agricultural Land Law Committee has gone further and suggests that ceilings may also be imposed in other sectors of the economy so that there may be no sense of grievance on the part of agriculturists.

Ceilings have thus to be viewed, not as an isolated measure, but as an essential part of a fully considered scheme of reorganization of the agricultural economy.

One of its primary objects is that land should be cultivated only by those who have complete interest in it. Fixation of ceilings would

remove all disinterested parties from the land. Surplus land, thus made available, can then be distributed among the landless. Past experience has been that generally, the large land holders did not pay proper attention to the cultivation of the entire land held by them nor did they make any investment on improvement of the land. Still they preferred to maintain their hold on the land. With their elimination, all classes remaining on land will cultivate their entire holding efficiently.

**Legislation on Ceiling :** Legislation on ceilings has been enacted in most of the States (Table XIII). It imposes either a limit on future acquisition, *i.e.* no one can increase the area held by him beyond the limit imposed by the ceiling fixed for the region, or a limit on the size of existing holdings, *i.e.* the land in excess of the ceiling will be acquired by the State.

TABLE XIII  
Land Ceiling in States

| States            | Future Acquisition   | Existing Holdings   |
|-------------------|----------------------|---------------------|
| Andhra            | 11.5 to 106 Hectares | 110 to 132 Hectares |
| Assam             | 20.4 „               | 20.4 „              |
| Bihar             | 8 to 24.5 „          | 8 to 24.5 „         |
| Gujarat           | 7.7 to 53.5 „        | 7.7 to 53.5 „       |
| Jammu and Kashmir | 9.7 „                | 9.7 „               |
| Kerala            | 6.1 to 15.3 „        | 6.1 to 15.3 „       |
| Madhya Pradesh    | 10.2 to 30.5 „       | 10.2 to 30.5 „      |
| Tamil Nadu        | 9.7 to 40.7 „        | 9.7 to 40.7 „       |
| Maharashtra       | 4.9 to 34.2 „        | 7.3 to 51.3 „       |
| Karnataka         | 7.3 to 58.6 „        | 11.0 to 87.9 „      |
| Orissa            | 8 to 32.6 „          | 8 to 32.6 „         |
| Punjab            | 12.2 Standard „      | 12.2 Standard „     |
| Rajasthan         | 12.2 Standard „      | 12.2 Standard „     |
| Uttar Pradesh     | 5.1 „                | 5.1 „               |
| West Bengal       | 10.2 „               | 10.2 „              |
| Manipur           | 10.2 „               | 10.2 „              |
| Tripura           | 10.2 to 30.5 „       | 10.2 to 30.5 „      |
| Himachal Pradesh  | 12.2 „               | 12.2 „              |

**Bhoodan Movement :** It is a non-official movement under the leadership of Acharya Vinoba Bhave. The movement for voluntary land gift has the sympathy and support of the Congress, the present ruling party. Describing the aims of the movement, Acharya Bhave, said : "In a just and equitable order of society, land must belong to all. That is why we do not beg for gifts but demand a share to which the poor are rightly entitled. The main objective is to propagate the right thought by which social economic maladjustment can be corrected without serious conflicts."

In its practical application, *Bhoodan* takes the shape of asking for voluntary donations of one-sixth of the land from owners for redistribution among the landless. In the non-agricultural sector, the movement assumes various forms such as *Sampattidan* (donation of money or other resources), *Budāhidan* donation (donation of mental abilities) and *Jivandan* (donation of life).

**Progress under Bhoodan:** The movement which began on a modest scale on April 18, 1951, now covers the length and breadth of the country. The initial target was to obtain 20 million hectares of land so that it may be possible to provide some land for cultivation to every rural family. Total collections so far have been only 1.7 million hectares under the movement. Of this, only 5 million hectares have been distributed among the landless. There are quite a number of snags in redistributing the land so collected. In a number of cases, the Government did not have proper land records and about 40 to 50 per cent of the land collected was fallow. The progress of the movement is actually very slow for the last few years when hardly any new land has been collected.

In 1965, Vinobaji launched a programme *Toofan Gram Dan*, a whirl-wind campaign to collect gifts of whole villages in Bihar. The ideal was that all land should belong to the village community as a whole. Following this call, as many as 41 thousand *Gram Dan* have been made in Bihar, a State which was fast heading towards the achievement of a complete 'State *Dan*'. Bihar, Tamil Nadu, Orissa, Madhya Pradesh, Uttar Pradesh, Maharashtra and Rajasthan Governments had already pledged full co-operation to *Sarvodaya* workers in bringing these States within the purview of the *Gram Dan* Movement during the Gandhi Centenary Year.

As in the case of land donated under *Bhoodan*, the land received in over 1 lakh *Gram Dons* has also to be legally transferred in the name of the *Gram Sabhas*. *Sarvodaya* workers have not yet concentrated on the functioning of the *Gram Sabhas*, but they were only trying to collect as many *Gram Dons* as possible.

The implementation of the whole *Sarvodaya* programme would be carried through *Gram Dan Sabhas* after they have achieved a few *State Dons*.

The *Gram Dan* Movement aims at achieving a total rural revolution through peaceful means. It was also an educative process to educate the rural people about the value of collective ownership and forewarning them against the vested interests of landlords and untouchables. In that sense, it was a silent revolution which was bound to have social and political repercussions in the near future. There was urgent need for evolving a way for a village oriented economy. The present official plan and policy of development were business

oriented. *Gram Swaraj* would completely reverse this process and the *Gram Sabhas* would work for an agro-industrial self-reliant economy which would progressively eliminate exploitation of the masses and disparity in incomes. The village oriented economy would be an economy of sharing, as distinguished from the economy of a competitive market. This calls for decentralization of power giving villages some autonomy.

It is very difficult to say at this stage how far these ideals will be achieved. Although much of the land that has been donated is reported to be unfit for cultivation, the area of land made available through *Bhoodan* is no way insignificant as compared with the land to be acquired through legislation on ceilings. A more significant point to be stressed is that such a large area of land has been given as a free gift even when the position with respect to the availability of land is not at all comfortable and the majority of Indian farmers are themselves small holders. Judged in this way, it is certainly a great success. Even the worst critics of the movement have no hesitation in agreeing that the achievement has no parallel in the world.

**Land Management Legislation:** The First Five Year Plan recommended that individual owners should conform to standards of efficiency determined by law in the cultivation and management of land. In their application, these standards were thought of, in the first instance, in relation to large holdings. In the Second Plan it was suggested that standards of efficiency and management would apply to all holdings.

The Committee of the Panel on Land Reforms recommended that all farmers should be obliged to maintain reasonable standards of production and preserve and develop the fertility of the soil. There should be land management legislation to provide necessary incentives and sanctions for the performance of this obligation. Implementation of the legislation at the village level should be undertaken generally through village panchayats, but suitable arrangements for supervision would be necessary.

The purpose of land management legislation as envisaged by the Panel on Land Reforms may be classified broadly as follows :

- (1) To provide for cultivation of all land suitable for cultivation.
- (2) To ensure proper standards of cultivation.
- (3) To ensure collective or group adoption of certain practices.
- (4) To enforce changes in cropping pattern and introduce new combinations of enterprises, e.g. mixed farming.
- (5) To participate in co-operative societies.
- (6) To provide incentives.
- (7) To take punitive action.

The main purpose of the management legislation by itself is to instil a sort of fear of punitive action in the minds of farmers in case they failed to adopt improved management practices.

Because of difficulties in determining the output, the norms suggested relate to the adoption of improved practices. In some States, powers have been acquired under which the authorities can ask the owners of waste and fallow land to bring them under cultivation. In case of default, the Government would lease them out to tenants for a number of years. Assam and Madhya Pradesh have increased assessment on waste lands so as to induce the owners to put such land under the plough. Again, management of estates in certain cases can be taken over by the Government. In Maharashtra, if land is not properly cultivated or is lying uncultivated for any two seasons, whatever the reasons, the Government can assume management immediately. Government may also take over land when it considers necessary for the purpose of improving the economic and social condition of peasants.

**Recent Changes :** Many State Governments have recently been trying to reduce the ceiling on holdings. Tamil Nadu announced a reduction of ceiling of land holdings from 12.14 to 6.07 standard hectares. This was resisted by land owners in Thanjavur district. After the first Land Ceiling Act was enacted in 1961, only 26.30 thousand hectares out of 103.60 thousand hectares said to be surplus were notified ; of this only 3.2 thousand hectares were assigned to tenants. If the ceiling is reduced to 4.05 hectares as proposed a further surplus of 81, thousand hectares will be made available. If implemented, this will deprive 45 thousand land owners of their land to benefit only 40 thousand at the rate of 2.02 hectares each.

Besides Tamil Nadu, the ceiling, at present varies from the absolute area limit of 6.07 to 15.17 hectares in Kerala, 12.14 standard hectares in Rajasthan and Punjab, 10.92 to 131.12 hectares in Andhra Pradesh and 16.19 hectares in Uttar Pradesh. The Central Land Reforms Committee which had long been examining this question recommended a ceiling of 4.05 to 7.29 hectares with assured irrigation and 4.05 to 21.85 hectares of unirrigated land for a family of five.

Generally, the level of ceiling is the lowest for land with assured irrigation and highest for dry farming. In Tamil Nadu, the level depends upon the rate assessment while in Haryana and Punjab the criterion adopted is the gross yield. In Uttar Pradesh, the ceiling is based on the hereditary rent rates prescribed at the time of settlement of resettlement. The case has been made out with the application of a ceiling on family basis to provide an effective check against clandestine transfer of land to members of the family with a

view to evading the ceiling laws. The ceiling is, therefore, to apply to the aggregate area held by all members of a family and the family is defined as one which includes the husband, wife, their children and grand-children.

The Central Land Reforms Committee will also consider the suggestion that transfers made after the prescribed date of any new ceiling laws should be void or be disregarded in order to prevent *benami* transfers. The States have their own laws on land transfer which give enough opportunities to the holders for manipulation within the laws. Most of the States have exempted land used for cash crops from the existing ceiling with the result that a large number of landlords have switched over to this type of crop. There is no ceiling in Madhya Pradesh on mechanized farming, while in Andhra Pradesh, Assam, Bihar, Madhya Pradesh, Karnataka, Orissa, Uttar Pradesh and Punjab sugarcane farms operated by sugar factories are exempted from ceiling.

The Committee will, therefore, discuss the application of uniform ceiling laws for lands growing cash crops or mechanized farms. Land held by religious, charitable and educational trusts will also come under review.

In Andhra Pradesh, so far, 567 hectares of land have been taken over but not distributed. Assam has acquired nearly 30,000 hectares of surplus land but has not so far framed rules to implement the reduced ceiling level. In Bihar, no land has been declared surplus. Haryana has distributed only 22,000 hectares of the 70,000 hectares declared surplus while in Maharashtra 25,032 hectares of land out of 117,437 hectares declared surplus have been distributed. There have been reports of large-scale manipulation from Maharashtra.

There are similar reports from other States of non-distribution of land. The Committee is likely to go deeper into the causes which have prevented these States in implementing ceiling laws or delaying the distribution of surplus land.

Implementation of the recommendations of the Central Land Reforms Committee is likely to meet with resistance from many areas where pressure groups have grown.

The inadequate implementation of the agrarian reforms came under criticism recently. The Conference of Chief Ministers on Land Reforms in 1970 came to the conclusion that the biggest problems in implementing the land reforms measures were sub-tenancies, land records, level of ceiling on land holdings, payment of compensation to landlords and intermediaries, landless agricultural labourers, provisions of the Constitution of India and recourse by landlords to courts

of law. After detailed discussions, the following decisions were taken :

1. Abolition of all intermediaries to be completed by December 1970, in all the States.
2. State Governments to expedite the completion of making up-to-date record of rights.
3. To enact legislative provisions to make resumption of land by landlords difficult.
4. To expedite the implementation of the programme of consolidation of holdings.
5. To set up a committee at the Centre with the Agriculture Minister as chairman to watch the progress in the implementation of land reforms.
6. To set up similar State committees under the chairmanship of the Chief Ministers.
7. Common services like making available tractors to the community, should be provided for a block of say 80.94 hectares allocated to landless labourers.

**Review of Progress :** A review of the progress of land reforms reveals that progress is neither uniform nor complete in the States.

For instance, legislation enacted for the abolition of *inams* in Andhra Pradesh is yet to be implemented in the Telengana area. The *muttadhari* tenure is still to be done away with by law. Land declared surplus so far has not been taken possession of by the State for distribution. Similarly, in Bihar the sharecroppers (*bataidars*) who hold land on oral lease and are generally not recorded, do not enjoy security of tenure. No surplus land has been taken possession of for distribution. In Tamil Nadu, tenants of landowners holding more than 5.39 hectares of wet land or its equivalent have been given protection but other tenants are liable to eviction from half of their holdings on grounds of resumption by landowners for self cultivation. Comprehensive tenancy legislation is yet to be enacted. In Karnataka, provision has been made for bringing tenants of non-resumable land into direct relationship with the State; but this provision is yet to be enforced. Also pending enforcement is a provision fixing ceiling of 10.92 to 87.42 hectares on existing holdings and of 7.29 to 58.28 hectares on future acquisitions, depending on the class of land. In Orissa, the provision for ceiling on land holding at 8.09 to 32.37 hectares has not been enforced, so far. In Punjab, there is no ceiling on ownership. The Government has, however, been empowered to settle tenants on land cultivated by a person in excess of the permissible limit.

The landlord's right of resumption in Punjab and Haryana is

subject to the condition that the tenant is given alternative land upto the prescribed limit for cultivation. In other States, the tenants and sharecroppers have only interim protection.

Legislation for security of tenure has been passed in most of the States. While in some States like Uttar Pradesh, no resumption was permitted to landlords and tenants have substantial rights in respect of their entire holding, in other States, such as Gujarat, Orissa, Maharashtra, Kerala, Madhya Pradesh, Rajasthan and Manipur and Tripura, landlords were permitted to resume land for personal cultivation within a specified period in certain cases; in respect of the remaining area, the tenants got substantial rights. In Rajasthan, steps are yet to be taken for acquisition of surplus land. Ceiling on land holdings varies from 8.9 to 135.98 hectares. In West Bengal, a landowner may resume the entire area leased to a sharecropper if he owns less than 3.03 hectares and two-thirds of the area in other cases. Pending finalization of comprehensive proposals with regard to *bagadar*, eviction proceedings have been stayed.

The Central Land Reforms Committee is again seized of this question and has been examining the various aspects for quite some time. Although the land grab movement organized by the left parties during 1970 failed, it highlighted the fact that the wave of unrest is bound to rise. This is the view expressed in the World Bank's Annual Report on the Indian Economy placed before the Aid Club Meeting in Paris during June 1970. According to the Bank Report, first priority should be for a tenancy reform programme, centred on rent ceilings and security of tenure. It also urges enhancement of land revenue, and the taxation of larger incomes from farming at par with incomes derived from other sources.

Taking note of the long-term implications of farm mechanization, the report argues that items like tractors and harvesters should bear a higher tax, not only to augment the Government's revenue but also to make the mechanization process "bear some of its real economic costs."

## VII. Unit of Cultivation

India is a country of small farmers, but not necessarily of small farms. This apparently paradoxical statement may be explained by the fact that 81.65 per cent of operational holdings are below 4.05 hectares, as much as 60.63 per cent of the land is cultivated in units of more than 4.05 hectares each.

The all-India average size of agricultural operational holding is 2.65 hectares. The average for different States varies considerably. Thus, at one end, Kerala has an average of 0.7 hectares and at the other Rajasthan has the highest average of

5.58 hectares. As a result of the growth in population and also of the land reform measures adopted since independence, several significant changes have taken place in the agrarian structure. The average size of agricultural operational holding has declined from 3.05 hectares in 1953-54 to 2.65 hectares in 1959-60. The 1961 Population Census records 2.99 hectares as the all-India average size of holding. The number of holdings below 2.02 hectares and the aggregate area comprised by them have increased during the period, the latter increasing at a relatively higher rate. At the other end, holdings of 20.23 hectares and above have declined in number and the area occupied by them has come down by as much as 30 per cent.

Nearly one-fifth of the holdings are below 0.46 hectares. But cumulatively they occupy only 1.59 per cent of the total cultivated area. At the other extreme, a little over one per cent of total operational holdings are of the size-group of 20 hectares and above, but they occupy as much as 12.13 per cent of the total area. It should, however, be noted that the size-groups of the holdings do not necessarily indicate their economic worth. The average size of holdings is generally small in areas where the yielding capacity of land is more because of assured rainfall, irrigation facilities, better quality of soil, etc. Holdings in such areas tend to get divided because a hectare of land with a relatively high yielding capacity is able to sustain more persons than an area whose yielding capacity is low. It has been shown that an inverse relationship exists between the yield per hectare and the average size of holding.

The numerical preponderance of small farms is thus essentially a consequence of excessive pressure of population on land and under-development of economy, rather than an excessive concentration of ownership.

A holding in agricultural parlance means the total area under ownership or operation of a farmer. A holding, however, rarely consists of a single compact farm. Usually, it comprises of several plots or fragments as they are called in India. The extent of fragmentation by size-groups of holdings is given below :

TABLE XIV  
Estimated Number of Fragments per Operational  
Holding and Average Area on Each Fragment

| <i>Size-group<br/>(hectares)</i> | <i>No. of fragments<br/>per holding</i> | <i>Average area of<br/>fragments (hectares)</i> |
|----------------------------------|-----------------------------------------|-------------------------------------------------|
| Upto 0.20                        | 1.61                                    | 0.06                                            |
| 0.20—0.40                        | 2.82                                    | 0.10                                            |
| 0.40—1.01                        | 4.41                                    | 0.15                                            |
| 1.01—2.02                        | 6.30                                    | 0.23                                            |

Legislative measure for consolidation of fragments have been enacted in all States (Table XV). Consolidation of holdings has been completed in Punjab and Haryana. The work has been largely completed in 45 out of 54 districts in Uttar Pradesh.

TABLE XV  
Progress of Consolidation of Holdings

| State             | Level achieved cumulative |         |         | Area ('000 hectares)  |                           |                                |

\*Includes progress prior to April 1951

\*\*Work completed

Consolidation of fragments, however, does not solve the problem of small holdings. It makes the operation of the existing holdings more economic. The problem of small holdings can be tackled at two different ends. First, further division of small holdings can be prohibited. Legislation for this has been enacted in several States, but for a variety of reasons—mainly the inheritance laws and lack of alternative occupations for descendants who are denied the share—implementation of the legislation is not effective. At the other end, small holdings may be pooled for the purpose of joint cultivation. This system has certain distinct advantages; economy in the use of bullock power, improved credit-worthiness, capital formation through joint labour, etc. It, however, does not alter the adverse man-land ratio. With the increase in the size of cultivation unit, there would be economy in the use of labour and disguised unemployment will become open and apparent. In spite of repeated policy decisions to encourage co-operative joint farming, efforts in the direction have not yet yielded demonstrable results.

As on 30, June 1969, there were nearly 8,165 co-operative farming societies with a membership of 2.2 lakhs and covering an area of 4.18 lakh hectares. Of these, the number of joint farming societies was 5,300 with a membership of 1.2 lakhs and covering an area of 2.54 lakh hectares. The task is admittedly very difficult coming up as it does against strongly rooted social and psychological attitudes. In the ultimate analysis, the problem of small holdings will not be solved and may become even more acute—until a large percentage of rural population can be provided with non-farming occupations. This is the major task of economic development.

**Legislation on Consolidation of Holdings :** The legislation on consolidation of holdings in India has passed through three stages since its inception. In the first stage, it was wholly permissive and was aimed at facilitating transfers and exchanges mainly through the offer of some concessions and with the help of trained staff. The initiative to consolidate the small and scattered holdings was left to farmers themselves. Co-operative societies were encouraged to take up consolidation work with the help of the staff under the Co-operative Department on voluntary basis. As no commendable progress was made through these legislations, an element of compulsion had to be introduced in the second stage. The Central Provinces Consolidation of Holdings Act, 1928, for example, authorized the consolidation officers to confirm and implement a scheme of redistribution of holdings, when not less than one-half of the permanent land holders holding not less than two-thirds of the occupied areas, agreed to it. Such a scheme would then become compulsory and binding on all the permanent right holders in the

village. Similarly, if two-thirds of the tenure holders in a village apply for consolidation the application would be considered as one made on behalf of all the tenure holders in the village. The Uttar Pradesh Consolidation of Holdings Act, 1953, provided for compulsory consolidation at the initiative of the State.

The enactment of the Bombay Prevention of Fragmentation and Consolidation of Holdings Act, 1947, marked the beginning of the third stage in the consolidation legislation in the country. This Act provides for a greater element of compulsion in the enforcement of a scheme of consolidation in any given area regardless of the willingness or otherwise of the land holders of the locality. But at each stage of the consolidation programme, objections from the people affected are given due consideration by the Consolidation Officer. Though the timings of the three stages were different in various States, at present compulsory consolidation is accepted as the common policy objective in most of the States.

The broad frame-work of the consolidation programme has been the same for all the States, but within it there are many minor differences in the methods and the procedures and the administrative set up as well as in regard to recovery of the cost of consolidation. A noteworthy feature of consolidation programme of Punjab is that the object of consolidation in this State is not merely to consolidate small and scattered holdings into compact blocks, but also of replanning into compact blocks. It seeks to co-ordinate all-round developmental activities in the villages reserving sites for schools, playground, *Panchayat Ghar*, etc. Circular roads skirting the village and roads linking different villages are also laid. Thus it may be said that in Punjab consolidation truly forms part of a comprehensive plan of rational lay out of land surface. In Maharashtra, part of former Bombay State, incentives are provided in the form of various concessions to agriculturists whose lands are consolidated to enlist their participation. To enable the poor agriculturists to pay compensation that may become due from them on account of consolidation work, *taccavi* loans are advanced.

In order to encourage the States to expand their programmes for consolidation to the maximum scale administratively feasible, the Ministry of Agriculture provides assistance for consolidation work as part of the Grow More Food Programme. This amounts to 50 per cent of the net expenses incurred by the State Government, subject to an overall maximum of 25 per cent of gross expenditure on consolidation.

However, the programmes of consolidation work could not be extended to the entire area in all the States due chiefly to the inadequacy of the administrative machinery. It was, therefore, thought

advisable to give priority to those areas which have irrigational facilities, adequate rainfall or the areas which are likely to come under irrigation works. This shift in policy, though encouraged and expedited consolidation work in the selected areas, has not been successful in accelerating the consolidation programmes as a whole.

**Consolidation Problems and Prospects :** During the operation of the consolidation programme during the last decades, several problems of practical importance have been noticed. These relate to the land records and administrative procedures. Preparing proper revenue records for the whole country is a stupendous task. But its absence has delayed the consolidation programmes to such an extent that as many as 10 to 15 years were taken to finish the consolidation work in some villages. Special legislative measures have been taken to expedite completion of land records.

The sentimental attachment of the cultivators to their ancestral land has rendered the exchange of land very difficult in many cases. There is also the psychological tendency of assessing the value of one's own land at a higher rate than that of others.

Recent thinking in the Planning Commission is that consolidation of holdings must be made compulsory under law. Prior to consolidation, the entire land in each village should be topographically surveyed and levelled to receive water wherever it is available, and irrigation channels and drains constructed for the entire village. If there is potential for additional minor irrigation (ground or surface) works these should be constructed, and in dry villages without any potential for water distribution, land levelling and counter bunding for soil and moisture conservation be effected. The laying of feeder roads will also be tried to the land development programme. The developed land should be so distributed among the owners that each one of them has his holdings in one or at the most two pieces.

The maintenance and operation of the works constructed as part of the integrated programme may be the joint responsibility of the State and the panchayats. Compulsory consolidation works must have affected million hectares of land which are envisaged to receive new irrigation benefits from the major, medium and minor irrigation schemes provided for in the Fourth Plan.

The expenditure involved in integrated programme covering 8-10 million hectares will be about Rs. 200 crores over a five year period and most of the resources for the purpose can be raised by diverting part of the allocations for agriculture, irrigation, flood control and rural electrification already made in the Plan.

### VIII. Agricultural Practices and Techniques

Transforming traditional agriculture into a progressive one through improvements in cultivation practices and techniques is a complicated process; results are slow and imperceptible. After World War II, a beginning was made under the Grow More Food Campaign to attempt a breakthrough. These efforts were stimulated further under the Five Year Plans through the Agricultural Extension Service and Community Development Projects. By 1963, almost the entire country was covered by extension agencies and their efforts were aided by programmes in other fields such as irrigation and production of fertilizers and farm implements. The latest is the introduction in 1967-68 of High Yielding Varieties Programme (HYVP) under the New Technology. These efforts, by and large, have yielded encouraging results; the use of improved seeds, fertilizers, pesticides and improved implements has spread and the willingness of farmers to accept new techniques has increased. However, the breakthrough is far from complete; substantial ground remains to be covered in several directions. But for wheat, yields in respect of other cereals and non-cereals have virtually remained stagnant for some time past. On the whole, traditional techniques still hold sway.

Traditional techniques are evolved over generations, they are continuously adjusted within a rather restricted frame to changing circumstances. As such, the farmers generally acquire a high degree of competence in the use of these techniques. The pursuit of traditional techniques involves less uncertainty. Since traditional techniques are passed on from one generation to the other, there is practically no material cost involved in acquiring them. Low cost and relatively less uncertainty of output are the two major reasons for the reluctance of the farming community to change over to the new and modern techniques.

Traditional techniques are evolved around efficient land use under meagre supply of capital. Low cost, self-reliance for supply and maintenance of production assets and intensive use of labour are the major characteristics of the traditional system of cultivation in India as elsewhere in most under-developed countries. Under these conditions, the implements used are simple in design. There are variations in design, adjusted in most cases to local conditions, to soil requirements and weather and to types of crops grown. In a vast country like India, therefore, there is a wide variety of implements. Seed and manure resources are largely locally developed and cultivation practices are adjusted to individual crops.

Crop rotation, double cropping, mixed cropping, preparation of seed-beds, and practices regarding sowing, inter-culturing and harvesting can be listed under cultivation practices. Even practices regarding watering, fruit culturing, fighting pests and diseases and general care of field and its soil can be included in this category.

**Fallowing and Crop Rotation:** Both fallowing and crop rotation practices aim at maintaining soil fertility. Continuous cropping drains away soil nutrients; fallowing is evolved to avoid this. Fallowing practices, therefore, vary depending on supply of soil nutrients and the rate of exhaustion of these nutrients by individual crops. In extreme cases of light soil, with scarce supply of soil nutrients, land is fallowed for as many as seven years after each harvest. On the other hand, in fertile soils land is allowed to rest every third, fourth or even a fifth year. As a result of the use of fertilizers and other improved methods of cultivation, area under fallows has been reduced to 20.8 million hectares in 1967-68 from 28.1 million in 1950-51.

The practice of crop rotations is evolved in order to avoid fallowing of land. However, rotation of crops is not a complete substitute for fallowing in all regions. Fallowing is included in the scheme of crop rotation once in three or five years in some cases. Where crops included in rotation supply the nutrients removed from the soil, the need for fallow may be postponed for a long time or where soil nutrients can be supplied from outside in sufficient quantity, fallowing may be completely eliminated. The most common rotations include legumes which help fixation of nitrogen in the soil and they follow such crops as cereals, cotton, etc., which remove nitrogen from the soil. As oil-seeds also help nitrogen fixation, they are rotated with grains. Heavily manured crops like sugar-cane or tobacco are rotated with cereals to take advantage of manurial value in the soil left over from the previous year.

**Double Cropping and Mixed Cropping:** Where irrigation facilities are available or where rain is heavy enough for adequate soil moisture to be retained till November, double cropping is practised. In regions of perennial water supply, even three crops are taken if resources permit. In double cropping, as in crop rotation, the farmer has an eye also on restoring soil fertility and hence the second crop is often one that fixes nitrogen. Much, however, depends on actual soil conditions. The practices regarding double cropping are, therefore, far too many for selecting typical ones.

**Multiple Cropping:** With the introduction of short-duration varieties and water management practices, the stage has now been set for a system of multiple cropping. An American variety of short duration cotton developed by the Indian Agricultural Research

Institute, for example, can be grown in rotation with wheat. One of the best Indian varieties of cotton MCU-5 can be grown only in South India. But radiation has helped produce a new mutant strain of MCU-5 which can be grown as successfully in the North as the parental variety in the South. The older varieties of cotton took 6 to 7 months to mature. The new mutant variety which will mature just in 5 months is as good as imported cotton. Similarly, new pulse varieties—*Pusa Ageti*, *Sharda* and *Mukta* all have a shorter period of maturity, the normal variety of *arhar* takes 10 months to mature while the new ones take just 5 months. The next phase of development is the scientific utilization of available resources in the form of land, water and the freely available modern inputs. As crop rotation is a healthy practice which could enrich the soil and increase the return to the farmer, some enterprising cultivators have been trying multiple cropping methods successfully. These techniques have spread widely among the cultivators in areas where irrigation is from wells or bore-wells.

New varieties of rice, oil-seeds, cotton and pulses have enabled the cultivator in crop planning through the "cafeteria approach". A great many cropping sequences have been evolved from which the farmer can choose according to the marketability of the produce, profitability of the rotation, soil and climatic conditions and his input mobilizing potential. It has been found that by introducing synergistic package comprising new varieties, new agronomic and pest control practices, better nitrogen fixation, the cultivator is able to resort to multiple cropping and at the same time harvest better yields.

There is scope for extending the multiple cropping practices in all areas where farmers have already been attuned to a higher level of agricultural technology through the HYVP. But such an extension without proper preparedness will create problems. However, before introducing the programmes on a large-scale, the Government of India has decided to launch Pilot Programmes of Multiple Cropping in 52 locations (in blocks) in different parts of the country.

These pilot projects will offer technical and financial help to the farmers in the areas covered and at the same time will serve as a sort of field research into the possibilities of growing new crops in different locations. Priorities will be given under the projects to demonstrations of multiple cropping sequences and adaptive research. This field research will ultimately help to perfect the crop patterns and the techniques for raising the crops in the different regions where the pilot programmes are located. Adaptive research and the demonstrations are deemed to be the basic support of the project and hence are fully financed by the Centre.

**Livestock Farming :** The Multiple Cropping Programme is quite comprehensive and includes livestock farming also where such ventures are likely to be profitable and suited local environments. These pilot projects are likely to offer guidelines for an integrated development of the areas where they are located, based on which the scheme could be implemented on a wide scale. Ultimately it is envisaged that the co-ordinated effort of the Governments, banks, input industries and the farmers will have the way for the multi-faceted development of the rural areas into agro-industrial complexes which could give a good return to the farmers and employment to the local population all round the year.

**Mixed Cropping :** In mixed cropping, crops are so mixed that soil nutrients removed by some are replaced by others at least partly. Since the growth period of the plants of different crops varies, the practice of a mixed crop enables taking two crops which are sown together but harvested at different times. They are so combined that the total output is larger than what it would be if only one crop was sown. Early maturing crops like *jowar* or *bajri* may be mixed with ground-nut, cotton or pulses, which mature late. When *bajri* is ready for harvest, the shoots of plants of other crops just begin to grow. The different crops grown together have varying susceptibility to variations in weather. Besides, the price-variability of these crops is also different in some cases; crops mixed together are so selected that their prices do not move parallel or the extent of their variations differs. When crops are mixed under the conditions, the farmer is able to reduce the yield and price uncertainties. The proportions of crops mixed varies from region to region and also according to the practice of mixing crops. The important crop mixtures are indicated below :

TABLE XVI  
Important Crop Mixtures

| <i>State</i>      | <i>Crop Mixtures</i>                                                                                                                                                                             |
|-------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 1. Andhra Pradesh | Cotton and sorra or ground-nut, cotton and chillies, castor and ground-nut, <i>jowar</i> and <i>moong</i> , <i>jowar</i> and <i>urad</i> , <i>jowar</i> and <i>moth</i> , <i>tur</i> and cotton. |
| 2. Assam          | Paddy and maize, paddy and cotton,                                                                                                                                                               |
| 3. Bihar          | Wheat and barley, wheat and gram, gram and barley.                                                                                                                                               |

| <i>State</i>      | <i>Crop Mixtures</i>                                                                                                                                                                                                                                                                                                |
|-------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 4. Maharashtra    | Cotton and <i>jowar</i> , <i>jowar</i> and <i>tur</i> , cotton and <i>tur</i> , <i>bajra</i> and <i>tur</i> , ground-nut and cotton, wheat and gram, ground-nut and <i>jowar</i> .                                                                                                                                  |
| 5. Kerala         | Tapioca and beans, <i>ragi</i> and legumes, tapioca and coconut, areca-nut and banana, banana and tapioca, coconut and areca-nut.                                                                                                                                                                                   |
| 6. Madhya Pradesh | Wheat and gram, wheat and linseed, linseed and gram, <i>tur</i> and cotton, <i>jowar</i> and <i>tur</i> , <i>kondon</i> and <i>tur</i> , wheat, linseed and gram, cotton and <i>jowar</i> , cotton and gram, <i>jowar</i> and <i>moong</i> , <i>jowar</i> , <i>urad</i> and <i>moong</i> , sesamum and <i>tur</i> . |
| 7. Tamil Nadu     | Cotton and chillies, ground-nut and red gram, cotton and millets, <i>cumbu</i> and black gram, <i>cholum</i> and horse-gram, ground-nut and <i>cumbu</i> .                                                                                                                                                          |
| 8. Karnataka      | <i>Ragi</i> and <i>jowar</i> , <i>jowar</i> , castor and <i>tur</i> , <i>tur</i> and sesamum, <i>tur</i> and cotton, <i>jowar</i> and <i>moong</i> .                                                                                                                                                                |
| 9. Orissa         | Horsegram and mustard, green gram and linseed, mustard and linseed, <i>ragi</i> and maize.                                                                                                                                                                                                                          |
| 10. Punjab        | Wheat and gram, barley and gram, wheat and barley, <i>jowar</i> and <i>gaur</i> , <i>chari</i> and <i>moth</i> , maize and <i>senji</i> , <i>sarson</i> and wheat, <i>toria</i> and gram, <i>ill</i> and cotton, <i>moth</i> and cotton, <i>bajra</i> and <i>moong</i> , barley and <i>masur</i> .                  |
| 11. Rajasthan     | Wheat and gram, wheat and mustard, wheat and barley, barley and gram, <i>jowar</i> and <i>moong</i> , <i>bajra</i> and <i>moth</i> .                                                                                                                                                                                |
| 12. Uttar Pradesh | Wheat and barley, wheat and gram, barley and gram, <i>jowar</i> and <i>arhar</i> , cotton and <i>arhar</i> , barley and peas.                                                                                                                                                                                       |

| <i>State</i>         | <i>Crop Mixtures</i>                                                                                       |
|----------------------|------------------------------------------------------------------------------------------------------------|
| 13. West Bengal      | Wheat and gram, wheat and linseed, paddy and <i>khesari</i> .                                              |
| 14. Delhi            | Gram and wheat, wheat and barley, barley and gram.                                                         |
| 15. Himachal Pradesh | Wheat and barley, wheat and gram, wheat and mustard, maize and seasmum, maize and pulses, barley and gram. |
| 16. Manipur          | Peas and mustard, wheat and Bengal gram or pea, rice and chillies, cotton and ground-nut.                  |

**Other Cultural Practice :** "Broadcasting" of seeds in the field is an old and orthodox method of sowing. Though it is gradually dying out, it still holds sway in predominantly tribal areas though it obtains in a few other regions also. In States like Orissa, paddy is "broadcast". It is argued that when the sowing season is brief, it is not possible to cover the entire area with line-sowing within that short period. In area where wheat is sown as a second crop and *ragi* sowing season is short, wheat also is sown "broadcast". In parts of Punjab both wheat and cotton are sown "broadcast". In these areas line-sowing is being introduced under the Five Year Plan programmes. In many parts of the country most of the crops except those transplanted are sown in line.

The technique of sowing "direct seeded rice" which is prevalent in the traditional rice areas, has now caught on in other areas as well and bids fair to be an important tool in bringing about the rice revolution. This technique helps to cut both time and cost as it does not entail any transplantation. The farmers find transplantation a costly operation and seem to be convinced that growing paddy directly from the seed is a better proposition. The "direct seeded rice" is grown in America in 100 per cent of the area under rice. In India, it is estimated, only 40 per cent would be under "direct seeded rice". In the Union Territory of Delhi the farmers had been so far used only to cultivation by transplanting the seedlings. For the first time, they are expected to switch over to "direct seeded rice".

Inter-culturing is done in line-sown crops with implements specially devised for the purpose. Enlightened farmers undertake frequent inter-culturing and weeding operations with implements. They undertake close weeding by hand and thus keep the growth of harmful

weeds to the minimum and turn the soil often enough to benefit from aeration, moisture and sunlight. The use of weedicides as substitute for intensive weeding has yet not spread, except for weeds that are persistent.

Weeds like *Kans*, once they strike root, spread rapidly, cover up the land and make cultivation impossible. Land covered by *Kans* goes waste. These weeds strike deep into the soil and ploughs with ordinary blades are of no help in removing them and reclaiming the land. These lands can be reclaimed only with the help of tractors and once reclaimed, continuous efforts are necessary to keep these weeds out. Frequent ploughing and weedicides are a good help. Land menaced by *Kans* weed is found mostly in Madhya Pradesh.

**Tillage Practices :** The primary object of tillage is to prepare a favourable seed-bed. The methods adopted for this purpose in India vary, but are usually effective. The land is worked carefully by the plough in the interval between two crops whenever there is the right quantity of moisture, which produces a layer of finely pulverized soil giving the most suitable conditions for germination. In heavy soils, the first tillage may consist of digging or deep ploughing. The cultivator's art consists largely in judging the right time to plough and in getting as much tillage done as is possible in the intervals between heavy rains or during the short period between the cessation of the rains and the sowing time.

**Improved Seeds :** Judicious selection of seeds and application of manure are both necessary for maintaining or improving land productivity. It is a common practice among farmers to select better grain for seed and preserve it till the next year. In years of scarcity due to crop failures, this process is disturbed. A large section of small farmers with poor means also finds it difficult to save grain for seed even in good years. They buy ordinary seed from the market. Improvement of seed was the first to claim attention of the State Departments of Agriculture. The progress achieved in research in this field was also comparable with that in any other country even as early as 1929 when the Royal Commission on Agriculture reported on the state of agriculture in India. However, the research was confined mainly to cash crops and particularly to cotton and sugar-cane. Wheat was the only grain for which improved strains were evolved. For wheat, the attempt was mainly to evolve a rust-resistant variety. With the introduction of the High Yielding Varieties Programme, cereals have taken precedence over cash crops. High yielding variety seeds of rice, wheat, jowar, bajra and maize are in the field since 1967-68. Recently, pulses, cotton and oilseeds have also received some attention and improved varieties of seeds have been evolved for them as well.

**Seed Multiplication :** The existing seed production and distribution arrangements were subjected to a detailed scrutiny by the Seed Review Team which reported in 1968. A number of shortcomings were brought to light. They included non-availability of quality breeders stock in adequate quantities as well as insufficiency of and lack of appropriate storage facilities on seed farms. The seed multiplication programme has not always yielded stock of the requisite purity. There have also been shortcomings in regard to the processing of seeds and the distribution arrangements.

The breeder seed is now sought to be produced in adequate quantities with the help of Indian Council of Agricultural Research and the National Seeds Corporation (NSC). The Corporation receives breeder seed from Research Institutions after the variety has been notified for release by the Central Varieties Release Committee. The production of foundation seed from the limited stock of breeder seed is taken up by NSC in the immediate next season to meet the immediate requirements. The Agriculture Universities are also involved in the process of the production of foundation seed.

For the production of certified seed, a number of agencies are involved including the State Seed Farms, Central Seed Farms, private seed producers and seed producers' co-operatives. It, however, takes one year before the foundation seed is made available to the various agencies which produce certified seed. The finally multiplied seed is thus made available to the farmers only in the second or third year. Although research in seed development started in 1929, no significant efforts had been made in the direction of a quality seed industry until 1963-64 when NSC was set up. In addition to the seed farms established by the State Governments, the Central Government has also set up large sized farms where the focus of activities has shifted to the production of seeds. Finally a beginning has been made in the organization of seed producers co-operatives through a scheme sponsored by the National Co-operative Development Corporation. The Tarai Development Corporation was established during 1970 with the assistance from the World Bank. In *kharif* 1970, paddy, maize, sorghum, and soyabean seeds were grown over an area of 4,000 hectares and in *rabi* 1970-71, 5,265 hectares were brought under wheat seed production. The total quantity of foundation seed produced by the National Seeds Corporation has increased from 4.37 tonnes in 1963-64 to 499.90 tonnes in 1970-71. Certified seed production increased from 2.44 tonnes in 1964-65 to 1574.16 tonnes in 1970-71.

**Seed Distribution :** Seed certification with its essential elements of field inspection of crops for varietal purity, proper isolation distance and supervision at harvesting has been generally lacking

for quite some time. Even though the Seeds Act was passed in 1966, certain sections of the Act could be brought into operation only in October 1969. A Central Seeds Committee has now been set up under the Act and a review of implementation of the Seeds Act in the various States was made at the Zonal Conferences during 1970-71. The State Governments are organizing training programmes for officials, extension agencies, traders, seed producers and farmers to bring home to them the salient features of the Seeds Act.

Recently an All-India Seed Certification Seminar was organized by the Agriculture Ministry to consider the establishment of a sound certification system in the country. The Seminar recommended that in each State there should be established a State Seed Certification Board independent of the agency producing and distributing seeds and of the enforcement of the Seeds Act. It also recommended that there should be a Central Seed Certification Board for co-ordinating the functioning of the State Boards and for laying down norms and standards for guidance. The recommendations of the Seminar have been accepted by the Government.

**Area Under Improved Seeds :** The object before the Fourth Plan was to cover nearly 72 million hectares under improved seeds—about 25 million hectares under high yielding varieties, 15 million hectares under multiple cropping and about 8 million hectares in assured rainfall areas and 24 million hectares in dry cultivated areas. High yielding varieties of wheat, rice, *jowar* and *bajra* were introduced during 1967-68 while those of maize have been made in the field for many years. Although a good deal of progress has been made under the programme, it has not, however, been uniform with regard to each of the crops. While nearly one-third of the area under wheat has been covered by the high yielding varieties, the corresponding figures for rice, *jowar*, *bajra* and maize are only 14.7, 5.4, 13.7 and 8.7 per cent respectively. The total area covered under wheat and rice during 1970-71 was more or less the same. The progress made in respect of wheat is remarkable in the sense that West Bengal, Orissa and Punjab have covered 88.4, 71.4 and 68.1 per cent of their wheat area under high yielding varieties. Haryana and Tamil Nadu have also half of the area covered. In the case of rice, on the other hand, but for Tamil Nadu and Jammu and Kashmir, the progress made is rather slow (Table XVII).

Among the non-food crops, cotton probably is the only crop, so far, for which improved seed is extensively used. The Indian Central Cotton Committee has been doing useful work in this direction. In regard to oil-seeds, progress on the whole is small, though regions like Andhra Pradesh, Tamil Nadu, Kerala and Punjab have shown

TABLE XVII  
Area Under High Yielding Varieties—Cereals

| State            | Crop  | 1969-70                    |                                                          |                                  | 1970-71                    |                                                          |                                  |

\* Figures for Assam include those for Meghalaya.

considerable interest in spreading the improved varieties of oil-seeds. In the case of tobacco, there has been a shift from inferior to superior types like Virginia tobacco.

**Manures and Fertilizers :** Plants, like other forms of life, depend for their growth upon adequate supply of the necessary growth factors and the ultimate growth is conditioned by that factor which is scarce. In its tropical location, India enjoys a relatively long period of plant growth which helps the farmer to produce green manure or compost required for each field ahead of the main crop. In most other countries, this is possible only at the expense of a major crop during a complete growing season. Besides, potash—an expensive plant nutrient—is found in abundance in Indian soils. The main deficiency is in soil nitrogen resulting from intense biological activity in the soils under tropical conditions. At higher levels of production, particularly in the case of a crop like wheat, the emphasis now is on a balanced use of fertilizers which also includes micro-nutrients like zinc and copper. The Fourth Plan target for fertilizers has accordingly been put at 3.2 million tonnes of nitrogen, 1.4 million tonnes of  $P_2O_5$  and 0.9 million tonnes of  $K_2O$ . The consumption levels during 1970-71 as against this were 14.26 lakh tonnes of N, 4.61 lakh tonnes of  $P_2O_5$  and 2.26 lakh tonnes of  $K_2O$  (Table XVIII).

The organic manures like farm yard manure, compost manure and green manures are locally available. Farm yard manure consists of cattle dung and other waste materials including foliage found in fields. In terms of soil nutrients, the average composition of farm yard manure obtained in India is of the order of 0.3 per cent of N, 0.15 per cent of  $P_2O_5$  and 0.3 per cent of  $K_2O$  as compared to about 1.3, 0.3 and 1.0 per cent respectively of these nutrients in other countries. The low soil nutrient content is largely due to inefficient methods of preparation of farm yard manure. In most cases, the farm yard waste and dung are collected in uncovered heaps or dumped in ditches. Animal urine is rarely utilized for the purpose. Livestock and human excreta along with their urine, if fully utilized is a potential source of over 16.0 million tonnes of nitrogen, 6.1 million tonnes of  $P_2O_5$  and 16.7 million tonnes of  $K_2O$ .

Composting of farm yard manure is recommended to improve nitrogen content and to increase the total organic material in the soil. Town compost comprises of such organic materials as night soil, slaughter-house refuse, etc. These are useful for maintaining the texture of the soil under Indian conditions. Whereas rural compost is produced and consumed locally, urban compost has to be transported to consumption centres and the transport costs and other difficulties limit its utilization.

TABLE XVIII  
Consumption of Nitrogen in India During  
1965-66 to 1970-71

('000 tonnes)

| State             | 1965-66 | 1966-67     | 1967-68       | 1968-69       | 1969-70       | 1970-71      |

3. (a) : Below 500 tonnes

Use of organic manures in conjunction with chemical fertilizers is essential for preserving the nutritional balance and fertility of the soil. Production and utilization of organic manures, therefore, constitute an important activity under the agricultural production programme. During 1970-71, the anticipated production of rural compost was estimated at about 155 million tonnes compared to about 145 million tonnes in 1969-70. Stress is laid on utilization of farm and cattle wastes, green leaves and shrubs and trees, water hyacinth and tank silt for composting or direct use under the urban compost scheme. About 4.3 million tonnes of compost was to be made available for distribution during the year 1970-71 under the scheme. The project for the setting up of pilot compost plants for manufacturing organic manure from city wastes as envisaged under the Fourth Five Year Plan is also expected to be initiated. Schemes for sewage/sullage utilization, which provide irrigation water as well as plant nutrients and organic matter are in progress.

Green manure is widely used in irrigated crops, particularly rice and wheat. For green manuring, crops like horsegram (*Dolichos bifloris*) and Bombay hemp (*Crotalaria juncea*) are grown before the main crop is sown and they are subsequently buried in the soil. The coverage under green manuring increased from 8.5 million hectares during 1969-70 to an anticipated level of 10.4 million hectares in 1970-71. The progress of green manuring has been encouraging in States like Uttar Pradesh, Andhra, Tamil Nadu and Orissa. The green manuring programme under the Fourth Five Year Plan has been included in the intensive rotations which are being developed.

Besides the above organic manures which are sometimes referred to as bulk organic manures, there are concentrated organic manures in use like oil cakes, bonemeal, dried blood, horns and hoofs, etc.

The most important nitrogenous chemical fertilizers are ammonium sulphate, ammonium nitrate, ammonium calcium nitrate and urea. The important phosphatic fertilizers are superphosphate, rock phosphate, and ammonium phosphate. In the past 50 years, several types of nitrogenous and phosphatic fertilizers were introduced in India and tried at different experimental stations. But a systematic effort to manufacture and popularize them was under the Five Year Plans.

Manufacture of nitrogenous fertilizers in India was taken up on a big scale with the Sindri Fertilizer Factory going into production in 1951. Since then there has been a big spurt in the production and consumption of fertilizers (Table XIX). According to the annual review of production and consumption of fertilizers in 1970-71, the output of nitrogenous fertilizers was 879.8 thousand tonnes. Consumption during the period was about 1,425 thousand tonnes, the production

Note : (i) The all-India figures have been arrived at by converting fertilizer materials into nutrients.

(ii) From 1963-64 onwards brackets figures are on April-March and others on July-June basis.

1. Excludes data in respect of bonemeal and rock-phosphate.

2. Figures from 1952-53 to 1957-58 are on April-March basis.

3. Figures from 1952-53 to 1956-57 relate to calendar years ending in the first half of the period stated while from 1957-58 to 1962-63 they are on April-March basis.

4. Figures from 1952-53 to 1957-58 refer to calendar years ending in first half of the period stated while from 1958-59 to 1962-63 they are on April-March basis.

5. In the case of potash from 1952-53 to 1958-59, in absence of distribution figures the quantity imported is taken as distributed. Figures relate to financial year April-March.

\* Allotments of fertilizers under the "Central Fertilizer Pool".

\*\* Figures incomplete for lack of details of despatches relating to production of 15,663 tonnes of N and 8,546 tonnes of  $P_2O_5$ .

during 1971-72 was estimated at 1,042 thousand tonnes against projected offtake of 1,625 thousand tonnes.

The phosphatic fertilizers produced and consumed in India are mostly in the form of superphosphate. Until 1956, these fertilizers did not become popular. But it was realized that continuous use of nitrogenous fertilizers alone would deplete the phosphorus content of the soil unless the latter was adequately replaced. Hence, the Government propagated the use of balanced fertilizers containing all plant nutrients in the form of manure mixtures. Production of phosphatic fertilizers rose from 223.3 thousand tonnes in 1969-70 to 248.8 thousand tonnes in 1970-71. The growth in the output of phosphatic fertilizers is largely due to the improvement in the availability of the basic raw material—rock phosphate from mines in Rajasthan and Andhra Pradesh.

The consumption of potassic fertilizers is mostly in the form of muriate of potash and sulphate potash which are mainly imported, local production being negligible. The consumption of potassic fertilizers grew from 209.8 thousand tonnes in 1969-70 to 226.2 thousand tonnes in 1970-71.

There have been region-wise disparities in the production and consumption of fertilizers. The Southern and Northern regions accounted for more than a third of the country's consumption of all nutrients, with the South being marginally ahead due to the comparatively higher share in the offtake of potassic and phosphatic fertilizers.

The present installed capacity is of the order of 1,344 thousand tonnes of nitrogen and 421 thousand tonnes of phosphatic fertilizers (in terms of nutrients). Additional projects under implementation would have a capacity of 1,848 and 778 thousand tonnes respectively for the two categories of fertilizers. India has in a way to invest Rs. 225 crores a year to meet its growing demand for fertilizer. The problems faced by developing countries like India in the field of fertilizer industry include external and internal finance, foreign exchange needed for import of spare parts, lack of properly trained personnel and marketing and credit facilities. At the top of that, farmers have also to be educated on the need to use fertilizers.

**Promotion Effort :** A number of measures have been taken by Government to promote the optimum consumption of fertilizers. Fertilizer manufacturers and State Governments have been asked to hold demonstrations of the characteristics of various types of facilities and organize training of extension personnel, fertilizer dealers and salesmen. A syllabus has also been drawn up for training

fertilizer dealers. The State Governments have been asked to strengthen and utilize fully their soil testing facilities so that soil test results are made available to the farmers within 10 to 15 days after the receipt of the soil sample.

Under the Programme of National Demonstrations and in the context of Farmers' Training and Education (with special emphasis on practical scientific demonstrations on farmers' fields) close attention is being given to the application of prescribed dosages of fertilizers in a balanced way. Information and publicity media are being used for promoting larger fertilizer consumption. The Government have also under consideration proposals for setting up a Fertilizer Promotion Council as a joint venture of the Government of India, State Governments, the industry and agro-industries for promoting optimum and balanced use of fertilizers.

The Central Fertilizer Control Laboratory is being established which will act as a reference laboratory and will train the inspecting staff of the State Governments in drawing and analyzing fertilizer samples.

**Crop Diseases, Insects and Pests :** The loss entailed as a result of damage caused by diseases, pests and insects to crops at various stages of growth from sowing to harvesting, storage and in transportation is estimated to be 20 per cent of total crop output. The prevention of this damage is therefore important.

Nearly 40 diseases and over 85 species of insects are known to attack the rice crop in the field and in storage. The most widely prevalent and destructive diseases are blast, helminthos, poriose, stem rot, foot rot and physiological root rot. Among the insects and pests, stem borers, swarming caterpillars, mispa, grass hoppers, gundhi bugs and gall fly are most prevalent and most destructive in the field. During storage nearly 12 different insects damage the grain.

In the new agricultural technology, plant protection has acquired an added significance. This is due both to technical and financial reasons. In the case of high yielding varieties, conditions which are conducive to the growth of the plant population are also favourable for weeds, pests, and diseases. Moreover, the high yielding varieties necessarily entail a high cost of cultivation and hence a cultivator can ill-afford to lose his crop. If full benefit is to be derived from the costly inputs, plant protection measures in various forms, such as seed treatment, weed control and post-sowing prophylactic treatment, must be made an integral part of agriculture practices.

Millions of tonnes of wheat were destroyed by a big rust epidemic in 1947 and 1954. In 1950-51 and 1957-58 the potato disease appeared over a wide area in the plains of Bihar, Uttar Pradesh and Punjab and caused a loss of over 50 per cent of the crop. There was

a sudden eruption of pests and diseases on an area of 1.0 million hectares during 1969-70. The area affected during 1970-71 was nearly 4 lakh hectares spread over the States of Andhra Pradesh, Bihar, Jammu and Kashmir, Madhya Pradesh, Maharashtra, Karnataka and Rajasthan.

Four types of methods are adopted for preventing damage to crops by insects and pests. They are classified as : (1) Quarantine, (2) Biological Control, (3) Cultural Methods, and (4) Chemical Treatment.

In the past, owing to lack of efficient quarantine arrangements, injurious insects and pests entered the country and spread widely. Quarantine and fumigation stations have now been set up at Madras, Calcutta and Bombay. Besides, based on the knowledge of the existing pests and diseases in the country, plant quarantine measures are being taken to prevent the entry of diseases and pests through inter-State movement of plant materials.

Biological control of insects and pests, in which the natural parasites and predators of the pests are exploited to destroy the pests, has met with considerable success. A well-known example of such control is the use of the cochineal insect for the eradication of the prickly pear. Considerable work has been done in the country after independence on the science and practice of biological control ; pest control methods have been in operation against sugar-cane borers and nupenthes of coconut in the South. Biological control research is conducted at the Indian Agricultural Research Institute.

In the case of some pests and diseases, physiological and agronomical methods are used to control their incidence. Adjustment of planting dates, mixed cropping or crop rotation, judicious manuring or supplying balanced fertilizers, controlled irrigation, etc. constitute economical and fruitful methods of protection against the disease or pest incidence. A change in the time of sowing wheat was a major factor in Hessian fly control and a similar method has dealt effectively with the Tirak disease in cotton. The limitation of the method is that a variation of cultural practice which prevents the onset of the disease or pest has also an adverse effect on crop yields and the cultivator prefers the former risk at times.

Another very successful line of the attack is the cultivation of varieties resistant to pests and diseases. Seed treatment is the first critical stage of plant protection according to the Fourth Five Year Plan. Dressing the seed with chemicals before sowing protects it from seed and soil borne diseases and is essential for increase of plant population which is responsible for the yield potential of the new varieties. Seed treatment is proposed to be given to 26 million hectares during the Fourth Five Year Plan.

The use of insecticides and fungicides is adopted extensively in the country for eradication of pests and diseases. Powerful insecticides like chlorinated hydrocarbon compounds and organo-phosphorous compounds are revolutionizing the methods of control of insects and pests. Some of the organo-phosphorous compounds are systematic in their action as they are absorbed by plants and are translocated to different parts of the plant. Likewise, systematic fungicides are also being developed. Many antibiotics have been used successfully for the control of bacterial plant diseases.

Laboratory experiments have proved conclusively that by spraying a mixture of a paraffin-based oil and insecticide, the white fly can be killed almost instantaneously. At the U.P. Agriculture University's Experiment Station, a plot of pulse crop sprayed with the mixture has remained unaffected though it is surrounded by crop affected by yellow mosaic.

Post-sowing intensive prophylactic treatment constitutes the main plank of the plant protection programme. In the Fourth Plan, a target of 34 million hectares is envisaged for this purpose. In order to be effective, this programme will require two main supporting measures. The first relates to organization of a surveillance and warning system. The second is intensive research on determination of the most effective chemical control measures for various pests and diseases. It is intended to give attention to both these aspects in the Plan.

Weed control is another important aspect of plant protection. Such control through manual labour has obvious limitations in high density crops. Hence there is need for increased stress on chemical weed control measures. Since 1964, co-ordinated control trials on paddy have been conducted with satisfactory results. The Plan envisages a target of 2 million hectares for weed control.

Besides seed treatment, weed control and prophylactic spraying, other measures envisaged relate to rat control and control of epidemics. For anti-rat operations, a target of 10 million hectares is envisaged. For all the plant protection programmes taken together, it was contemplated that about 80 million (gross) hectares will be covered by the end of the Plan.

Effective adoption of plant protection measures by cultivators is often inhibited by two among other factors, namely, lack of technical skill in the use of pesticides and ineffectiveness of individual operations. In this context, the Plan envisages strengthening of the official plant protection services and expansion of training facilities. Steps will also be taken to strengthen the agro-aviation arrangements both in the public and the private sector. In the endemic areas, repeated aerial spraying is envisaged for eradication of pests and

diseases. Such spraying is proposed to be financed by the Centre while the cost of the material used will be borne by the States.

Unlike chemical fertilizers, plant protection material is still largely distributed by official agencies. It is estimated that, at present, about 50 per cent is handled by Government personnel. Co-operatives and panchayats, account for about 25 per cent and the balance is retailed by private dealers and manufacturers. It is estimated that by 1973-74 the annual consumption of pesticides should go upto 66,000 metric tonnes of technical grade material as against the present annual consumption of 40,000 metric tonnes. If this is to be accomplished, vigorous action by the industry, Government and the co-operative organizations will be necessary. Plant protection measures benefited a gross area of 48 million hectares during 1969-70. The target for 1970-71 was fixed at 52 million hectares.

The locust menace causes considerable damage. During the present century, there have been five locust cycles during which Rajasthan, Punjab, Saurashtra, Kutch, Gujarat, and parts of Maharashtra State, were affected. The permanent homes of locusts lie in extensive belts in Africa and countries of West Asia. Locusts attack not only agricultural crops but also forests and all types of green vegetation. The Government of India have maintained a Central Locust Organization to fight this menace and adopted measures which include spraying and dusting of chemicals on a large scale in the breeding areas in India. The attacks on crops in the cultivated area met by mechanical and chemical methods such as the destruction of eggs by exposure after ploughing, burying them in trenches, etc. To intensify the campaign, aeroplanes, helicopters and other equipment are being obtained under the Technical Assistance Programme.

**Implements :** Indian tillage implements are few, simple in design and indigenous in pattern and locally manufactured. The design of each implement varies in detail from region to region to suit local needs and conditions. Not all implements are used in all regions. The use of some is restricted to a few. Since the commencement of the Third Plan, a number of steps have been taken to develop improved agricultural implements. While some success was achieved, parts of the programme continue to suffer from a variety of shortcomings, such as lack of suitable designs, high cost of manufacture and lack of adequate facilities for sale and repair. These problems will receive attention through intensification of research in agricultural engineering, and improvement of arrangements for fabrication and distribution of implements. Considering that there are nearly 70 million draught bullocks, the scope for improved animal drawn equipment is enormous and their contribution to productivity can be significant. It is estimated that animal drawn seed drills and planters can save

upto 40 per cent of the time compared with broadcast sowing. Hence stress will continue to be laid on the programme for animal drawn implements and hand tools.

The most common implements are : (i) ploughs, (ii) harrows, (iii) clod-crushers, (iv) seed-drills, (v) hoes, (vi) rollers, (vii) levelers, (viii) riders, and (ix) harvesting implements.

Plough is the primary implement used all over India. *Desi* ploughs have almost a common design and they differ mostly in size, depending on the type of soil and the size of the bullocks used in particular areas. The heaviest ploughs are found in the black cotton soil areas of India. The *desi* plough is almost like a western style cultivator.

All indigenous ploughs are similar in design, but vary considerably in size and weight to suit the prevailing soil types, ploughing conditions and the weight and height of draught animals in the locality. Heavy indigenous ploughs are being gradually replaced by mould board ploughs which have greater operational efficiency. The blade of the indigenous plough is designed to plough upto 15 cm. deep. It stirs but does not turn the soil. The working draught varies from 27 to 159 kg.

The harrow is mainly used as a secondary tillage implement. It supplements the work of a plough for preparing the seed-bed for crops and for covering the seeds after sowing. In lighter soil, harrows are used for ploughing also. The useful life of a harrow ranges from 2 to 6 years. The clod-crushers are used immediately after ploughing and harrowing. Heavy wooden logs or planks are used for crushing the clods. The practice of drilling seeds is fairly wide-spread throughout India except in Assam and some parts of West Bengal, Bihar, Kerala, and the Konkan coast. Transplants paddy is a major exception ; drilling is not possible in its case. The simplest seed-drill consists of a vertical tube with a seed-bowl and is fitted with a shoe-piece and a wearing point at the lower end. The simple type of seed-funnel is used mostly in tribal areas. There has been a steady growth in the demand for seed-cum-fertilizer drills and seed-planters which are not yet readily available in the country. Efforts are being made to produce them in the country.

The hoe is an all-purpose farm implement used for many cultural operations—preparing small seed-beds, for forming ridges, for bunds, and water courses and channels. It is also used for removing stalks of harvested plants, for harvesting root crops such as potato and ground-nut and for thinning of “broadcast” as well as drilled crops. All the indigenous manually and bullock drawn hoes are generally manufactured by the village artisans and the material for its construction is supplied locally. The cost and durability of a hoe are similar to that of a harrow.

The use of rollers is wide-spread particularly in areas where dry farming is practised in order to make the seed-bed compact and thereby facilitate the germination of seeds.

The most common type of harvesting implement is the hand sickle with a plain blade. Scythe, an improvement over sickle, is not in common use.

**Improved Implements :** Marginal changes in the design of different implements have been introduced at various stages of development. Attachments to seed-drill help spreading manure along with seeds, attaching wings to harrow to perform close weeding and iron mots (water lift) instead of leather mots are some of the improvements introduced by local craftsman to meet the changing demand. The Departments of Agriculture in States also carry out engineering research and they have produced iron-plough, Olpad hoe, Baroda hoe, chaff-cutter, winnowing fan, plant-pullers, improved sugar-cane crusher, improved furnace for boiling sugar-cane, dust guns to spray pesticides, etc. Some of the improvements have been adopted from designs obtained from advanced countries and adopted to local needs. As a result of research, some implements like the simple axe and the spade have undergone changes in design. The use of shovel in place of the spade makes lever action less arduous. Carts have now pneumatic tyres to reduce the strain on animals. Not all these improved implements are used all over the country : chaff-cutters are widely used in Punjab, and iron-ploughs in Saurashtra and Maharashtra. There are other improved implements which are mostly of imported design such as tractors, oil-engines, electrical motors, power driven sugar-cane crushers, etc.

As for the power driven machinery, use of tractors and other agricultural machinery and equipment is gaining popularity. The number of tractors in use has doubled in the last 5 years rising to the level of 108 thousand units in 1969-70. In the same period the number of indigenously manufactured tractors has nearly doubled to the level of 17.1 thousand. The demand for power-tillers and combined harvestors is also rising.

Successive bumper crops of wheat during the past few years and inclement weather immediately after harvesting of wheat has necessitated the introduction of combined harvestors and threshers. To avoid harvesting losses, it has been decided to import labour saving harvesting machines; arrangements have been made for the import of 75 combined harvestors. The programme for 1970-71 was to import about 300 combines both on cash and barter basis. Power-threshers, which were concentrated mainly in Punjab have become quite popular in the neighbouring States of Haryana, Uttar Pradesh and Rajasthan. Power paddy-threshers were introduced

only very recently and are gaining popularity in the eastern and southern States. Power maize-shellors are in common use in Punjab and are also getting popular in Maharashtra and Andhra Pradesh.

There are at present 5 units which produce tractors in the country in the range of 20-25 h.p. With a total capacity of 30,000 units per annum, actual production has been well below 20,000. Further capacity of 31,000 units has been sanctioned and the Agriculture Ministry is of the view that this will fully meet the internal demand for tractors.

Agro-industries Corporations have been set up in all the States except Nagaland and Meghalaya. In the initial stages, all these Corporations concentrated mainly on the distribution of tractors, power-tillers and pump-sets and other items of agricultural machinery on cash and hire-purchase basis. Presently all imported tractors are being distributed through these Corporations with a view to eliminating black-marketing and ensuring their supply to farmers at fair and reasonable prices. The Corporations have also been directed to set up agricultural machinery hiring centres with a net-work of sub-centres and workshops for providing hiring facilities to medium and small farmers. The Corporations in Assam, Andhra Pradesh, Bihar, Haryana, Kerala, Karnataka, Uttar Pradesh, Madhya Pradesh, Orissa, Tamil Nadu, Punjab, Rajasthan and West Bengal have set up 71 hiring centres and workshops. Some Corporations have also introduced mobile workshops for providing after-sales facilities in the interior where regular workshops do not exist.

### IX. Finance

**Agricultural Credit Situation :** The salient features of the present day agricultural credit situation in the country are stated here briefly :

1. The majority of Indian farmers are small holders and belong to the low income group. According to creditworthiness, the agriculturists may be classified into three categories : (a) Creditworthy—those who satisfy all sound banking rules to obtain adequate and necessary credit ; (b) Potentially Creditworthy—those whose income can be sufficiently raised to make them fully creditworthy by providing proper credit and technical assistance; and (c) Non-Creditworthy—those who lack sufficient land and do not have any alternative source of income and whom credit alone cannot help in improving their income to the extent that they may be able to make their both ends meet. Most of the farmers fall in

the second category. For certain kinds of loans, e.g. loans for land reclamation, irrigation, permanent improvements, and purchase of heavy and costly equipments, a large number of farmers in the first category may also have to be down-graded to the second one.

2. The inadequate growth of institutional credit agency and extreme dependence of the farmer on the private money-lender have led to very unpleasant consequences. Indian agriculture is suffering badly from want of capital. It is the mainstay of about 70 per cent of the total population, yet it is the most capital starved industry in the country. This has been responsible for the static or even retrogressive condition of Indian agriculture today. The lack of capital in agriculture is not a new malady; it is very old and chronic. The credit requirements in farming are so large that private individual resources can never fully meet them. If, in the past, the drawbacks resulting from the lack of adequate capital were not so obvious, it is because agriculture then followed a subsistence and extensive cultivation pattern and money had not assumed the importance as it has now. Today, for achieving the objectives of intensive cultivation, high yields, increased income, adoption of technical and technological improvements, the use of more and more capital in farming is an absolute necessity.
3. The cumulative effect of agricultural debt legislation during the last quarter of the century and of the more recent land reform measures has been further to contract agricultural credit facilities.

**Need for an Institutional Credit Agency :** For progressive agriculture, adequate agricultural credit facility is essential. It is axiomatic that the credit requirements in agriculture cannot be met by private individual resources alone even when the money-lender is not fettered by any legal restrictions in his credit operations. Moreover, profit being the sole guiding consideration of the private agency, credit from the money-lender cannot be canalized to uses which are socially most desirable nor it can be made available to farmers who are not creditworthy under strict banking rules. The returns from capital investment on certain types of agricultural improvements are so low that these improvements can only be taken up if credit is made available at exceptionally low rates of interest and for a long term. As the agriculturist needs credit at specially favourable terms, an effective control over its use becomes a social obligation. That is why public and expert opinion now favours an institutional agency for agricultural credit. Institutional credit system has actually been

developed with liberal State assistance in most countries of the world during the present century.

Another strong point in support of the institutional system is that agricultural credit is no more interpreted in the narrow sense of merely granting of loans. It has a much broader connotation now and combines in itself both technical guidance and planning of the farm business. The farmer is not only to be helped with a loan but he has also to be given the necessary guidance to make the most effective use of it so that he may maximize his earnings from land. It is increasingly felt that, if the farmer who is taught the improved methods of farming, is not provided with the means for carrying them out, no useful purpose will be served by merely expanding the agricultural extension services. Therefore, the credit services and the agricultural extension services in other countries work in close collaboration. There can be no doubt that to dispense with this type of credit among the farmers and also for its recovery, there cannot be a more suitable organization than that of village co-operatives. The idea of co-operation, particularly in agriculture is inherently sound. If life has been lacking in agricultural co-operatives so far, it is mainly due to poor management for which lack of proper internal leadership is chiefly responsible. This and the absence of a well defined co-operative loan policy together explain the paradox of funds lying idle with co-operatives and agriculture suffering for want of finance.

However, for improving management through either the development of internal leadership or official assistance, the situation is now favourable. Under various schemes such as Community Projects, National Extension Blocks and reorientation of education with greater agricultural bias as in Uttar Pradesh, the services of a very large number of trained village and group level workers have become available for proper guidance and even actual management of the village co-operatives.

**Credit Agencies :** Besides the private money-lenders and professional agriculturists etc., the main source of credit till recently has been the Government and co-operatives. These institutions played only a small role for quite some time. Co-operatives provided only 3 per cent of the borrowings in the year 1950-51. This went up to 15.5 per cent during the year 1961-62 and there has been a remarkable improvement during the last decade. As a result, co-operatives today account for as much as 30 per cent of the total credit requirements of the cultivators.

During 1969-70, short and medium-term credit advanced by these co-operatives was estimated to be of the order of Rs. 526.74 crores and it was expected to go upto Rs. 615.04 crores by 1970-71. In the

sphere of long-term developmental finance for agriculture, land development banks constitute the main source for credit. These banks which provide credit to farmers for land development, minor irrigation and purchase of expensive farm machinery, have also made sufficient progress. While the quantum of fresh long-term loans issued by the Co-operative Land Development Mortgage Banks was Rs. 58 crores in 1965-66, it was estimated to be Rs. 155 crores in 1969-70 and is expected to be still higher during 1970-71. The public sector institutions viz, the Reserve Bank of India, Life Insurance Corporation and the State Bank of India provide support to the debenture floatation programme of Co-operative Land Development Mortgage Banks. The Government of India have also been purchasing the debentures during the Fourth Plan period to fill the gap in the availability of long-term resources for investment in agriculture. An amount of Rs. 17 crores was utilized during the year 1970-71.

*Taccavi* loans are being provided by some of the State Governments. Procedures for distribution and recovery of *taccavi* loans, by and large, approximate to the co-operative loans. The Government of India also provide short-term credit to the State Governments for giving *taccavi* loans. During the year 1970-71, a budget provision of Rs. 60 crores was made for this purpose, which was utilized in full.

Institutional finance for agricultural development is also being supplied by the 17 Agro-Industries Corporations set up in various States. Many of these Corporations provide additional line of credit to cultivators for the purchase of tractors and agricultural machinery under hire-purchase schemes.

The Agricultural Refinance Corporation was given statutory shape on May 1, 1963 with an issued share capital of Rs. 5 crores. Like other financial agencies, it does not involve itself in direct financing to the agriculturists but operates through the established long-term financial institutions in the co-operative sector. The Corporation's special schemes are intended to be implemented within compact areas with close supervision, economy in administration, co-ordination among technical and non-technical agencies and necessary State assistance. In recent years, it has been playing an extending role in supporting agricultural development specially minor irrigation.

The gigantic financial cost of ensuring complete modernization of India's agriculture will have very little chance of being realized unless there is some dramatic change in banking traditions and the rural credit system. The total short-term credit needs by the end of 1973-74 were estimated at around Rs. 2,000 crores, which no single institution could possibly finance. Since co-operatives alone could

not meet this challenge, it was thought necessary to bring in commercial banks which had so far played only a minor role in agricultural finance.

**Commercial Banks :** With the green revolution in agriculture in 1967-68, there arose the need for an increasing quantum of credit for procurement and distribution of various inputs. The present set up of co-operative credit structure, with the primary agricultural society as its base, is unable to absorb all the credit provided to it. There were problems of overdues. The requirements of the agricultural sector are so large and diverse that both the commercial banks and co-operative banks can play a mutual complementary role.

In areas where central co-operative banks are weak, the commercial banks have now been brought into the picture for financing good working primary agricultural credit societies, which were starving for want of finance from major financing institutions. This scheme has been introduced in the States of Andhra Pradesh, Haryana, Madhya Pradesh, Karnataka and in selected districts of Uttar Pradesh.

Commercial banks have also started playing a larger role in the financing of agricultural development. The level of direct financing by commercial banks for agriculture rose from about Rs. 44 crores on June 30, 1969, to Rs. 184 crores on June 30, 1970, and further to Rs. 217 crores on September 30, 1970. The total number of accounts under direct finance were 8.18 lakhs on June 30, 1970, which went upto 9.54 lakhs by September 30, 1970.

The Agricultural Finance Corporation set up by the major commercial banks, before nationalization, has also been playing a significant role in the field of agricultural credit. The total outlay on schemes approved by the Agricultural Finance Corporation has risen to the level of Rs. 108.22 crores for 25 schemes as on July 10, 1970. This Corporation guides major commercial banks for taking up special projects for agricultural development and also acts as a co-ordinating agency. The National Level Consultative Committee formed in June 1969 is helping the commercial banks and financing agencies in this regard. Among the schemes for which loans have been sanctioned by this Corporation, special mention may be made of seven loans amounting to Rs. 39.39 crores to the State Electricity Boards for energization of irrigation wells.

The Reserve Bank has decided to appoint major banks as "Lead" banks for various districts in the country. Such banks are expected to assume an important role in the development of banking and credit in the allocated districts. Their role will be to act as consortium leaders. After identifying the areas requiring branch expansion and the areas suffering from credit gaps, it should invoke the

co-operation of other banks in the districts for opening new branches as well as meeting credit needs.

## X. Marketing

Marketing of agricultural produce is a complex activity. It embodies the various functions, such as, assembling, grading, standardizing, packing, storing, processing, financing, transport and communications. Market news and information have also an important role to play.

**Market Functionaries :** The human agency in the marketing process is an important consideration. The functionaries of the various marketing activities at market places adopt their own techniques of operation, procedure of business and trading practices. Techniques of marketing and organization vary in accordance with the economic conditions, nature of the marketable product, the area and location of marketing, marketing agencies and the rate of technical and commercial development.

There are several types of functionaries in the *mandi* such as *arhatiyas* or commission agents, *dalals* or commodity brokers, general agents, and agents for specific commodities and purposes. The agencies in the chain of marketing from the producer to the manufacturer and the consumer depend upon the nature of the crop also.

**Types of Markets :** Markets for agricultural commodities can be broadly classified into three groups : (i) *hats* and *shandis* ; (ii) wholesale markets or *mandis* ; and (iii) retail markets. *Hats* and *shandis* are markets periodically held, the former usually once or twice a week and the latter either at long intervals or on special occasions. Agricultural produce or livestock or both are sold in these primary markets, which number about 22,000 and are located mostly in the interior of the country. The areas served by a *hat* vary considerably. In some cases they are only villages while in others they may extend over a radius of 100 to 115 kilometres. They can also be termed as primary markets.

*Mandis* or wholesale markets form the most important part of agricultural market structure. There are about 1,700 wholesale markets in the country. Most of them command quite a large area and the produce is brought for sale from the primary markets, by the producers direct or by the middlemen such as village merchants, itinerant dealers, and agents of traders in the *mandis*.

Most *mandis*, particularly those in the producing areas, function as both primary and secondary markets. Primary markets are those where bulk of the produce is brought by the producer himself for sale,

The primary markets serve as feeding centres for the secondary markets which are usually wholesale markets and serve as second point of assembling, the first being the primary markets. Markets from where the produce is exported outside are known as terminal markets. A terminal market could also be a primary and secondary market.

The bulk of marketed surplus of the farmers is usually sold in the village. The All-India Rural Credit Survey shows that about 65 per cent of the total sales of crops are effected in the village. There are many reasons for the bulk of the produce being sold by the farmer in the village. The farming units are small; many farmers do not possess means of transport. Road development is not quite adequate, farmers are illiterate and the market information service is yet to have ramifications in the villages. The system of agricultural credit is also defective. The farmer has to depend on the village merchant for loans and there is quite often an undertaking that the farmer will sell his produce to the merchant.

In many areas, keen competition among the buyers makes the village price quite fair and attractive as compared to the prices in *mandis*. It is only in backward areas that the margin of difference is large and the prices offered to the farmer are unfavourable as compared with the prices in the *mandi*. Conditions of marketing in the *mandis* are not always very attractive to the small producer. He gets less attention and there are a number of unauthorized deductions. He fails to understand the complicated sale system in the *mandi*. The development of regulated markets and improvements in the marketing facilities may gradually bring a change in the current situation.

**Regulated Markets :** Most markets in India were unregulated till recently. Once the farmer goes with his produce to the market for any dispute arising between him and the middleman or the purchaser, he has to depend on the decision of his broker and *arhatia*. The facilities for parking carts, drinking water, sanitation etc. are not good. There is considerable room for improvement in market places and sales procedures, system of payment of price, etc.

When the sales are not by the open auction system, the farmer's interest is often ignored. Even in open auctions, there may be a tacit understanding among the bidders not to bid high. For ending these malpractices, marketing committees with strong representation of farmer's interest are necessary. A number of unfair practices like short weights, unwarranted deductions and higher rates of commission and other market charges prevalent in most of the *mandis* take away a substantial share of the price paid by the purchasers and place the farmers at a disadvantage *vis-a-vis* the more organized section of the trading class. The purpose of law and regulation is to

improve competition, to strengthen bargaining power of the producer-seller and this ensures a fair deal to the farmer. During British times, regulated markets came into existence to help exports of industrial raw materials to Britain. But today the regulated markets have to pay a positive role in the orderly development of marketing.

**Co-operative Marketing :** Co-operative Marketing Societies help the farmer in getting maximum returns for the farm products. Co-operative marketing will strengthen the fibre of village life by making cultivators conscious that what used to be their weakness so far could be converted into strength by pooling their produce and selling it through their own organizations.

**State Trading :** The latest development is state trading in respect of foodgrains and certain strategic resources. The State can undertake trading activity if it is necessary for building up stocks and for distribution with a certain degree of social control. It may be recommended for a rational system of price stabilization to allow free trade on a competitive basis within certain broad limits and to regulate prices by suitable countervailing measures, overall as well as selective, by public authority.

Internal purchases of foodgrains on behalf of the Government are undertaken by the Food Corporation of India established in 1965.

**Place and Time of Sale :** Village sales account for the major part of marketed agricultural produce. The Rural Credit Survey found that in 1951 nearly 65 per cent of the total sales were made in the village. This is, however, only an overall position. Marketing studies carried out by the Marketing and Inspection Organization of the Government of India indicate considerable local variations. In Punjab, for instance, 35 per cent of paddy was estimated to have been brought to the assembling markets by cultivators as against only 3 per cent in some parts of Kerala. Direct sale by cultivators in the assembling markets depends on various factors. In some districts of Punjab with well developed means of transport and communication, about four-fifths of the wheat crop is sold by the grower directly in the assembling markets. On the other hand, in other districts of the same State which lack these facilities, the corresponding proportion is insignificant. A similar variation is prevalent among districts in Uttar Pradesh. In western Uttar Pradesh, about one-third of the local surplus is estimated to be taken to the assembling markets by the growers. This proportion is very small in the eastern districts.

In relation to time of sale, the important factor is the preponderance of sale soon after the harvest. Thus, in 1967-68, of the total market arrivals of rice and gram, more than 70 per cent arrived during the two quarters immediately succeeding the harvest. The corresponding figure for wheat was 68 per cent and *jowar* 55 per cent. The rush

of market arrivals in the post-harvest period has increased appreciably, particularly in the case of wheat as a result of the recent Green Revolution. Since these percentages refer to the arrivals in the wholesale markets, they would not fully reflect the extent of post-harvest sales in village markets owing to the carry over of stocks for some period by functionaries between the village and wholesale markets.

**Defects in Marketing :** The defects in marketing of agricultural produce can be classified into two broad groups. The first group consists of various types of malpractices prevailing in the markets, such as, (1) manipulation of weights and scales against the seller, (2) the practice of taking large quantities as sample, (3) arbitrary deductions from sale proceeds by the market functionaries under various pretexts, (4) sale under cover keeping the seller ignorant of price, and (5) discriminatory marketing charges. The extent of these malpractices varies from market to market and it is difficult to measure it with any precision. Some typical instances of these malpractices may be noted. The *arhatiyas*' commission is usually higher for small cultivators as compared to village merchants who, because of their larger turn-over, get better terms from the *arhatiyas*. This is also true of trade allowance or *karda*. Even in well organized markets like Hapur and Ghaziabad, the cultivators ordinarily pay twice as much as the charges paid by village merchants.

The second group of defects in marketing of agricultural produce arises out of inadequate facilities for transport and storage. This results in simultaneous existence of pockets of scarcities and surpluses leading to wide inter-regional variations in prices.

**Regulated Markets :** Legislation for regulation of markets was initiated in India in the thirties following the recommendations of the Royal Commission on Agriculture. In that decade, Madras, Central Provinces, Bombay, Mysore and the Punjab enacted the necessary legislation. This process, which was interrupted in the forties because of World War II, gathered momentum during the last decade and legislation for regulation of marketing was enacted in Madhya Bharat, Coorg and Orissa during the First Five Year Plan, and in Bihar and Rajasthan during the Second Plan.

Regulation of markets and market practices is now done under the Agricultural Produce Markets Act. The Directorate of Marketing and Inspection provides the necessary guidance and assistance to States in framing market legislation and its enforcement. Excepting the States of Assam, Kerala, Nagaland, Meghalaya and Jammu and Kashmir, all States have passed laws for market regulation. The total number of regulated markets and market yards at the end of March 1970, was 2,070; this increased to 2,131 by December 1970. During 1971, a study of regulated markets was undertaken to assess the faci-

lities that are needed to cope with the increased arrivals following increased higher production.

Legislation to regulate markets generally covers all the agricultural, horticultural, livestock and livestock products. The Act authorizes the State Government to establish a market committee for every notified area consisting of representatives of cultivators, traders, local bodies, co-operative marketing societies and the Government. The principal aim of the legislation is to ensure fair marketing conditions for cultivators through elimination of malpractices and unauthorized deductions. It stipulates the sale of produce through open auction in the presence of representative of the market committee. It provides for licensing of market functionaries, such as, commission agents with provision for revocation of licence if the market functionary is found to follow unfair practices. It also prescribes that no allowances other than those stipulated in the legislation will be levied. In addition to ensuring fair practices, the market committee heard disputes between buyers and sellers and gives decisions which would be binding on the parties.

Regulation of markets has been helpful in securing reduction in village sales, systematization of methods of sale and weighing and reduction in market charges. There has been a progressive increase in the produce brought to the regulated markets by the growers.

Apart from covering more markets by regulation, it will be necessary to expand facilities by way of market yards and other ancillaries in various markets. A recent study has shown that, in certain areas such as Punjab, during the post-harvest season of 1968-69, market arrivals increased by 150 per cent over the average of corresponding period in the three previous years. The capacity for market yards proved to be inadequate for these large arrivals and considerable market transactions began to be conducted outside the market yards, thus leading to malpractices. In this context, efforts are necessary for strengthening and restructuring the market committees with regard to their resources and functions. A beginning has already been made by some market committees to obtain bank finance for improvement of market facilities. It will be necessary to enable a large number of market committees to resort to such institutional finance and thereby help in the development of market intelligence. Some of the well developed market committees are also expected to make their contribution to the development of feeder roads for which a beginning has been made in a few rural areas. Finally, it will be necessary to evolve a suitable state level machinery for supervising and co-ordinating the work of regulated market committees. Several States are contemplating action to constitute State Agricultural

**Marketing Boards on the lines of those functioning in Punjab and Haryana.**

**Co-operative Marketing :** There has been considerable extension and diversification of the activities of the co-operative marketing and processing societies recently. The marketing operations of co-operatives have reached a level of nearly Rs. 600 crores. Co-operatives now account for one-third of the total production of sugar in the country. The value of fertilizers distributed by co-operatives during 1969-70 was of the order of Rs. 232 crores. The total storage capacity available in the co-operative sector is nearly 2.7 million tonnes. To help the farmers, co-operatives in recent years have been branching out into new lines of activities like production of granular fertilizer products, processing and distribution of seeds, manufacture and distribution of improved agricultural implements and setting up of agro-service centres.

The infra-structural activities for processing, storage and marketing of agricultural produce and for supply of agricultural inputs are being further extended to sustain the tempo of agricultural production. Emphasis is continuously being laid on streamlining the structure of co-operative marketing societies and strengthening their administrative machinery so that effective arrangements could be made for collecting the produce from the farmers directly, and selling it at terminal markets. The National and State Marketing Federations have also been directing their efforts towards developing an integrated marketing system in the co-operative sector. Working societies have been evolved with the Food Corporation of India to secure larger participation of co-operatives in the procurement operations of the Corporation for the benefit of the farmers.

The value of agricultural produce marketed by co-operatives was substantial in the state of Maharashtra, Uttar Pradesh, Gujarat and Punjab and these States accounted for about 74 per cent of the total value of agricultural produce marketed by co-operatives in the country during 1969-70.

## **XI. Labour**

Historically, the emergence of a sizeable group deriving its livelihood mainly from casual labour on land is a relatively recent phenomenon in this country. There was perhaps no distinct class of agricultural labourers before the 19th century because the traditional rural community was organized into a balanced agricultural and handicrafts economy. Land was not so scarce and the system of exchange labour took care of additional requirement of labour on *particular occasions*.

With the rapid increase in population, the pressure on available cultivable land became acute, leading to sub-division and fragmentation of holdings and further to the emergence of people without land depending mainly on labour for livelihood. They had either a very small holding or had no land at all. Simultaneously, the village crafts and cottage industries received a serious set-back, as a result of imports of cheap manufactured articles. A large number of persons lost their traditional occupation and sought refuge in agriculture. They mainly swelled the rank of agricultural labourers. Agricultural labour today occupies the lowest rung of the rural ladder. Social stratification in a village is linked with land and caste which govern status, economic power and political influence as much as the level of living. Owner cultivators with large holdings are at the apex. Agricultural labour is provided mostly by economically and socially backward sections, poor sections from the tribes also swell their ranks.

**Labour Population :** The decennial Population Census gives information regarding the number of agricultural labourers since 1901, but due to changes in concepts and definitions of census classification, figures for the successive decades are not comparable. According to the 1971 Census, the total number of agricultural workers (cultivators and agricultural labourers) engaged in crop production comes to 126 million, of whom 78.7 million are cultivators and 47.3 million agricultural labourers (Table XX). The corresponding figure for 1961 Census works out to 99.5 million cultivators and 31.5 million agricultural labourers. This implies a decline of over 20 per cent for cultivators and an increase of as much as 50 per cent in the number of agricultural labourers in 1971 over 1961. This indicates that hunger for land among the landless in India is growing. An analysis of the available data shows that in States, such as Andhra Pradesh, Bihar, Tamil Nadu, Uttar Pradesh and West Bengal, the number of landless labourers continues to be high and has grown during the past decade.

Bihar, where 38 per cent of the total working force constitutes landless cultivators, against 23 per cent in 1961, tops all other States in this respect. In Andhra Pradesh, the increase has been from 28.6 to 37.4 per cent, in Tamil Nadu 18.4 to 29.1 per cent, in West Bengal 15.3 to 25.7 per cent and in Uttar Pradesh 11.3 to 19.35 per cent.

On the other hand, Jammu and Kashmir, Nagaland and Himachal Pradesh have a very low population of landless agricultural workers. It is 1.44 per cent of the total working force in Nagaland, 3.12 per cent in Jammu and Kashmir and 4.25 per cent in Himachal Pradesh.

TABLE XX  
Total Workers And Agricultural Workers—1971

| State/Union Territory | Population | 2    | 3                                         | 4             | 5                                | 6              | 7                         | 8           | 9             |
|-----------------------|------------|------|-------------------------------------------|---------------|----------------------------------|----------------|---------------------------|-------------|---------------|
|                       |            |      |                                           |               |                                  |                |                           |             |               |
|                       |            |      | % of rural population to total population | Total workers | % of workers to total population | As cultivators | As agricultural labourers | Total (6+7) | 8 as % of (4) |
| 1                     | 2          | 3    | 4                                         | 5             | 6                                | 7              | 8                         | 9           |               |
| Andhra Pradesh        | 43.4       | 80.7 | 18.1                                      | 41.7          | 5.8                              | 6.8            | 12.6                      | 69.6        |               |
| Assam                 | 15.0       | 91.6 | 4.3                                       | 28.6          | 2.4                              | 0.4            | 2.8                       | 65.1        |               |
| Bihar                 | 56.3       | 90.0 | 18.0                                      | 32.0          | 7.6                              | 6.9            | 14.5                      | 80.6        |               |
| Gujarat               | 26.7       | 71.9 | 8.4                                       | 31.6          | 3.6                              | 1.9            | 5.5                       | 65.5        |               |
| Haryana               | 10.0       | 82.2 | 2.7                                       | 26.5          | 1.3                              | 0.4            | 1.7                       | 37.0        |               |
| Himachal Pradesh      | 3.4        | 92.9 | 1.3                                       | 36.8          | 0.9                              | 0.05           | 1.0                       | 76.9        |               |
| Jammu and Kashmir     | 4.6        | 81.7 | 1.4                                       | 30.0          | 0.9                              | 0.04           | 0.9                       | 64.3        |               |

(Millions)

The proportion of land-owner cultivators in these States is among the highest in the country—78.19 per cent of the working force in Nagaland, 71.6 per cent in Himachal Pradesh and 64 per cent in Jammu and Kashmir. This also testifies to their industrial backwardness.

The shift in the proportion of female workers between cultivators and agricultural labourers is particularly striking. Only 28 per cent of such workers have retained their main activity as cultivation and 46 per cent as agricultural labour. A similar trend is observed in almost all the States, except Himachal Pradesh, Nagaland, Manipur and Meghalaya, where the disparity in the female participation rate in cultivation is not so apparent. Even in these areas, excepting Nagaland, the proportion of workers in agricultural labour has shown a definite increase among the females.

The proportion of non-agricultural workers has increased from 30.5 per cent in 1961 to 31.4 per cent in 1971, the increase being accounted for mainly by female workers. The male working population, however, dropped from 35 to 33 per cent due to a larger proportion of workers being claimed by agricultural labourers. In absolute numbers, the non-agricultural male workers have gone up from 35.3 to 48.5 million, an increase of about 7 per cent.

**Problem of Identification :** Before any other measure relating to the introduction and administration of welfare measures exclusively for agricultural labour could be thought of, the foremost problem was how to identify the agricultural and rural labour amongst the composite setting of rural population. It is common knowledge that the rural population comprises the heterogeneous mass of persons who are agricultural and rural labour as well as holders of petty plots or cultivators of small plots on behalf of the rural owners or who augment their income by other avocations like carpentry, smithy, etc. in addition to working as agricultural labour. So it is very difficult to locate agricultural labour as such, if one has to go strictly by the narrow considerations of occupation only, because occupational structure in a village is over-lapping in character. No straightforward formula could thus be evolved which could provide a fool-proof solution to the problem of identification. The casual nature of employment, which keeps them shifting from one farm to another, further adds to the difficulty of identification.

By and large, various authorities concerned have favoured the criterion of income. The problem of definition also engaged the attention of two Agricultural Labour Enquiry Committees. The first Agricultural Labour Enquiry Committee (1950-51) defined agricultural labour as 'all those who were engaged as hired labourers in agricultural operations for 50 per cent or more of the total number

of days worked by them during the previous year". The basis of this definition was thus the quantum of hired employment during the period of any year. The second Agricultural Labour Enquiry Committee (1956-57) adopted income as a criterion for demarcating agricultural labour families. A person was deemed to be an agricultural labour if his or her major source of income during the previous year was an agricultural wage.

In these enquiries, a person was considered as an agricultural labourer if he followed anyone or more of the following agricultural operations in the capacity of a labour on hire or on exchange, whether paid in cash, in kind or partly in cash or partly in kind :

- (a) farming including cultivation and the tillage of the soils ;
- (b) dairy farming ;
- (c) production, cultivation, growing and harvesting of any horticultural commodity ;
- (d) raising of livestock, bees or poultry ; and
- (e) any practice performed on a farm as incidental to or in conjunction with the farm operations (including any forestry or timbering operations) and the preparation for market any delivery to storage or to market or to carriage for transportation to market of farm products.

The census enumerators defined agricultural labour as a person who works for wages in cash, kind or share (such as share of produce) on another person's land (on which he did not have any right, lease or contract) only as a labour without exercising any supervision or direction in cultivation.

Amongst the parties many have favoured that, in order to have as clearly defined and administratively convenient a programme of welfare amenities for agricultural labour as possible, it is necessary to identify such labour and to define it. As for the definition, a majority of the parties have favoured criterion of income adopted by the Second Agricultural Labour Enquiry Committee for more than one reason. Having examined the question thoroughly, the Committee on Labour Welfare (1969) recommended that agricultural labour be defined as one whose principal means of livelihood is wage income arising out of farm labour and other allied activities. This definition according to them is more rational and scientific because it also includes small and marginal land holders who are no better than agricultural labour.

**Character and Problems :** Agricultural labour is admittedly not homogeneous in character ; it reveals regional variations dependent on demographic, ecological, technological and other reasons. It is not a distinct type, but is mixed with such occupational categories as share-

croppers, cultivators, construction workers and other unskilled rural labour. Socially, it cuts across peasant groups in a village, though two dominant social groups, viz., scheduled castes and scheduled tribes, have always formed a majority. A point of difference between agricultural workers belonging to scheduled castes and scheduled tribes deserves to be noted. Scheduled castes have been more exposed to the forces of economic and social change through history. Scheduled tribes have been able to preserve in several areas their cohesive and relatively stable socio-agrarian institutions; a large number of them have settled down as agricultural communities. But in the areas which have recently opened up or been exposed for some time, the socio-economic institutions of both these communities are undergoing changes, some for the better, others not so healthy. Thus the issues connected with agricultural labour acquire an important social dimension.

There cannot be a uni-linear approach for improving conditions of agricultural labour. Remedies lie in bringing about fundamental changes in the agrarian structure and social relationship. Economic growth, and more especially the location of industry in smaller centres and in rural areas, is a recognized remedy, though it is essentially a long-term one. In the meanwhile, sheer population pressure and the numbers involved render any meaningful action difficult.

The problem of agricultural labour, perhaps in the context of agricultural wages or seasonal or disguised unemployment among agricultural labour, was first mentioned by the Royal Commission on Agriculture in 1928. The Commission observed that "the labour problem is, therefore, from the agricultural point of view a simple one to lessen the pressure on land. The essential condition for relieving pressure on land is, therefore, in our opinion, mobility". Despite these observations and the efforts made in industrialization, the pressure of labour on land continued to increase.

Though it would not be correct to say that no attempts were made before independence to improve the living conditions of rural India, it was only after independence that concerted efforts were initiated with the launching of a massive Community Development and Rural Works Programme. The Community Projects Programme, by its very nature had to be a composite one, and it could not isolate agricultural and rural labour from the rest of the population in rural India. Yet the plight of the agricultural labour in the realm of welfare amenities could not be ignored for a long time. It was necessary that, at least, preliminary attempts, to gauge and survey the welfare needs of rural and agricultural labour and their families

in matters like proper housing, hygienic surroundings, medical facilities, recreational amenities and the like, were made.

The 1946 Programme for the amelioration of labour conditions included as its components, fixation of a minimum wage for agricultural workers and a plea for an enquiry into their level of living. The results of the latter were to be used for formulation of measures to protect and improve agricultural wages. The Minimum Wages Act, 1948 was passed ; agriculture was included as one of the employments in the schedule appended to the Act.

**Labour Enquiry and the Plans :** The first ever attempt to assess the magnitude and problem of agricultural labour was, however, made with the constitution of the Agricultural Labour Enquiry in 1951. This was followed by another Enquiry in 1956-57. The first Enquiry was conducted to provide comprehensive data on essential aspects relating to conditions of agricultural labour, and the second for providing broadly a comparative picture of the conditions of agricultural labour in the country as between 1950-51 and 1956-57.

The findings of the Enquiry gave broad statistical support to the then prevailing notions about the conditions of agricultural labour that it was eking out its existence at the lowest level of incomes, and the primary cause of it was inadequate work and also low payment for whatever work was available. The average per capita income was Rs. 250 in 1950-51; for agricultural labour families, it was Rs. 104. The Enquiry pointed out that labour was employed only to the extent of about half its potentiality to work. Better enforcement of the Minimum Wages Act, 1948, could have been a partial remedy. When various forums during the First Plan discussed the problems of agricultural labour, they pointed out the inadequacy of the action taken in this regard. Economic development in rural areas through promotion of village industries was but only incidentally referred to.

The Second Plan (1956-61) viewed the problems of agricultural labour in the wider perspective of rural development programmes. It recognized the limitations of implementing the minimum wages legislation, but reiterated older remedies. Development and diversification of village industries, redistribution of land, provision of housing facilities, encouragement to labour co-operatives and promotion of scientific agriculture were some of its suggestions. A fresh Agricultural Labour Enquiry (the second ALE) was proposed; its results were expected to provide a firmer base for policies in the Third Plan (1961-66).

When the results of the second ALE (1956-57) were published, it became obvious that because of the changes in the concepts and definitions used, its conclusions could not be compared with those of the first. A detailed technical examination of the two reports by an

Expert Committee set up by the Planning Commission, reached the conclusions *inter alia* (i) the second ALE reflected the conditions of agricultural labour in 1956-57 better than the first ALE did for that category in 1950-51; (ii) no improvement or deterioration in the general conditions of agricultural labour over the period 1950-57 could be established but, (iii) in the light of the increase in per capita income in the country and absence of any marked improvement in the conditions of agricultural labour, an objective of planning in the context of the socialist pattern of society *viz.*, improvement in the levels of living of the lowest category of our working class commensurate with the total development of the economy, was far from being achieved.

The first step towards identification of the problems of agricultural labour including welfare problems was taken in August 1965, when an All-India Seminar on Agricultural Labour was organized by the Central Government. The Seminar adopted, *inter alia*, a number of recommendations relating to welfare of agricultural labour. These were: (i) the importance of allotting housing sites for agricultural labour, if, by mixing this up with rural housing, delays are likely, the farmer should be treated separately as a matter of higher priority; (ii) grant of free-house-sites to the agricultural labour, provision of interest free loans, if possible, or in the alternative concessional finance and cheap credit facilities for building houses should form a separate scheme altogether; (iii) welfare measures relating to drinking water, housing, medical facilities, rest-sheds, etc., as provided for under the Plantations Labour Act and other labour laws should be made applicable to the employers of at least big farms, employing 50 and more workers; (iv) enhancement of the existing provisions for granting stipends and scholarships to the children belonging to agricultural labour families; and (v) other welfare measures for agricultural labour to be considered after undertaking a pilot study to assess the benefits of various welfare measures already being enjoyed by the agricultural labour as part of the overall welfare programmes undertaken in the country for rural population.

**Co-ordinating Committee on Agricultural Labour :** The next step was to consolidate and co-ordinate the recommendations made by the Agricultural Labour Seminar on a national level. To achieve this, the Union Ministry of Labour, Employment and Rehabilitation established a Co-ordinating Committee on Agricultural Labour. It took a number of important decisions which, *inter alia*, included recommendations for labour welfare measures. It was considered that welfare centres for agricultural labour could be set up in the areas where colonization schemes for resettlement of agricultural labour had been undertaken. A Special Committee was formed to pursue this sugges-

tion further. The Committee also considered that the possibilities of improving the existing arrangements for grant of scholarships to children of agricultural workers should be explored in the light of the recommendations of the All-India Seminar on Agricultural Labour. It decided that a list of such projects where 500 or more workers had been employed as agricultural labour should be compiled and Labour Officers appointed to look after the welfare needs of those workers. The Committee also decided that big farms be identified to find out the possibility of making applicable certain welfare measures relating to drinking water, housing, medical facilities, rest-sheds, as are provided for under the Plantations Labour Act and other labour laws to such farms as employ 50 or more workers. Among the other decisions, that the Committee took, was that a detailed paper on a Rural Housing Scheme, including allotment of house sites and providing interest free loans or concessional finance for construction of houses to agricultural labour should be prepared. It also decided that a pilot study, to assess the benefits of various welfare measures applicable to agricultural workers, should be made. The Committee further suggested that the Director General, Factory Advice Service and Labour Institutes should be approached to study one or two aspects having a bearing on the safety, hygiene etc., of agricultural labour *vis-a-vis* use of pesticides, tractors, etc., on the health of workers.

**Improvement in Living Conditions :** Besides fixation of minimum wages for agriculture labour, the Third Plan laid emphasis more on provisions of employment than fixation and implementation of minimum wages. It was in this context that a Rural Works Programme was initiated. The programme, which was intended to harness large rural manpower resources for economic development, was to serve as under employment relief. Beginning modestly with the provision of employment for one lakh persons in the first year, the object was to reach a target of 2.5 million persons in the last year of the Plan. Implementation of the programme did not, however, proceed as originally expected and not more than 4 lakh persons could find employment in 1965-66.

The whole programme was then critically examined at a conference in 1965 while laying guidelines for the Fourth Plan. It was recommended that (i) the selection of areas for setting up a programme would be governed by employment considerations, but once the area was chosen, economic considerations should prevail in selection of projects, (ii) the Rural Works Programmes should be an integral part of local area plans in which local institutions should be duly involved and (iii) the administrative and technical organizations involved in the programme should be strengthened. Labour co-opera-

tives, and not professional labour contractors, should be entrusted with the execution of schemes.

In the three years, 1966—69, the programme was maintained more or less at the same level as in the last year of the Third Plan. It is now being proposed to make these programmes a part of the general programme for rural development. The Fourth Plan has thus laid emphasis on labour intensive schemes such as road building, minor irrigation, soil conservation, area development programme, irrigation, flood control and rural electrification. This is expected to enlarge non-farm rural employment and even relieve agricultural under-employment directly by providing employment to agricultural workers.

There are other schemes to assist marginal farmers and agricultural labourers like those of Small Farmers' Development Agencies, Marginal Farmers' and Agricultural Labourers' Scheme, Integrated Dryland Agricultural Development Scheme and Cash Schemes for rural development. Under the Marginal Farmers' Scheme, farmers (with holding upto one hectare) and agricultural labourers (whose wage income from agriculture exceeds 50 per cent) are to be assisted in 41 selected projects during 1970-71. Similarly, Small Farmers' Development Agencies have been created in a number of districts. Increasing support to such activities is likely to help economic development of the small farmers' families of which about 23 lakhs are expected to benefit from this scheme.

About 9,44,000 potentially viable small farmers and 3,01,000 marginal farmers and agricultural labourers have been found eligible for assistance under the Rs. 50 crore crash programme for rural employment. Of these listed farmers, 2,00,000 small farmers and 27,000 marginal farmers and agricultural labourers have been brought into the co-operative field. Short-term credit worth Rs. 562.39 lakhs was disbursed, besides Rs. 67.08 lakhs on medium-term and Rs. 192.59 lakhs on a long-term basis. The scheme for small and marginal farmers is intended to cover three million families. The Planning Commission has approved 46 projects under the Small Farmers' Development Agency and 42 projects under the Marginal Farmers' Agency.

The Commission is drawing up an integrated land redistribution and rural works programme with a view to removing the disabilities of small farmers and the abject poverty of the landless labour. The scheme, while aiming at redistribution of available cultivable area, will modify the strategy of rural development "to improve the absorptive capacities and productive capabilities of millions of small peasants". It may lay down the following guidelines for a land reform policy to be adopted by the States. No household ownership

holding will be larger than 8.09 hectares, or it may be 6.07 hectares in wet land and 10.11 hectares in dry land.

Non-land owning, non-cultivating households may not receive agricultural land released for redistribution. The land released through fixing a ceiling on holdings is to be distributed among households which have less than 2.02 hectares. If such a land redistribution policy is adopted, the Commission envisages that the difference in per capita land ownership between the smallest and largest household holdings will not be more than five times. The proposed scheme will reduce the number of rural people below the poverty line by about 25 millions. Instead of two-fifth of the rural population now living in abject poverty, this proportion may be reduced to about one-third.

Along with Governmental efforts, another movement being carried on through peaceful and non-violent means by Gandhian workers under the leadership of Acharya Vinoba Bhave aims at distribution of land to the landless. Since its inception in 1951, the movement has developed into an integrated programme and the philosophy of *Sarvodaya* which aims at reconstruction of rural societies and at placing agrarian relations on a more egalitarian basis. This philosophy has important implications for agricultural labour.

Land reforms have two aspects : one relates to the changes in the system of land holding through tenancy reform and abolition of intermediaries, and the other, to the system of land cultivation as affected by ceiling on land holdings, co-operative farming and distribution of land through official agencies or through other movements. Land to the tillers as a cardinal feature of the policy and land reforms have attempted to abolish forced labour which was imposed on small peasants and workers with no land of their own. Like other programmes, agrarian reforms and distribution of land have, however, not been followed up by a policy designed to protect and secure the interest of small peasants and agricultural labour. No tenurial reforms to protect interests of share-croppers have been carried out. The matter is now receiving the urgent attention of the highest authorities.

Among other Plan proposals and programmes that have a bearing on agricultural labour, the following may be specifically stated :

- (i) changes in the agrarian structure, including development of co-operative farming and land resettlement programmes ;
- (ii) industrial growth, and more specially diffusion of industry into small towns and rural areas ;
- (iii) provision of house sites for scheduled castes ;

- (iv) effective implementation of minimum wage legislation ;
- (v) creation of a special cell within Government for watching closely the progress of development programmes which have a particular bearing on the welfare and development of agricultural workers ; and
- (vi) study of special problems which concern them in different parts of the country.

## **XII. New Strategy And Green Revolution**

To the first stage of the new strategy belonged the Intensive Agricultural District Programme (IADP). The Grow More Food Campaign, started as early as 1942, had come in for criticism from all quarters. It was observed that "the movement had failed to arouse widespread enthusiasm. This was so because all aspects of rural life are inter-related and that no lasting results can be achieved if individual aspects of it are dealt with in isolation". It was also observed : "The food problem was attacked from the angle of material investments made in land, namely, wells, seeds, fertilizers, etc. Human beings who lived in the villages and cultivated the fields, were practically ignored".

As early as 1928, the Royal Commission on Agriculture had also pointed out that the demand for a better life could be stimulated only by a deliberate and concerted effort to improve the general conditions of the countryside. It was also made clear by it that the responsibility for initiating the steps in the direction lay with the Government.

**Intensive Agricultural District Programme :** The Intensive Agricultural District Programme, or the Package Programme, as it has popularly come to be known, found its roots in a Report that a team of experts of the Ford Foundation made in 1959. This team, invited by the Government of India, made a survey of India's agricultural problems and suggested practical ways for filling up the gap between food production and consumption. In suggesting an all-out effort in this direction, it outlined specific measures to be taken. The team's recommendation was that selected areas in the country, having the greatest potentialities for rapid foodgrains production, should be chosen for intensive agricultural development.

To exploit fully the production potential of some favourable areas, the Intensive Agricultural District Programme is being worked in selected districts which have the maximum irrigation facilities and minimum natural hazards. It aims at simultaneous provision of all the essential elements needed for increasing the production including credit to all participating cultivators for rapid expansion within a short time.

The programme sponsored during 1960-61, with financial assistance from the Ford Foundation, had the two-fold objective of (a) increasing food production in order to meet the existing shortage as well as to provide a base for more rapid economic development, and (b) demonstrating the most effective ways of increasing food production through concentration of resources, both human and material, and setting a pattern of extending such intensified agricultural programmes to other favourable areas having irrigation or assured water supply. The object was to promote the adoption of a combination of improved practices by the farmers by making available the needed where-withal of production like credit, seeds, fertilizers, pesticides, implements, etc. Each farmer is assisted to develop a crop production plan for his holding.

The programme is currently in operation in 17 districts in the country. The Ford Foundation is rendering technical support to five IADP districts, viz. Ludhiana, Thanjavur, West Godavari, Raipur and Sambalpur known as Innovative Districts, in planning, implementing, evaluating, and reporting on the programmes. The Indo-German Agricultural Project, Mandi, which was initially to have been implemented for five years was extended upto March 31, 1971. The Mandi-type project has also been extended to Kangra district from January 1967. For this project, the Government of the Federal Republic of Germany has supplied agricultural machinery, implements, fertilizers, etc., worth about Rs. 17.36 lakhs. A similar intensive agricultural project was undertaken in Nilgiris district of Tamil Nadu from January 1967. Besides services of a number of experts and technicians, the West German Government have provided agricultural machinery, implements, fertilizers, etc., worth about Rs. 12.14 lakhs for this project.

The success of the programme in the modernization of agriculture in the IADP districts is reflected not only in the generation of considerable demand for inputs like improved seeds and fertilizers and for plant protection measures, but also in the rising trend of productivity despite unfavourable weather conditions and occurrence of pests and diseases in endemic form. Among the important programmes introduced under the new strategy are the high yielding varieties programme, multiple cropping programme, and the Ayacut Programme.

The programme was initiated to demonstrate the most effective way of increasing production by the application of scientific know-how and set a pattern for extending such a programme to similar areas having an assured water supply and where conditions are favourable for intensifying efforts.

In the selected districts, an attempt is being made to provide all the essential elements for increasing production to the extent needed such as fertilizers, pesticides, improved seeds, and improved implements ; composite scientific demonstrations are being laid out on a large scale. Credit is being provided on a scale sufficient to reach all farmers including those previously considered not credit worthy.

Through Bench-Mark Survey and systematic evolution, high standards of performance are being insisted upon in these selected districts. The idea is that the districts, chosen for intensive development, should give to the agricultural and other services in each State special opportunities for developing improved methods for extension and for planning of agricultural production at the block and village level as well as in relation to the individual farmers.

While the performance varied a great deal among the different districts, the programme brought into sharp focus two elements of the strategy, namely, the efficacy of the inter-action of various improved agricultural practices conceived as a package and the advantage accruing from concentrated and co-ordinated efforts in areas with significant agricultural potential. From 1964-65 onwards, a similar approach—but with the extension staff on a reduced scale—was introduced in several other parts of the country through the Intensive Agricultural Area Programme which concentrated on specific crops.

**Intensive Agricultural Areas Programme :** One of the principal lessons of the mid-term appraisal of the Third Plan was the need to give more emphasis on the development of scientific and progressive agriculture in areas where a high agricultural production potential exists. The Agricultural Production Board accordingly agreed in January 1964 to select about 20-25 per cent of the cultivated areas in the country for intensive agricultural development.

This programme also follows the "Package Approach"—the use in agriculture of inter-related factors—physical, social, and institutional—in strategic combinations which are likely to produce an impact on agricultural production. It is also based on the fact that our earlier planning was defective because of our policy of dispersing our resources on too many schemes over too wide an area. A beginning was made in 1963-64. The programme, however, came into operation in March 1964, when field work was taken up.

The normal extension staff has been strengthened in these areas. Attention is also being given to strengthening and streamlining the administrative machinery, delegation of powers to various concerned officers for supporting this programme and provision of credit requirements of agriculturists. Construction of a large network of

rural godowns and supply depots, as an indispensable adjunct of the supply framework, was taken up on a top priority basis.

**New Strategy for Agricultural Development :** While the IADP and Intensive Development Area Programmes are being continued, the unprecedented drought of the two years 1965-67—and the biological revolution brought about by the introduction of new strains of various foodgrains, helped the country to embark upon a new strategy of agricultural development. The most important of the programmes under the new strategy are the High Yielding Varieties Programme, Multiple Cropping Programme, New Concepts of Irrigation, Ayacut Development and Water Management.

**High Yielding Varieties Programme :** During the two drought years of 1966 and 1967, when food production fell by 19 per cent, a mood of pessimism spread throughout the country. Few were then aware of the silent revolution which was taking place in the fields of the agricultural universities and research institutes in India.

A new technology of farming was under development using the dwarf and fertilizer-responsive strains of wheat and rice bred in Mexico, Taiwan and Philippines and the high yielding hybrids of maize, Sorghum and pearl millet bred in India.

After two years of rigorous testing, the Mexican wheat varieties, *Lerma Rojo* and *Sonora-64*, were found to be suitable for cultivation in the major wheat growing areas of the country. Similarly, Taichung Native-1, a dwarf rice variety from Taiwan and latter the Philippine variety IR-8 were found to perform very well in several parts of the country. In the case of maize, four high yielding hybrids, *Ganga-1*, *Ganga-101*, *Ranjit* and *Deccan* were released as early as 1961, as a result of the work carried out under the Co-ordinated All-India Maize Improvement Project of the Indian Council of Agricultural Research in collaboration with the Rockefeller Foundation. In Sorghum, the first hybrid CSH-1 was released in 1964, and in Pearl Millet, HB-1, a very high yielding hybrid developed at the Punjab Agricultural University, Ludhiana, was released in 1965.

These high yielding strains provided the raw material for the initiation of a synergistic package of practices under the high yielding varieties programme started by the Government in 1966. A nationwide Demonstration Programme was initiated in 1965 to introduce farmers to the new vistas in crop yields that were open to them. Because these new strains were capable of giving almost double the yield of earlier varieties when managed properly, they caught quickly the imagination of the farming community and a small developmental programme soon became a mass movement and acquired the popular epithet "Green Revolution".

The exotic varieties introduced under the high yielding varieties programme in its initial stages had several drawbacks. Hence, the first priority in research and developmental efforts had to be placed on the rectification of these defects. For example, the Mexican wheat, *Jerma Rojo* and *Sonora-64* had red grains and hence were not quite acceptable to the farmer and to the consumer. By selection from material sent from Mexico, a whole series of strains possessing fertilizer responsiveness, disease resistance and good grain quality were released in 1967 under the names of *Kalyan Sona*, *Sonalika*, *Chetti Lerma* and *Safed Lerma*.

Also, a variety named *Sharbati Sonora* developed by mutation breeding from *Sonora-64* was released in the same year. Proposals for the release of new high yielding varieties of wheat for commercial cultivation were recently considered at a workshop of all-India wheat research workers. A dwarf variety called *Durum* with good grain and yield potential of five tonnes per hectare has been developed. New high yielding varieties for dry farming have also been developed and some of them have been recommended for release by the workshop.

Similarly in rice, Taichung Native-1 and IR-8 had several drawbacks both with regard to pest and disease susceptibility and grain quality. By crossing the dwarf varieties with Indian rice strains possessing a good quality and pest resistance, a series of new varieties were released by the All-India Co-ordinated Rice Improvement Project under the names *Jaya*, *Padma*, *Jamuna*, *Sabarmati*, *Kanchi*, *Cauvery*, *Bala*, *Ratna*, *Krishna* and *Vijaya*. Further, a dwarf mutant in the popular Orissa rice variety T-141, was released under the name *Jagannath*. These varieties have been recommended for specific areas taking into consideration the duration of the crop that is desirable, the disease problems and the grain qualities liked by the farmers.

Rice production is dominated by the monsoon. On account of the dry climate in which wheat is cultivated there are no pest hazards. Rice, on the other hand, is attacked by many serious pests. Vast areas under rice remain inundated while other areas remain dry and are exposed to moisture stress. There are purely rainfed uplands where rice is grown with a minimum rainfall of 850-1,000 mm. On the other hand, there are areas receiving more than 4,000 mm. of rainfall. Not only does the total rainfall vary from season to season, but its distribution throughout the crop season also fluctuates unpredictably and it is the latter phenomenon which determines the yield variations.

Rice varieties show response to correct time of planting in each region. They complete their growth phase and come to flower at a

particular time of a year, if they are photo-sensitive, or may flower at the end of their growth period, if they are of low sensitivity. Both sets of varieties require adequate quantities of water when they are in flower. Investigations have shown that there is a critical phase in crop growth during which there is no adaptability to moisture stress. Since the major irrigation systems are also dependent upon adequate and timely rainfall in the catchment areas, monsoon will continue to dominate all rice production programmes in India. The future expansion in the area under high yielding varieties depends upon how rice scientists face the problem posed by the monsoon.

*Bala* and *Padma* evolved at CRRI, maturing in 85 and 105 days respectively under direct seeding, are good upland types. Evolution of upland types has been intensified at the Institute by adopting the latest techniques of breeding and selection procedures, and through an understanding of the physiology of the rice plant under moisture stress.

The next big task of rice scientists is the evolution of varieties which can tolerate about one or two feet of water during the growth stages, survive occasional flooding, and grow efficiently under water-logged conditions. This problem of evolution of suitable high yielding varieties for the *kharif* season involves an understanding of the basic physiology of the plant selection of suitable parents and development of appropriate breeding techniques. Physiologists and breeders at IARI are collaborating in this attempt. Within a few years, it is hoped that suitable varieties will be made available which may permit a dramatic extension of high yielding varieties in the *kharif* season.

High yielding varieties of paddy taken up for cultivation including Taichung Native-1, Taichung-65, Tainan-3, ADT-27, and IR-8 have given quite impressive yields in several areas. It has, however, been found that there have been shortfalls (20 to 30 per cent) in the achievement of targets of the coverage proposed for these varieties during the three seasons (*kharif* 1966 to *kharif* 1968). Amongst the factors responsible for shortfalls, apart from unfavourable seasonal conditions, susceptibility to pest attacks, inadequate plant protection measures, incomplete adoption of package of practices, consumer resistance etc., are quite important.

In Sorghum, the early hybrids, CSH-I and CSH-II had chalky grains and consequently, poor cooking and storage properties. This was due to the use of one parent, a male sterile source from the United States, which had a chalky endosperm. This defect was, however, soon remedied by transferring the male sterile character to Indian varieties and the first hybrid combining high

yielding ability and good grain quality was released in 1970 under the name CSH-III.

In addition, a high yielding variety of Sorghum, *Swarna* has also been released. In millet, three more hybrids HB-II, HB-III and HB-IV, have been released since the time HB-I was made available to farmers in 1965. A major problem in hybrid pearl millet is its susceptibility to diseases like ergot, downy mildew and grain smut. Fortunately, sources of resistance have been found and one hybrid HB-V, which shows relatively more resistance to ergot was to be released during 1971. In maize, a wide array of hybrids and composites are now available and recently three composites possessing a high lysine content have also been recommended for release.

Thus maize strains suited for child feeding, starch manufacture, unleavened bread making and for processing purposes are now available. Many more strains in all these crops which are being tailored to specific uses are currently in the breeders' assembly line.

**Multiple Cropping :** Since high yielding varieties are of short duration maturity as compared to traditional varieties, they increase the scope for multiple cropping. Development of irrigation, increased fertilizer use, adoption of water management practices and selection of proper crop rotations can help in raising additional crops both in mono cropped and double cropped areas. Where there is water, four or even five crops can now be grown in a year in multiple, mixed and relay cropping systems, getting for the farmer the benefit of nearly 450 days of crop growth in a year of 365 days. Even the limited work that has been done suggests that improved methods of water conservation and use and enrichment of soil fertility coupled with crop varieties capable of avoiding the rigours of drought or floods through changes in their length of life and co-ordinated pest control schedules, can open up new hopes for peasants working in environmentally handicapped areas. The Green Revolution in cereals has paved the way for developing harmonious systems of agriculture and animal husbandry. Available information from the States indicates that 1.89 million hectares were added to the gross cultivated area in 1969-70 and another 1.51 million hectares might be added during 1970-71 as a result of efforts to increase multiple cropping. To accelerate the tempo of progress of multiple cropping, the Government of India have sanctioned a Centrally sponsored scheme for the organization of Multiple Cropping Projects. Fifty-one pilot projects are proposed to be organized by the end of the Fourth Plan at an estimated cost of Rs. 3 crores. Under these projects, special attention will be given to adaptive research trials, water use and management works programmes, scientific demonstrations and training and audio-visual education. Attention will also

be given to arrangements for provision of credit, input supplies, marketing and other infra-structural aspects. A multi-agency approach involving active participation by all organizations and agencies concerned with agricultural development, such as State Governments, agricultural universities and research institutes, co-operatives, commercial banks and input suppliers, would be adopted under these projects.

**Development of Irrigation for Intensive Cultivation :** In the development of canal irrigation in the past, one of the main considerations was protection against drought. This meant large coverage with a thin spread of water availability. As a result, many of the areas in the command of canals do not get adequate irrigation water supplies for growing two crops. It was felt that through groundwater exploitation, specially developing tube-well irrigation in the command of irrigation projects, it should be possible to produce two or more crops in such areas. It has also been suggested that the tempo of exploitation of groundwater facilities should be accelerated.

Briefly, the new concept of irrigation implies providing adequate water allowance on new irrigation projects in accordance with the optimum requirements of crops, planning and designing of new irrigation projects for higher irrigation intensities, reducing the command area of State tube-wells and encouraging conjunctive use of surface and groundwater resources. Emphasis was also considered necessary on the development of groundwater on compact area basis providing for construction of tube-wells, installation of pump-sets, land development measures and other complementary inputs in a package form. The programme of groundwater investigations needed to be intensified for the development of groundwater irrigation on a rational basis.

Upto the end of the Third Plan, rural electrification programmes were drawn up with emphasis on the number of villages electrified. Since 1965, when it was decided to give higher priority to food production, rural electrification has been oriented to agricultural needs primarily and as such irrigation pump-sets and tube-wells are being energized on priority basis. In order to attain this objective, crash programmes were implemented with Central assistance. Against the Third Plan provision of Rs. 105 crores, actual expenditure on such programmes was more than Rs. 153 crores.

During the Fourth Plan period, additional 12.54 lakh tube-wells and pump-sets are likely to be energized, bringing the total figure to well over 23.37 lakhs. On the eve of the First Plan, only around 18,000 tube-wells and pump-sets were electrically operated and the

figures at the end of the Third Plan were in the neighbourhood of 5.13 lakhs.

Ayacut Development refers to water-utilization and management in areas recently brought under irrigation and can also cover areas newly reclaimed by flood control, drainage, and soil conservation measures. It implies planned development of agricultural production in those areas as a composite operation involving adoption of improved agricultural practices, land shaping, construction of channels, supply of inputs, and introduction of new cropping patterns. A water-utilization cell has been formed in the Agriculture Ministry. Special programmes are being undertaken in the Kosi Project, the Cauvery Project, and the Godavari-Krishna delta. A programme of intensive agriculture around tube-wells and other kinds of wells in two districts of Uttar Pradesh is also being undertaken. Assistance available for such projects from international aid-giving agencies such as the World Bank, would be utilized.

**Water Use and Management :** An important element in the new strategy for agricultural development is the scientific management of irrigation water and its well integrated use with other production inputs and services.

The optimum utilization of water available from irrigation projects involves the study of various factors including soil and climatic conditions and water requirements of various crops at different stages of their growth, in addition to drainage needs, etc. Accordingly, three regional soil and water management pilot projects were initiated in 1968-69 with the technical collaboration of USAID, one each in the Tungabhadra Project (Karnataka), Bhakra Project (Punjab) and Dohrighat Pump Canal Project, Azamgarh (Uttar Pradesh). During 1970-71, four more similar projects were sanctioned in Girna Command (Maharashtra), Kakrapara Command (Gujarat), Mahanadi Delta (Orissa) and Rajasthan Canal (Rajasthan). It was proposed to have one such project in each State during the period of the Fourth Five Year Plan. These projects are designed to demonstrate water management techniques so as to improve utilization of available water resources. Evaluation studies of the existing irrigation projects with a view to improving water use and water management were undertaken in Purnea, Kakrapara and Nizamnagar project areas.

Evaluation of sprinkler irrigation in order to find out its economics under Indian conditions for adopting it in the country was undertaken. A study was also undertaken to find the effects of loose sand and sand storms on the functioning of the canal system in the Rajasthan Canal area and to determine remedial steps to avoid silting of the system. On the basis of the findings of this study, afforestation and sand dune stabilization schemes estimated to cost about Rs.

1 crore have been sanctioned. Another study to determine the best cropping patterns and layout and design of land shaping and land levelling in the Tawa Command area is under way. Similar studies are proposed to be taken up in other irrigation projects. Technical literature in the form of bulletins having a bearing on soil survey and land classification, soil-water-plant relationships, lining of channels, irrigation of various crops, irrigation methods, estimating water requirements of various crops, etc., were issued by the Water Management Division of the Department for the use of State Governments, universities, research institutes, cultivators and extension workers.

**Evaluation of the Programme :** Foodgrains and some of the cash crops like cotton, jute, ground-nut and sugar-cane constitute practically the whole of our agriculture. In so far as the cash crops are concerned, although a number of high yielding and improved varieties have been introduced in the field, there is no impact on their output. Foodgrains occupy nearly three-fourth of the total cultivated as well as irrigated area in the country. High yielding varieties of wheat, rice, *jowar* and *bajra* were introduced during 1967-68 while those of maize have been in the field for a number of years. An analysis of the production of various foodgrains over the last 20 years indicates that while the production of total foodgrains increased at an annual compound rate of 2.98 per cent during 1949-50 to 1970-71, the average annual rate of increase during 1967-68 to 1969-70 is only 2.3 per cent and for the period 1967-68 to 1970-71 around 4.5 per cent.

A detailed study in respect of each of the foodgrains shows that but for wheat there is hardly any spectacular change in the growth rate of other foodgrains. The position in respect of *jowar* and pulses is perhaps the worst, both of which indicate just 17 per cent increase in their respective production levels during the last 21 years. There was, however, remarkable increase in the production of *bajra* and maize in 1970-71, so much so that the Fourth Plan target of 7 million tonnes for *bajra* has been more than achieved and the maize target of 8 million tonnes nearly achieved. But when the position regarding these two cereals is examined closely, it is found that a major part of these increases during the year 1970-71 was due to exceptionally good weather conditions which is difficult to sustain. These increases have taken place in most of the unirrigated States like those of Rajasthan, Gujarat and Uttar Pradesh.

Wheat production has no doubt nearly doubled from an all-time record level of 12.3 million tonnes during 1964-65 to 23.2 million tonnes during 1970-71. This is no small achievement; but even here it is found that of the 40 per cent increase in production during the period 1967-68 to 1970-71, not more than half (20 per cent) was a perma-

TABLE XXI  
Actual\* Foodgrain Production (1949-50 to 1970-71)

(In million tonnes)

| Year                 | Food grains | Rice | Wheat     | Jowar | Bajra    | Maize | Ragi | Small millets |
|----------------------|-------------|------|-----------|-------|----------|-------|------|---------------|
| 1                    | 2           | 3    | 4         | 5     | 6        | 7     | 8    | 9             |
| 1949-50              | 59.0        | 25.3 | 6.8       | 7.0   | 3.2      | 2.9   | 1.5  | 1.9           |
| 1950-51              | 53.4        | 22.2 | 6.8       | 6.2   | 2.7      | 2.4   | 1.4  | 1.7           |
| 1951-52              | 53.8        | 22.8 | 6.3       | 6.7   | 2.4      | 2.9   | 1.2  | 1.9           |
| 1952-53              | 59.7        | 24.5 | 7.6       | 7.4   | 3.0      | 3.5   | 1.3  | 1.9           |

ment change and has resulted from increases in per hectare yields. Of the remaining 50 per cent increase in production, as much as 30 per cent was at the cost of non-remunerative but much more important grains like gram, *rabi* pulses and oil-seeds etc. The remaining 20 per cent was the result of an increase in the area during 1970-71 over 1969-70 purely because of seasonal factors.

All this would indicate that the things as they stand, India has no doubt the wherewithal for sustaining the wheat revolution. With the rapid progress of rural electrification in eastern U.P. and Bihar, a major part of the northern wheat zone will be covered by high yielding varieties and it can be safely assumed that these regions which at present produce not more than half of the Punjab yields might also be able to catch up particularly in the irrigated areas. But as far as other crops are concerned, the results achieved so far do not indicate any significant improvement in production levels.

Attempts now being made to evolve varieties much superior to those already in the field can be expected to materialize in the coming few years. Again, as a result of thousands of new tube-wells that were installed primarily to aid the cultivation of high yielding wheat, many districts now have the supplementary irrigation needed to grow paddy, which is now emerging as a major monsoon crop in the wheat zone. In addition, the increased efficacy of pest control, water management, fertilizer application and drainage systems in the major paddy zones themselves are finally leading to a steady rise in the level of output per hectare.

### XIII. Crops

The cropping pattern of Indian agriculture is determined mainly by natural factors like rainfall and soil conditions. Technical factors like irrigation, improved varieties of seeds and the use of fertilizers effected the pattern only marginally till recently. With the introduction of the high yielding varieties, there has been some shift in the area under crops like wheat (Table XXIII). Market prices, no doubt, also cause marginal shifts in the land area devoted to different crops, but their overall effect is not pronounced.

For some individual crops like wheat, high yielding varieties have replaced old and inferior varieties in a major part of the irrigated area. Although the impact of the green revolution has not been evenly spread, wherever it has made itself felt, it has led to a new pattern in which farmers move in a continuous cycle from one new variety to another and from straight-forward cropping systems to those that are more complex. Multiple cropping is again the latest

TABLE XXIII  
Shift in the Area under Wheat 1964-65 to 1970-71

| State          | Changes area 1970-71 over 1967-68 |                 |                                    |                  | Changes area 1967-68 over 1964-65 |                 |                                    |                  |  |

trend in advancing agriculture. To grow more than one crop on the same land in the same year so that a variety of produce could be had from the land is the principle behind this new move. In a way, multiple cropping is the logical sequence of the high yielding varieties programme introduced in 1967-68. The innovative spirit of the individual farmers was exploited for introducing new crop varieties which were more prolific than the traditional ones and demand more attention from the farmer.

There are at the same time crops like indigo which have more or less disappeared as a result of the supply of synthetic substitutes. Among oil-seeds, ground-nut has made fairly good progress.

Foodgrains continue to predominate in the overall cropping pattern. In regard to the major crops (Table XXIV), the share of total foodgrains has gone up from 80 per cent in 1950-51 to 81.8 per cent in 1970-71. Among the foodgrains, cereals accounted for 66.9 per cent of the area during 1970-71 and pulses for the remaining 14.9 per cent. The share of the area under pulses has actually declined while that of foodgrains has increased during the 20 years of post-independence period from 1950-51 to 1970-71.

Rice is the staple food of a substantial section of the Indian population. Area under the crop has increased from 31 million hectares during 1950-51 to 37.4 million hectares in 1970-71. The impact of the introduction of high yielding varieties of rice has not been marked so far. The area under the crop during 1970-71 was 24.7 per cent of the cropped area as against 24.3 per cent during 1960-61. The next important crop from the consumer's point of view is wheat which improved its position substantially so as to occupy as much as 11.8 per cent of the area during 1970-71 as against 9.4 per cent during 1960-61 and 8.9 per cent during 1950-51. *Jowar* has now been relegated to the third position with 11.5 per cent of the area from 12.4 per cent during 1960-61. From among the other coarse grains, while *bajra* has maintained its share, maize has improved its position from 2.6 per cent during 1950-51 to 3.8 per cent in 1970-71. As against this, small millets and barley have lost much ground. Different coarse grains are grown in different regions but the cultivation of *jowar* and *bajra* is more widespread.

The principal non-food crops are cotton, jute, ground-nut and sugar-cane. Cotton, with 7.3 million hectares during 1970-71, shared only 4.8 per cent of the cropped area as against 5.4 per cent during 1950-51. Oil-seeds as a whole, constituting 10.1 per cent of the area were being grown on 15.3 million hectares during 1970-71. Nearly half of this area was occupied by ground-nut alone. Jute in which

India had a world monopoly before partition occupies just 0.5 per cent of the cropped area.

Among vegetables, potato has a place of pride and along with other vegetables has accounted for 0.3 per cent of the area. Plantation crops like tea, rubber and coffee, some dry fruits like cashew-nuts and spices like black pepper are highly valued crops. Bulk of them is being exported to earn the much needed foreign exchange. But they occupy a very small proportion of the land under cultivation.

**Regional Distribution :** Data on crop areas are available according to the administrative divisions of the country although crop zones in many cases cut across them (Table XXV). For instance, rice is grown in coastal areas with heavy and assured rainfall, both in the eastern and the western States. Regions which have ample supply of irrigation water also grow rice and they are located in most of the States. Important rice growing States are Andhra Pradesh, Bihar, Madhya Pradesh, Orissa, Tamil Nadu, Uttar Pradesh and West Bengal. Recently water-logged areas in Punjab and Haryana have also come under rice. Here rice is of the nature of a cash crop and this northern region has now emerged as an exporter of rice on a large scale.

Wheat is generally grown in black loamy soil in the *rabi* season as a winter crop. The October rain or supply of rain water is necessary for its growth. The central and northern parts of the country grow wheat in large areas, although it is primarily restricted to Haryana, Madhya Pradesh, Punjab, Rajasthan and Uttar Pradesh. The crop is also grown in parts of Bihar in the east and Gujarat and Maharashtra in the west. Wheat is now being introduced on a sufficiently large scale in West Bengal where the area under the crop during 1970-71 was as much as 320 thousand hectares.

Coarse grains are grown in Western India and the interior regions of the southern tract. Important *bajra* growing States are Rajasthan and Gujarat. Maharashtra also grows *jowar* but *bajra* is relatively more extensively grown in this State.

Cotton is an important crop in wheat and coarse grains zones and alternates with wheat, *jowar* and *bajra*. Important cotton growing States are Gujarat, Maharashtra, Karnataka and Punjab. Madhya Pradesh, parts of Tamil Nadu and Andhra Pradesh are also quite important but superior quality cotton is restricted to Punjab, Gujarat, Tamil Nadu, and Andhra Pradesh.

Jute is being cultivated primarily in the eastern region where there is heavy rainfall. While West Bengal accounts for nearly half of the area under jute, Bihar and Assam are also quite important

TABLE XXV  
Area, Production and Yield of Foodgrains—1970-71

Area (A) : 000' hectares  
Production (P) : 000' tonnes  
Yield (Y) : Kg. per hectares

Note: Figures in bracket represent per cent of All-India for area and yield as Index with All-India equal to 100.

in this respect; Orissa and Uttar Pradesh are developing this crop now.

Oil-seeds are being cultivated in the coarse grains zones along with or in places of cotton. As for ground-nut the most predominant States are Gujarat, Andhra Pradesh, Tamil Nadu, Maharashtra and Karnataka. More than one-third of the total area under ground-nut is occupied by Gujarat and Maharashtra and another one-third by the three southern States of Andhra Pradesh, Tamil Nadu and Karnataka.

The traditional sugar-cane growing regions are Uttar Pradesh and Bihar. More than 50 per cent of the area under the crop is in Uttar Pradesh. The second position in the area as well as production of sugar-cane is now occupied by Maharashtra. Bihar has now been relegated to the third position in the total area under the crop. Other important sugar-cane growing States are Haryana, Andhra Pradesh, Punjab and Tamil Nadu.

Tobacco is grown in Andhra Pradesh, Gujarat and parts of Karnataka. The superior quality of virginia tobacco is, however, found only in the southern States of Andhra Pradesh and Karnataka. Gujarat tobacco is used primarily for *bidi*, *hookah* and snuff manufacturing. Tea gardens are located at high altitudes in mountainous areas in the southern and north-eastern regions.

**Crop Production and Yields :** In spite of big strides made in the past few years under the high yielding varieties programme land productivity in India is still low. This in a way indicates a sizeable potential for increasing production. On the other hand, it also indicates the amount of efforts in terms of investment that would be required to achieve internationally comparable levels. The vast gap in unit yields of various crops is apparent from the comparable data for other countries.

**Wheat :** The production of wheat in the country had nearly doubled between 1966-67 to 1970-71. Average yields also increased from 851 kg. per hectare during 1960-61 to 1,229 kg. per hectare in 1970-71 (Table XXVI). In certain selected States like Haryana, Punjab and West Bengal, the average yield is more than 60 per cent higher than the all-India level. A district like Ludhiana in Punjab today is producing above 30 quintals per hectare against the Punjab average of 22.2 quintals per hectare.

Nearly 50 per cent of the total production of wheat in the country is being produced in Uttar Pradesh and Punjab. Uttar Pradesh alone accounts for one-third of the total production. But yield levels in Uttar Pradesh are just the same as those obtainable at the all-India level. There is thus a huge potential for increasing the production of wheat in the country. There are quite a number of other new high

TABLE XXVI  
Area Under Production and Yield Of Different Foodgrains

| Crop                | Year    | Area    | Production | Yield | Index with 1950-51=100 |            |       | Share in total foodgrains |            |
|---------------------|---------|---------|------------|-------|------------------------|------------|-------|---------------------------|------------|
|                     |         |         |            |       | Area                   | Production | Yield | Area                      | Production |
|                     |         |         |            |       |                        |            |       |                           |            |
| 1. Rice             | 1950-51 | 30,810  | 20,576     | 668   | 100                    | 100        | 100   | 31.66                     | 40.49      |

Area : 000' hectares

Production : 000' tonnes

Yield : Kg. per hectare

yielding varieties like Triple-Geni Dwarf, *Heera*, *Moti*, HD-1925 and HD-1977 which are superior to well accepted varieties like *Kalyan-Sona*. These varieties not only give higher yields but also do not lodge at higher dose of nitrogen.

**Rice :** There is not much improvement in the production or yield levels of rice as wheat. With 1950-51 as base, the index of rice production increased to 168 during 1960-61 and 205 during 1970-71. Corresponding figures for yield are 152 and 170 as against 128 and 196 for wheat. Against the all-India average yield of 1,134 kg. per hectare during 1970-71, yields in Tamil Nadu were 74 per cent higher and those of Punjab, Karnataka, Jammu and Kashmir and Haryana around 50 per cent higher. Andhra Pradesh and Tamil Nadu alone account for nearly one-fourth of the total production of rice in the country. Another one-third, is shared by the eastern States of Assam, Meghalaya, Bihar, West Bengal, Manipur and Tripura.

The new high yielding varieties of rice already evolved have failed to usher in the green revolution for rice. Rice is a *kharif* crop which is raised mainly when the sky is cloudy and enough sun is thus not available. Field studies have indicated that a proven high yielding variety like IR-8 has performed better in Punjab when raised as a *rabi* crop than in the heavy monsoon areas like Orissa and West Bengal where paddy cultivation takes place during the *kharif* season.

Research is still going on to evolve some better varieties to respond to the local requirements in different parts of the country. Latest field trials indicate that IR-20 has proved more successful than IR-8 on several counts. Not only does it give an additional yield of 2 tonnes per hectare, it has also better grain quality and has a broad spectrum of disease resistance. Similarly, two other promising fine grain rice varieties—*Sabarmati* and *Jamuna* have been evolved.

**Pulses :** Pulses have actually suffered as a result of the green revolution. Unfortunately, the foodgrains which imbibed the benefits of the new technology were making inroads on the area under pulses in recent years; and to some extent the area under oil-seeds too, which are another major source of protein. The fact that cereals and pulses are mutually substitutable can aggravate the shortage of pulses and oil-seeds in particular years. Mustard, *mung*, *urad*, linseed, gram and peas are also interchangeable with wheat in different parts of the country. When the demand for cereals goes up and the relative net price differential is favourable, the farmer is tempted to prefer wheat instead of the less remunerative pulses crop. That this has happened frequently and extensively is indicated by the figures.

The index number of area for wheat (base-1949-50 : 100) rose to 163.5 in 1968-69, the figure for maize to 174.1 and for rice to 120.4.

For pulses it was only 106.7. For gram, however, it actually dropped to 85.7. *Tur* has fared better than gram, having moved up to 108.1, which, in relation to the major cereals, is low. All the other pulses together approximated to 120, which is just short of the point reached by rice.

Recently some new varieties of pulses like *mung* have been evolved. *Mung* G-65, for example, which matures in 65 days and contains 28 per cent protein has yielded nearly 20 quintals per hectare at the research farm. Since pulses can be sandwiched between the wheat and the main *kharif* crops like rice and maize, there is a possibility of an increase in the area under them several fold without effecting the area under other crops. Similarly, the Rajasthan Agriculture University has evolved a new variety of *urad*—*Krishna* which matures in 90 days and has 22 per cent protein content. This has given 30 per cent higher yield as compared to the local variety. With a new emphasis now placed on the importance of pulses, the Union Government has sent detailed instructions to the States to formulate action programme to increase the production of pulses.

The strategy envisages the adoption of a package approach in large areas under irrigation and assured rainfall where rapid returns could be obtained with the available improved varieties. This could particularly be achieved in respect of *arhar*, gram and pea crops which have a capacity to yield about 2.5 tonne per hectare. It is proposed to cover an area of 8.52 million hectares which will yield an additional 1.43 million tonnes.

**Coarse Grains :** Although the production of coarse grains like *jowar*, *bajra*, maize, barley, etc. has not made much progress, they together constitute nearly 30 per cent of the total production of food-grains in the country. The share of *jowar* has been reduced from over 10 per cent during 1950-51 to 7.6 per cent during 1970-71. Production of maize and *bajra* has, no doubt, shown a tremendous increase during 1970-71 but this has primarily been due to exceptional weather conditions (Tables XXVII & XXVIII). Otherwise in spite of the introduction of high yielding varieties of *jowar*, *bajra* and maize, much progress does not seem to have been made in their production.

Rajasthan and Uttar Pradesh produce nearly one-third of the total coarse grains in the country. Gujarat, Madhya Pradesh, Maharashtra and Karnataka produced another 38 per cent of the coarse grains during 1970-71 and the balance was shared by the remaining States. In States like Punjab, coarse grains are being substituted by superior grains such as wheat and rice.

**Cash Crops :** Important cash crops in the context of Indian agriculture are cotton, jute, oil-seeds and sugar-cane (Tables XXIX & XXX). Of late, there has been stagnation in the production of cash crops, particularly cotton and jute, in respect of which the peak levels were reached in 1967-68 and have never since been surpassed despite various package programmes initiated by the Centre. Cotton production in 1970-71 was just 4.6 million bales as against 5.7 million bales during 1964-65 and per hectare yield has come down from 122 kg. to 108 kg. during this period. More or less same is the position of jute where the production came down from 6.3 million bales during 1967-68 to 4.9 million bales during 1970-71. The present yield is only 1,177 kg. per hectare as against 1,293 kg. in 1967-68. The production of ground-nut at 6.1 million tonnes is just a shade higher than the 1964-65 level and same is with regard to yield in spite of the fact that the current year was the best with regard to natural factors. The production as well as yield of sugar-cane is also lower than the levels achieved during the last few years.

**Cotton :** The important cotton growing States in the country are Gujarat (34.5 per cent), Punjab (18.1 per cent), Maharashtra (10.6 per cent) and Haryana, Maharashtra and Tamil Nadu (over 7.5 per cent each). Although India occupies nearly 25 per cent of the world area under cotton, the yields are the lowest as compared to those in the major cotton growing countries like the U.S.S.R. and the U.S.A. With a view to boosting the production of cotton and doing away with the country's long dependence on imports, Government has approved a three-year programme costing Rs. 14.74 crores. This programme would popularize the use of improved seeds of new varieties, application of recommended doses of fertilizers and adoption of plant protection measures. Six districts have been selected in the irrigated zone : Ferozepore and Bhatinda in Punjab, Hissar in Haryana, Ganganagar in Rajasthan, Baroda in Gujarat and Coimbatore in Tamil Nadu. It is proposed to cover a total of 5.6 lakh hectares on cotton cultivated area in these districts. Demonstrations of farm holdings in these areas show that cotton production can be stepped up by 40 to 100 per cent.

In non-irrigated areas, it is proposed to initiate a programme on a pilot basis in approximately 140,000 hectares spread over seven districts in different States. These are Kurnool in Andhra Pradesh, Surendranagar in Gujarat, Khargon in Madhya Pradesh, Akola and Yeotmal in Maharashtra, Dharwar in Karnataka and Tirunelveli in Tamil Nadu. Baroda and Surendranagar account for about 30 per cent of the total area under cotton crop and about 35 per cent of the total production of cotton in Gujarat. The per hectare yield in

these districts, which has gone up by about 50 per cent over the three plan periods reached 202.5 kg. in the Baroda and 136 kg. in the Surendranagar districts in 1965-66.

The irrigated areas for cotton are spread over some 55 districts of the country. More than half of the areas are located in a few sizeable blocks in Punjab, Rajasthan, Haryana, Gujarat and Tamil Nadu. The areas are not only compact, but also offer potential for raising yield levels.

**Jute:** More than 50 per cent of the jute production in the country comes from West Bengal alone and another 36 per cent from Assam and Bihar. Orissa produces 6 per cent followed by 2 per cent in Uttar Pradesh and 1 per cent in Meghalaya. In spite of the development schemes for jute, average yields have remained stagnant over the last many years. The development programmes for jute have, therefore, been accelerated and are likely to get a further boost through much larger outlays in the remaining period of the Fourth Five-Year Plan. The Government has also set up an Action Group to formulate an intensive jute development programme.

**Oil Seeds:** India had been the world's premier supplier of vegetable oils and fat some 30 years back. Now it is unable to meet even the needs of internal consumption. In the early sixties the per capita availability of 4kg. compared very unfavourably with the world average of 10 kg, and the optimum nutritional needs of 20 kg. The availability has since declined further. In the planning decades, the output of oil-seeds has increased at an annual rate of 2.2 per cent. The growth in the sixties had declined to mere 0.32 per cent a year. With the growth in population of 2.5 per cent a year, it is inevitable that per head availability should decline and find reflection in continually rising prices.

In order to achieve a breakthrough in raising the production of ground-nut by extending intensive cultivation programmes to large areas, a Centrally sponsored scheme was first implemented in three States. In 1971-72, the target had been fixed to cover 2.25 million hectares covering 17 States. A subsidy of 25 per cent, on plant protection chemicals besides the entire cost of additional staff is being met by the Union Government. This entails financial assistance to the tune of Rs. 101.71 lakhs.

Recently, two short duration and high yielding varieties of castor *Aruna* and CCH 3 have been evolved. The demonstration was first organized in 1969-70 and was continued during 1970-71. Encouraged by the performance of these new varieties, it is proposed to experiment on an area of 1,721 hectares in 14 States. A sum of

Rs. 125 per hectare for rain-fed crop and Rs. 200 per hectare for irrigated crop will be provided.

In order to increase the production of castor, a Centrally sponsored scheme was introduced in 1970-71 in Andhra Pradesh, which has the largest area under the crop in the country. The coverage of the target for 1971-72 for the package programme was 40,000 hectares for *kharif* and 6,000 hectares in *rabi*. Production of pure seed and demonstration was to be taken up during 1971-72 at an estimated cost of Rs. 1.50 lakhs. Similarly, a scheme to increase the production of rape-seed and mustard-seed has been envisaged at a cost of Rs. 9 lakhs.

Apart from arranging demonstrations for the production of soyabean at a cost of Rs. 3.03 lakhs, a Centrally sponsored scheme has been drawn to bring four lakh hectares of land under this crop.

**Sugar-cane :** The production of sugar-cane in terms of *gur* fell from 12.8 million tonnes in 1965-66 to 9.5 million tonnes in the following year. Since then, production progressively rose to 13.4 million tonnes in 1969-70, but in 1970-71 it again declined to 12.3 million tonnes. Of the total production in the country, Uttar Pradesh alone accounts for 42.2 per cent, although yield in the State is just 82 per cent of the all-India average. Highest yields come from Karnataka, Tamil Nadu and Maharashtra which account for 6.4, 8.7 and 12.7 per cent respectively of the total production.

#### XIV. Population and Food Supply

According to the 1971 Census, the population of India is 547.4 millions, which accounts for 15 per cent of the world's population. She has, on the other hand, only 2.4 per cent of the world's land area with low levels productively. This would explain the crux of the problem of population and food supply.

In the last 70 years, every succeeding decade has ended up, by and large, with a higher net growth rate of population compared to the previous one. So much so, the total population stood more than doubled during the last 70 years. The last decade (1961-71) witnessed the phenomenal growth of 24.66 per cent. At a compound rate of growth of 2.5 per cent this is not very much different from the one experienced in the last decade. India's population will be doubled by the end of the present century.

This rapid growth of an already very large population poses a serious challenge to India's agriculture. It has not only to feed these growing numbers but also to provide raw materials for the country's growing agro-based industries and, particularly for those which enable it to earn the much needed foreign exchange for carrying through other developmental programmes in the country.

Since independence food production has expanded rapidly ; but the rate of increase in demand for foodgrains generated as a result of increase in population and rising income has outstripped the rate of increase in foodgrains' production. During 1950-51 to 1970-71 the country had imported 64 million tonnes of cereals.

Although the index of food production with 1950-51 as base, has gone up to 182.7 during 1970-71 against a population index of 152.7, the food supply position is not quite easy in respect of all types of foodgrains. Even otherwise, population index as compared to the food production index stood higher right upto 1966-67. Food imports were the lowest during 1955-56 at 1.4 million tonnes and increased steadily to reach the highest peak level of 10.4 million tonnes during 1965-66 (Table XXXI). Thereafter, as a result of increase in production, imports have been on the decline. At one time it had even been announced by the Government that all concessional imports of foodgrains would come to an end after 1971. Since Indian agriculture is susceptible to weather conditions, there will always be fluctuations in production. As a result, the country did face a series of bad seasons like between 1965 and 1967.

Besides providing adequate food and proper clothing as the basic necessity for the people, Indian agriculture also provides the means of livelihood for practically the whole of the rural population. Since foodgrains occupy as much as 75 per cent of the cultivated land and employ perhaps 72 per cent of its agricultural labour force for its production, higher levels of food production constitute an important aspect of agricultural development programmes. The Five-Year Plans have placed a good deal of emphasis on this aspect. Available data on foodgrains' production since 1951 show that nearly half of the increase is due to extension in area and the other half due to increase in productivity. Ever since the introduction of high yielding varieties during 1966-67, there have been sharp increases in the production with hopes of abundance in the near future. Wheat production has, no doubt, more or less doubled but the same is not the case with regard to other foodgrains. The annual growth rate for the period 1967-68 to 1970-71 has been negative for *jowar*, minor cereals and pulses (Table XXXII). The Fourth Plan target of 7 million tonnes for *bajra* was over-achieved during 1970-71 and that for maize was near the target. The position

TABLE XXXI  
Population and Food Supply

| Year     | Population (Mid-Year) |       | Production of Foodgrains |                                      | Imports | Net Availability         |                 | Per Capita Availability |        |

about rice which is the most important food crop of India is not that satisfactory. In eastern, central and southern India rice is the staple food and if it is available in plenty, the people would consume it in preference to other foodgrains. Consequently, there is always a pressure on rice stocks. Planning for food production has to take into consideration this important aspect.

The future food problem in a nutshell will, therefore, be of a restrictive nature in the sense that it would involve a specific emphasis on the production of rice and pulses. With regard to rice, varieties have to be evolved suitable for the different agro-climatic zones. As regards pulses, the position is a little complicated. The area under cultivation is about 17 per cent of the total cultivated land in the country and yet the highest production level so far achieved has not exceeded 12 million tonnes in the best year. The position remained more or less unchanged during first three Plan periods. Little attention was paid to the development of pulse cultivation and no serious efforts were made to overcome the limiting factors. Since most of the pulses are grown on unirrigated lands, they have invariably depended on the vagaries of the monsoon. Again, with the introduction of the high yielding varieties, foodgrains which imbibed the benefits of new technology, have made inroads on the area under pulses.

Recently some efforts have been made by research workers and there are some possibilities for increasing the yield of pulses particularly during the *kharif* season through control of pests. In *kharif moong* alone, the yield could almost be doubled through pest control measures.

**Self-Sufficiency :** The objective of self-sufficiency in foodgrains as the goal to be reached through increased foodgrains' production was first announced early in 1949. The deficit to be made up by the end of March 1952, was at that time calculated at 4.9 million tonnes over the level of production in 1947-48 on the basis of the then prevailing level of consumption. The target for additional production of foodgrains was, therefore, fixed at 4.9 million tonnes. Production targets for foodgrains under the First and Second Five-Year Plans were drawn up with a view to reducing the large gap between internal production and consumption requirements, the deficits proposed to be made up being 7.7 million tonnes and 10.2 million tonnes during the five-year periods 1951-56 and 1956-61, respectively. The Second Plan target of additional production of 10.2 million tonnes of foodgrains was revised to 15.7 million tonnes after the publication of the Plan. The objective of self-sufficiency was reiterated either explicitly or implicitly while fixing the Third Plan and the original Fourth Plan (1966-71)

targets of 102 and 132 million tonnes to be attained by 1965-66 and 1970-71, respectively. The revised Fourth Plan (1969-74) target of 129 million tonnes of foodgrains' output to be attained in 1973-74 provided (though this is not explicitly stated) for the requirements for addition to buffer stocks and pipelines stocks and some exports too.

Among the reasons for continued deficits in foodgrains despite increased production, one could put an unrealistic estimation of demand also. For example, the deficit of 4.9 million tonnes estimated under the 1949 plan of self-sufficiency was based on the projected net requirements for the 1952 population at the same per capita availability as in 1947-48 from internal production as well as from imports. The implied assumption was that the entire additional qualities produced would be available for consumption and not even the usual allowance for seed, feed and wastage was made. The First Plan target of foodgrains production too was based on a stable level of per capita consumption as in 1949-50. Under the Second Plan, for the first time, increase in per capita consumption, taking into account the increased incomes generated by the Plan, was allowed for. However, the population estimates originally contemplated went wide off the mark and thus even the revised target of 82 million tonnes, which was actually achieved, did not meet the internal requirements fully. Foodgrains production in the last year of the Third Plan, *viz.* 1965-66, was adversely affected by severe drought and consequently it slumped to 72 million tonnes whereas in the previous year, *viz.*, 1964-65, output reached the record level of 89.4 million tonnes. Again, during the years 1967-68 and 1968-69 although the production levels reached were 95.1 and 94.0 million tonnes respectively, these were considerably below the targets envisaged under the original Fourth Plan (1966-71). In consequence, India continued to import cereals despite the emphasis given to the food production programmes in the successive Plans.

**Nutritional Requirements :** With self-sufficiency as defined in the previous section, it may be assumed that the country has reached a level of near self-sufficiency in cereals, particularly when all concessional imports are to be stopped and Government stocks at over 9 million tonnes as at present are the highest on record. The problem, however, remains with regard to the provision of a nutritively balanced diet to the people. According to the recommendations of Nutritional Advisory Committee, the foodgrains requirement in a balanced diet of an adult male in India is 397 grams of cereals and 85 grams of pulses per day. The balanced diet includes several items of what are known as protective foods such as milk, meat, eggs, etc. Since these protective foods are not being produced, at

present, in quantities adequate for balanced diet, a large majority of the people have to make up for these deficiencies by additional consumption of cereals. This would call for a further addition to the quantities of cereals recommended by the Nutritional Advisory Committee.

It has been estimated that the daily per capita requirements of the Indian population for a reasonably satisfactory level of nutrition would be 2,100 calories of energy and 61 grams of proteins per day. As against this, the per capita, per day availability of cereals and proteins as at present are of the order of 2,000 calories and 48 grams respectively. The average Indian diet today contains only 5.6 grams of animal protein which constitutes only 9.1 per cent of the necessary protein intake. In affluent societies, nearly half of the protein intake is in the form of animal protein. Allowing for wastage of food between availability at the retail level and the cooking, the minimum nutritional target for the country may be placed at 2,370 calories and 66.6 grams of protein, including 10 grams of animal protein per day per adult. Dr. P.V. Sukhatme has worked out the least cost combination of major food groups needed per head per day on the basis of this minimum level. The quantities so worked out along with quantities currently available are given in the Table below. According to Sukhatme, one in every four of India's people appears to be underfed and two out of every four are malnourished.

TABLE XXXIII

Per Capita Quantities of Major Food Items Available and  
Needed to Meet Minimum Nutritional Target

| <i>Item</i>            | <i>Quantity per day (gm.)</i> |               |
|------------------------|-------------------------------|---------------|
|                        | <i>Available</i>              | <i>Needed</i> |
| Cereals                | 394                           | 403           |
| Pulses and nuts        | 51                            | 104           |
| Starchy roots          | 39                            | 46            |
| Sugar                  | 44                            | 50            |
| Fruits and vegetables  | 58                            | 137           |
| Meat                   | 4                             | 7             |
| Fish                   | 1                             | 17            |
| Eggs                   | 3                             | 2             |
| Milk and milk products | 116                           | 201           |
| Fats and oils          | 9                             | 18            |

This indicates the deficiencies in regard to each item of the minimum nutritive diet. The deficiencies are particularly large in respect of pulses and protective food items like fruits and vegetables, milk, meat and eggs. If these deficiencies are to be made good concurrently with the requirements of additions to the population, agricultural production, including that of poultry and animal husbandry will need to be substantially stepped up. Efforts now being made to meet this challenge are special programmes for the development of poultry, piggery, livestock and horticulture etc. Although the progress with regard to livestock development is not very encouraging, poultry and piggery development can be expected to develop much faster particularly when maize and other coarse grains are available in quantities at reasonable prices. With regard to horticulture, States like Himachal Pradesh have had a real breakthrough. The area under apple cultivation, for example, has progressively increased from 1,214 hectares in 1956 to 42,700 hectares in 1971. The Government is now pursuing a Rs. 45 crore World Bank project to boost fruit cultivation and production. Processing and marketing is being pursued by the Government. A cold storage, the largest of its kind in India, is nearly complete at Delhi.

A 15-year horticulture development plan has been drawn up under which one-third of the total cultivable area of Himachal Pradesh will be brought under horticulture at the rate of 8,094 hectares per year. An Agricultural Refinance Corporation for financing the planting of apple orchards by individuals is also being set up.

**Consumption and Purchasing Power :** The actual consumption by an individual or a family or a section of the population depends not so much on average availability but its purchasing power. A detailed study of one region (Maharashtra) revealed that in the year of the study (1958), only when the total monthly expenditure reached Rs. 13 to 18 per person, the dietary intake amounted to 2,170 calories with proteins intake of 60.4 grams of which only 2.9 grams consisted of animal proteins. In the region concerned, 60 per cent of the people lived on income level below Rs. 18 per head per month. This emphasizes the need not only of producing more food but also producing it at costs which should preferably be lower than the prevailing.

The problem of food and nutrition focussed attention of the Planning Commission for the first time in the Fourth Five-Year Plan which attempted to set out an integrated nutrition programme. Some of the measures recommended by the Plan are :

- (a) Improvement of staple foods.
- (b) Production of unconventional protein foods.
- (c) Nutrition education.
- (d) Special measures for vulnerable groups.

The outlays on nutrition programmes in the various sectors are as follows :

TABLE XXXIV  
Outlay on Nutrition

| <i>Sl. No.</i> | <i>Department</i>          | <i>Central sector</i> | <i>States sector</i> | <i>Total</i> |
|----------------|----------------------------|-----------------------|----------------------|--------------|
| 1.             | Health and Family Planning | 5.13                  | —                    | 5.13         |
| 2.             | Community Development      | 13.90                 | 2.10                 | 16.00        |
| 3.             | Food                       | 13.05                 | —                    | 13.05        |
| 4.             | Education                  | —                     | 5.00                 | 5.00         |
| 5.             | Social Welfare             | 6.00                  | —                    | 6.00         |
| 6.             | Total                      | 38.08                 | 7.10                 | 45.18        |

Recently under the high yielding varieties programme new seeds being evolved contain more of protein or lysine content. In the case of wheat and rice the total available protein content has been increased. The recently released varieties of *Shakti* and *Rattan* maize are said to be almost as good as milk. Because of the high lysine content, maize has high quality protein. Feeding tests conducted with the new varieties of maize have shown that children fed on them become as strong as those fed on milk.

#### XV. Animal Husbandry and Dairying

Cattle in India pose a difficult problem at a time when the economy is rapidly growing and agriculture is required to play a leading role. Mixed farming in India enabled products of land to be fully utilized for both human and animal feed. This situation is now slowly changing. Finer rice and wheat for which demand is rapidly rising are poor yielders of fodder. On the other hand, milk consumption is below nutritional level and with increasing income and population the total demand for milk tends to rise. The religious traditions discourage cattle slaughter. Weeding of cattle is, therefore, done by nature through malnutrition which is indiscriminate in its impact. This keeps down quality without adequately controlling the number. Without mechanization and rural transportation, the farmer depends on bullocks and the use of cattle as a source of draft power and supply of organic manure still dominates. With expanding irrigation and double cropping, there is an increasing pressure on demand for cattle for which the present cattle population, despite its

large number is ill-equipped. A beginning has been made under the Five-Year Plans to improve systematically the quality of cattle with the long-term objective of increasing output of cattle products with proportionately less feeding costs.

**Livestock Population :** The total livestock population in India consisting of cattle, buffaloes and other small animals like goats, sheep, etc., was 343.8 millions according to the Livestock Census for the year 1966 Table XXXV. The bulk of the livestock consists of cattle and buffaloes, which together accounted for 67 per cent of the total. Numerically, the livestock population in India, judged on the basis of cattle and buffaloes only, is one of the largest in the world. According to 1951 data, India had about one-fifth of the world's total cattle population and one-half of the total buffalo population. Though cattle in India were then three times more than buffaloes, India was probably the world's most important buffalo-rearing country. Indian cattle and buffalo population accounted for over 68.5 per cent of the total number in the Asian continent.

TABLE XXXV  
Livestock Population : 1945—1966

|                   | 1945    | 1951                 | 1956    | 1961    | 1966    |
|-------------------|---------|----------------------|---------|---------|---------|

| Others            |         |                      |         | 22      | 30      |
| Total livestock   | 267,505 | 292,218<br>(293,595) | 306,504 | 336,428 | 343,868 |

*Note :* Figures in brackets are comparable in coverage with those of subsequent Livestock Census.

Looked from another angle, India carried in 1951 nearly 35.1 per cent more cattle and buffaloes than Europe including U.S.S.R., or about 21.7 per cent less than that in vastness of the cattle and buffalo population when we consider that India has a substantial proportion of population which does not eat meat and also the fact

that the geographical area of India is much smaller than the continents of Europe or America. This inevitably puts a heavy pressure on India's limited land resources. Countries like Denmark have a larger density of cattle and buffalo per square km. than India and countries like New Zealand, Argentina and Australia have a larger ratio of cattle population to human population.

The total livestock population increased by about 28.5 per cent during the 20 years from 1950-51 onwards. During 1950-51 to 1955-56 the increase is more spectacular in the case of work animals e.g. mules (41.6%), camels (13.9%) and goats (16.1%). Male buffaloes have increased by 6.6 per cent while the female buffaloes have increased by 4.5 per cent only. The cattle population has increased only marginally.

Male cattle are useful for work in the field or for transport while male buffaloes are used mainly for breeding, except in a few States where they are used for work. Consequently, the number of male cattle is larger than that of cows, but in the case of buffaloes females outnumber males. Again, the ratio of young-stock to cattle is relatively higher than that of young-stock to total buffaloes. This would imply larger waste of young-stock of cattle, probably caused by religious inhibition against killing cows.

**Livestock in Rural and Urban Areas :** Livestock population is proportionately much larger in rural areas, since the occupation of animal husbandry is largely combined with cultivation of land. However, owing to inadequate transport facilities for carrying fresh milk over long distances, a part of the livestock population is located in towns and cities. Besides, in cities, horses are used for drawing carriages and bullocks for carts for local transport of goods. In 1956, of the total livestock of 306.5 millions in the country, 11.9 millions or about 4 per cent were in cities and towns, the rest were in rural areas.

Nearly 6 per cent of the total poultry birds are maintained in urban areas. In 1956, out of total 94.7 million poultry birds in the country 5.5 million birds were in urban areas.

**Work Animals :** Ploughing of land in India is done traditionally with the help of bullocks. Cows are rarely used, since it is supposed to affect adversely their milking capacity. Buffalo males are slow and inactive. They have, however, a capacity to withstand wet weather. For this reason, they are employed for cultivation of land in high rainfall areas and for load carrying, especially for

carrying water. The statistical details of the work animals in India during the decade 1956-66 are given in the following Table.

TABLE XXXVI  
Work Animals

|                                       | <i>(In thousands)</i> |        |        |
|---------------------------------------|-----------------------|--------|--------|

| Working males                         | 5,953                 | 6,645  | 6,972  |
| Males used for breeding and work both |                       | 493    | 620    |
| Working females                       | 420                   | 487    | 386    |
| Horses and ponies                     | 1,482                 | 1,327  | 1,148  |
| Mules                                 | 40                    | 52     | 75     |
| Donkeys                               | 1,054                 | 1,096  | 1,054  |
| Camels                                | 775                   | 903    | 1,028  |

**Dairy Animals:** Bovine animals—cows and buffaloes and to a small extent, sheep and goats—are used for milking. According to the 1966 Livestock Census, there were 20.97 million cows and 12.92 million buffaloes in milk in India. Animals in milk increased by about 18 per cent during 1945-61 but the increase over the next 5 years was only marginal—1.05 per cent for cows and 3.7 per cent for buffaloes. Human population during this period increased at a faster rate. But as the increase in cattle led to increased pressure on fodder supply, the increase in the number of dry cattle was faster. The proportion of dry and wet calved cows increased from 53.6 per cent

in 1945 to 55.7 per cent in 1961 and over 61 per cent in 1966. The percentage of dry buffaloes increased even faster—from 42.9 to 46.5 during 1945-61 and over 47 per cent during 1966. The problem of dry cattle has thus become more serious.

A cow yields on an average 187 kg. of milk per year during the lactation period. A buffalo yields a much larger quantity—499 kg. per year—of milk with a higher fat content. Substitution of cows by buffaloes for increasing milk supply is economical and this process has already begun. Weather conditions and availability of grazing land determine the proportion of cows and buffaloes in different regions. Even in the same State, buffaloes predominate in some districts and cows in others. In Uttar Pradesh, Andhra Pradesh, Madhya Pradesh, Gujarat and Maharashtra buffaloes are relatively more numerous. In Bihar, West Bengal, Tamil Nadu and other States the proportion of cows is larger.

**Slaughter Stock :** Beef eating among Hindus is prohibited by religion. Hence the demand for beef is low and it fetches relatively low price, with the result that mostly unserviceable cattle are slaughtered. Buffalo meat being coarse and disagreeable to the general taste of meat-eaters, the demand is low.

**Distribution among States :** Uttar Pradesh with 14.5 per cent of cattle and 21.8 per cent of buffaloes is at the top. With regard to cows and bullocks, Madhya Pradesh comes a close second with 14.3 per cent. Its position is fourth in respect of buffalo population. The second position with regard to buffalo goes to Andhra Pradesh. Maharashtra comes third with regard to the population of both cows and buffaloes. Rajasthan has 7.6 per cent of both cows and buffaloes. Punjab, while it possesses 8.5 per cent of buffaloes (males over three years being quite insignificant), has only 3.7 per cent of cows and bullocks, between cows and bullocks the latter predominate.

Variations in the number of cattle from State to State are due to climate, grazing facilities, and the area under fodder crops which determine to a great extent the quality of cattle and the carrying capacity of land. Agricultural development, introduction of irrigation, reclamation of land, etc., affect adversely the livestock as the land available for grazing is reduced and the cultivated area under fodder and feed crops does not go up correspondingly, resulting in the reduction of total livestock feed. Both from the viewpoint of quality and number, important states for livestock are Rajasthan, Punjab, Uttar Pradesh, Madhya Pradesh and Andhra Pradesh.

As regards other animals, nearly 60 per cent of sheep are almost equally distributed in the three States of Rajasthan, Andhra Pradesh and Tamil Nadu. A little more than 50 per cent of the goats are found in Rajasthan, Maharashtra, Bihar and Uttar Pradesh, 65 per

cent of horses and ponies are in Uttar Pradesh, Madhya Pradesh and Maharashtra. Mules are mainly in Uttar Pradesh and Punjab, camels in Rajasthan and Punjab and donkeys in Uttar Pradesh, Rajasthan and Maharashtra.

**Breeds and Breeding :** One of the reasons for the low quality of cattle is unsatisfactory supply of breeding bulls. A bull with average health conditions can service 60 cows in a year. The number of cows per breeding bull was 77 in 1951 and increased to 119 in 1961. Regarding buffaloes, the situation was only slightly better ; number of buffaloes per bull was 70 in 1951 and 59 in 1961.

There are only 25 well defined breeds of cattle and these are found only in certain parts of the country. These breeds account for less than 20 per cent of total cattle. The pure breeds are mostly indigenous and are preserved by communities of cattle-breeders known as *ahirs*, *rabaris*, etc. The traditional cattle-breeders are now facing a challenging situation. They are hemmed in by extension of cultivated areas and find their traditional source of fodder supply shrinking. Besides, they have to migrate during summer to places near river beds with perennial supply of green grass. These places are marshy and have no satisfactory arrangements for drinking water. On their way from their original location to places of fodder supply, the cattle have to face difficulty in shelter, water and feed conditions. The traditional breeders are, therefore, gradually becoming extinct.

Among well defined breeds, there are two broad divisions, those which may be described as dairy breeds and those that are purely for draught, though there is a good proportion which produce a fair quantity of milk as well as bullocks of average working efficiency. The well known milch breeds of cows are *Ahtwal*, *Sindhi* and *Gir* while *Amritmahal*, *Mangayam*, and *Kankrej* are breeds noted for producing good bullocks. The *Hariana* and *Tharparkar* are the best known dual purpose breeds of India. *Ongle* and even *Kankrej* can be described as dual purpose breeds.

The well known buffalo breeds are *Nili Rani* and *Murrah* from Punjab and Delhi and *Mehsana*, *Surti*, *Jaffarabadi* from Gujarat.

**Cattle Prices :** Cattle prices vary from place to place and breed to breed. In view of the large number of breeds and variations among them, their classification and gradation for market purposes is difficult. Besides, the standard of evaluation vary from buyer to buyer, occasionally being influenced by fancy for a specific colour and auspicious marks. The price differentials are, therefore, associated not only with age, sex, utility or type, but also with non-economic considerations. By and large, the price of a young animal upto the

age of 3 years is low as it is comparatively raw and untrained. Prices begin to appreciate between the 4th and 7th year in case of draught cattle and thereafter begin to decline. Recent data regarding prices are not available. However, at present the price of a good *Kankrej* pair of bullock would be about Rs. 1,500 (at age of 6 years). For non-descript breeds it may be as low as Rs. 400 (at age of 6 years).

In the case of dairy cattle, the price is directly proportional to milk yield and varies with the number of lactations. Usually a higher price is paid for a milch cow in her first and second lactation and for a buffalo in her third and fourth lactation.

Cattle prices also fluctuate from season to season, the reasons being different for draught and dairy cattle. For draught cattle, the prices rise at the commencement of agricultural operations when the demand for the plough bullock is at its maximum level. Supply predominates in the slack season due to fodder scarcity and the price falls. The period of commencement of the agricultural operations—especially *rabi* operations—varies from region to region and crop to crop. In wheat growing areas, the autumn prices would be slightly higher than those in spring; and in cotton areas, prices would be higher in June than in November. In the case of dairy cattle, prices rise and fall depending upon the regularity of milk supplies. Prices of slaughter stock are generally low after January or February when the influx of unwanted animals from rural areas begins due to increased scarcity of fodder during these months.

Though buffaloes form only 38 per cent of the milch animals, they contribute 54 per cent to the total milk production compared to 42 per cent contributed by cows. This is explained by the fact that on an average, a buffalo yields 499.4 kg. of milk.

**Animal Husbandry Development:** The Third and subsequent Annual Plans attached considerable importance to animal husbandry. A new cattle breeding policy was evolved during this period. According to this policy, cross breeding would be undertaken in areas covered by Intensive Cattle Development (ICD) projects and in key village blocks that lie in the milk sheds of existing and proposed dairies. Pure breeding would be confined to outstanding indigenous breeds in well defined breeding tracts with a view to improving the quality of milch cattle. Simultaneous upgrading of indigenous cattle would be undertaken with recognised Indian breeds. Greater efforts would be made for the improvement of the productivity of buffaloes.

The introduction of ICD projects during the period 1961–69 represents a significant development. The programmes include improved methods of breeding, provision of feed and fodder and disease control. Earlier, the cattle development programmes, taken

up in small and scattered areas, could not make much impact on account of insufficient inputs, lack of tie-up with proper marketing and inadequate coverage of cattle population. The ICD project was conceived to rectify these short-comings.

**Objectives and Targets :** The approach to livestock development in the Fourth Plan is based on three major considerations. First, it is estimated that only about 12 per cent of the agricultural component of the Gross Domestic Product is accounted for by livestock production in India. The second consideration is nutritional. Compared with cereals, the demand for livestock products is more income elastic and it is likely to grow at a rate between 5.5 to 6.4 per cent per annum. The third major consideration is that animal husbandry offers considerable scope for diversification of the economy of the small farmer and the landless labourer.

In the light of these considerations, the Fourth Plan aims at increasing the supply of protective foods like milk, milk products, meat and eggs and at improving the output of certain animal products of commercial importance, such as wool, hides, skins, hair, bristles and bones. It is also one of the principal endeavours of the Plan to help ensure that animal husbandry programmes strengthen the economy of sub-marginal farmers and agricultural labour.

In setting up targets of livestock development, consideration has been given to the constraints that are still operating in this sector. The first major constraint concerns absence of a significant research break-through comparable to that in cereal crops. The second constraint concerns feed and fodder, while the third arises from the fact that a large percentage of the bovine population has to provide draught power for agriculture, thus leaving relatively limited scope for a milk oriented cattle breeding policy. There is also lack of sufficient integration between crop husbandry and livestock production with the result that these programmes do not adequately reinforce each other. Again, there is the limitation arising from an intense competition for land and water resources. An extremely small area is devoted to fodder cultivation and pasturage. Certain animals, particularly sheep, are reared by nomadic groups moving up and down the mountain ranges in the Himalayas or from arid to semi-arid tracts in the plains. In these circumstances, a continuous and consistent programme of extension and improvement of quality of animals becomes doubly difficult.

The public sector outlays are proposed to be supplemented from various institutional sources. The Agricultural Refinance Corporation (ARC) has already financed several poultry and dairy development schemes. It is expected that, in the coming years, the role of the ARC in this sector would be enlarged. Another significant

source of finance particularly for purchase of milch animals is co-operative credit. The All-India Rural Credit Review Committee had recommended that such credit should also be available to persons who carry on animal husbandry activities without undertaking crop husbandry. The measures are expected to increase the flow of co-operative credit and, in particular make it accessible to small farmers and landless labour for their poultry and dairy activities.

**Cattle Breeding Policy :** The main features of recent cattle breeding policy are :

- (i) Selective breeding in the breeding tracts of established or recognized milch, dual purpose, or some important draught breeds of cattle.
- (ii) Laying more emphasis on milk production in the breeding tracts of draught breeds or types of cattle and replacing the other existing draught breeds or types with dual purpose breeds.
- (iii) Grading up with recognized dual purpose or dairy breed in areas where cattle do not conform to any specific type of breeds and are usually non-descript and of low productivity.
- (iv) Cross breeding with exotic breeds in hilly areas and other places where there are facilities for the rearing and maintaining of high yielding milch cattle and urban areas and around industrial townships to ensure adequate supply of milk.
- (v) Improvement of buffaloes by selective breeding in breeding tracts and grading up with recognized breeds in other areas where buffaloes have established themselves.

The main emphasis of the new cattle breeding policy is on cross breeding. 8.5 lakh animals were bred by artificial insemination and 1.75 lakhs by natural services during 1970-71. The rate of progress in this respect will, however, depend upon the degree of the farmers' acceptance of cross-bred humpless animals as working stock. While a measure of progress has already been achieved in cross breeding, certain technical problems in regard to exotic inheritance are yet to be finally resolved, so as to achieve a measure of stability in the desired characteristics.

**Intensive Cattle Development Programmes :** With the object of increasing milk production particularly in milk shed areas of large dairy plants, the establishment of Intensive Cattle Development (ICD) projects were started from 1964-65. Thirty-four ICD projects were established upto the end of 1968-69. During the Fourth Plan it is envisaged to set up 37 such projects. Ten projects were set up in 1969-70 and 6 more in 1970-71.

The availability of proven bulls is a pre-condition for the improvement of breeds. During 1970-71, 8.5 lakh animals were bred

by artificial insemination and 1.75 lakhs by natural services. 2.64 lakh castration and 63 lakh prophylactic vaccinations were performed. A beginning has been made with the progeny testing units. In the Fourth Plan, a Centrally sponsored scheme will provide for progeny testing units at 10 State farms. For cattle development, schemes in the Third Plan and the Annual Plans included breeding farms, bull rearing farms, *goshala* development, control of wild and stray cattle and organization of mass castration. These programmes will continue. Three central cattle breeding farms and eight bull rearing farms will be set up. Sire evaluation cells will be established in each State.

However, the ICD project has yet to make a significant progress. A conference of the project officers held in October 1970 made special mention of two difficulties *viz.* inadequacy of funds provided by the States and non-availability of adequate quantities of seeds of high yielding varieties of fodder.

**Buffalo Development :** The demand for the buffalo as a dairy animal has increased in recent years on account of the high yield and rich fat content of its milk. Of the eight well defined breeds of buffalo, the *Murrah* breed, which is the most popular among the high yielders, has adapted itself well all over the country. An important scheme, continued from the Second Plan relates to the salvage of *Murrah* buffalo calves from milk colonies for distribution all over the country. In the Fourth Plan, an All-India Co-ordinated Research Project on buffaloes is envisaged. The objective is to improve the production potential of buffaloes through assessment of vital characters, selection for high economic value and development of breeds with the help of different systems of breeding. Research is in progress for overcoming the reproductive failures among buffalo cows during summer months. Some causes have already been identified. Further research work is contemplated in the Fourth Plan.

**Sheep and Goat Development :** The clip of Indian sheep is generally of coarse quality and the bulk is classified as carpet wool. Wool and wool products such as carpets, blankets and druggets earn valuable foreign exchange. Considerable quantities of the indigenous wool are being utilized in the woollen manufacturing industries. There is also demand for raw wool in the export market. To improve the quality of wool from indigenous sheep, the development programme envisages cross breeding of local sheep with exotic fine wool varieties as well as upgrading with some of the important local breeds. To produce quality stud rams of important indigenous breeds of sheep and exotic breeds, the programme envisaged establishment of 8 large sheep breeding farms with a flock strain of 5,000 or more sheep, expansion and reorganization of 15 State sheep breeding farms, establishment of 5 new sheep breeding farms and 30

sheep and wool extension centres besides the expansion of 80 centres established during the Third Plan. A large central sector sheep breeding farm is being set up at Hissar with Australian assistance. Australia has already supplied 1,030 corriedle sheep as part of the foundation stock, besides providing the services of experts and agricultural equipment for land development. Import of fine wool breeds of sheep and mutton types is envisaged to popularize improved method of sheep shearing, wool grading and marketing on the basis of the quality. The programme is being taken up in 8 States with UNDP assistance. It is proposed to organize farms for *Pashmina*, Angora and dairy goods.

**Poultry Development :** With the growth of poultry as a commercial enterprise during the last decade, poultry farming has become lucrative. The Agricultural Refinance Corporation has already provided finance for poultry projects. A favourable atmosphere has been created for the growth of ancillary industries such as organized poultry feed, poultry equipment and sales organizations for eggs and dressed birds. Propagation of stock with high feed conversion efficiency is important for bringing down costs. It is proposed to take up a co-ordinated poultry breeding programme at three Central and ten State farms to evolve superior lines and to cross them in various combinations with a view to exploiting hybrid vigour. One hundred intensive egg and poultry production-cum-marketing centres will augment supplies. The State Governments have been asked to set up State level organizations in the co-operative and corporate sectors to take up marketing of eggs and poultry on modern and scientific lines.

**Piggery Development :** Development of piggery is becoming increasingly important. Pig breeders are being supplied improved pigs and technical know-how in piggery development blocks. In some areas, supply of balanced feed for pigs has also been taken up. In order to improve the economic condition of those who have adopted pig rearing as a traditional occupation, it is proposed to supply them breeding stock at subsidized rates. The bacon factory at Haringhatta will be provided additional facilities. Work would be completed in remaining three bacon factories and one pork processing plant. Four more plants are proposed to be set up in different States. To ensure regular supply of improved pigs, 10 piggery farms would be expanded and 25 new piggery development blocks would be set up.

**Feed and Fodder Development :** Increase in the productivity of livestock has been hampered by shortage of feed and fodder. Only about 4.5 per cent of the cultivated area is under fodder. This is

not capable of supporting more than a small fraction of the livestock population. Stress will be laid on developing feed and fodder resources under the ICD projects and key village blocks. In 1970-71, 10,874 quintals of good quality seeds of fodder crops and 234 lakh roots/steps of perennial grass were distributed for cultivation purposes. 51,659 fodder cultivation demonstrations were organized. For meeting emergent requirements, it is proposed to set up 5 fodder banks in suitable areas where the available grass production will be harvested and conserved. It is also proposed to popularize silage and hay making by organizing demonstration on cultivators' holdings in the milk sheds of dairy projects. Seven regional forage demonstration stations will be set up. Of these, three stations at Hissar, Kalyani and Ankleshwar have already started and one more station has been selected at Alamadhi (Tamil Nadu). Foundation seeds will be multiplied at 20 seed farms.

**Livestock Marketing :** Marketing of livestock and livestock products has not developed to the same extent as that of other agricultural commodities. Marketing activities have been confined to regulation of cattle markets and to some extent to the grading of livestock products. Improvement in the conditions of marketing is an immediate need and regulation of markets would be an important step in this context. It is proposed to establish a livestock marketing cell in the Directorate of Marketing and Inspection with the object of developing effective supervisory and advisory control over the grading schemes for livestock products. In addition to this, other schemes proposed are classification of raw hides, improvement in the collection, preparation and grading of material used for manufacture of animal casings and arrangement for grading of wool at producers' level.

**Animal Health :** Maximum production can be ensured only when animals are healthy and protected against diseases and parasites. It is proposed to set up 200 new hospitals, 1,000 veterinary dispensaries and 2,000 stockman centres and to provide 60 mobile dispensaries. The five hundred existing dispensaries will be converted into hospitals and 60 clinical and investigation laboratories established. In addition to the continuance of the rinderpest eradication campaign in the southern States and the follow up programme in others, the immunization programme against the disease will be intensified by establishing check-posts and creating an immune zone to a depth of about 20 kilometers at inter-state borders. It is proposed to augment the production of tissues culture vaccines against rinderpest and foot and mouth disease and cross-bred animals are more susceptible to these diseases than indigenous breeds. To prevent ingress of exotic diseases, an animal quarantine and certification service will be set up.

**Research :** The two Central research institutes namely, Indian Veterinary Research Institute (IVRI) Izatnagar, Uttar Pradesh, and the Central Sheep and Wool Research Institute, Avikanagar, Rajasthan, were transferred under the administrative control of the Indian Council of Agricultural Research in 1967. The existing research facilities at both the institutes are proposed to be strengthened and a new plant, Animal Virus Research Institute, would be set up. At IVRI, new divisions of epidemiology, veterinary public health, experimental medicine and surgery and livestock products technology are proposed to be set up. The work of these divisions will comprise investigations on the epidemiology of various important diseases and their control measures, study of safety, efficacy, viability and applicability of newly developed medicines under control conditions and systematic research to evolve better techniques of collection, processing, packaging and marketing of meat, meat-meal, bones, bone meal and animal casing.

Since consumption of animal products has been steadily rising, various types of microbial food poisoning are likely to present problems. The two main aspects of research proposed concern the diseases communicable from animal to man and *vice versa* and the problem of rendering animal products safe for human consumption. For the control of foot and mouth disease, a vaccine has already been developed. Further research on this disease will be intensified for developing a potent vaccine for pigs. Under a co-ordinated project, typing of foot and mouth disease viruses would be undertaken. A number of co-ordinated multi-disciplinary research projects are proposed to be taken up for producing better productive strains of different species of livestock through adoption of scientific methods of breeding, feeding, management and disease control. At the Central Sheep and Wool Research Institute and at its two regional stations near Kulu and Kodaikanal, research will be undertaken on sheep breeding, management, health and wool processing technology.

**Dairying and Milk Supply :** Dairy development was given considerable emphasis from the beginning of the First Five Year Plan. The main problem related to supply of milk to large cities under hygienic conditions supported by schemes of procurement from rural areas. The progress during the First Plan was quite encouraging in the sense that the provision of Rs. 7.81 crores made in the Plan was more or less fully utilized.

In the Second Plan, stress was laid on establishment of colonies of milch cattle in metropolitan cities on the Aarey pattern. The policy in the Third Plan was to develop dairy projects with emphasis on milk production in rural areas linked with plants for marketing

surplus milk in urban areas. It was envisaged that the supply and collection of milk would be undertaken by producers' co-operatives in rural areas and the processing and distribution of milk and manufacture of milk products would be organized through plants operated as far as possible on co-operative lines. During the period 1961-69, 22 liquid milk plants and 4 milk product factories had been commissioned and brought in operation.

On the eve of the Fourth Plan, the total number of dairy plants in operation was 91, comprising 47 liquid milk plants, 7 milk product factories and 37 pilot milk schemes. Of these, 53 plants are in the public sector, while the rest in the co-operative sector. Most of them are operating at a loss on account of various reasons. In some cases, there was undue time-lag between the initiation and the commissioning of the project due to unavoidable circumstances and this added to the capital cost. Many plants have taken a long time to develop the operation to their full installed capacity. While some efforts to introduce balancing plants have been made, the inherent problem of fluctuation in milk supply between the flush and the lean season continues.

The programme has made further advance during 1970-71. The average output of milk of all the plants increased to 22.50 lakh litres a day as against 20.00 lakh litres in the preceding year, representing an increase of about 12.5 per cent. Seven liquid milk plants at Vishakhapatnam (Andhra Pradesh), Ranchi (Bihar), Kottayam (Kerala), Gwalior (Madhya Pradesh), Gulbarga (Karnataka), Mathura and Gorakhpur (Uttar Pradesh) were commissioned during the year. Besides, 9 small units started functioning at Burhanpur, Bilaspur, Khandwa, Katni, Raipur, Ratlam, Rewa, Sagar and Ujjain in Madhya Pradesh. Two large sized milk product factories were commissioned at Moradabad (Uttar Pradesh) and Jind (Haryana), the former with the assistance under the Third Line Danish Credit and the latter under the Yugoslav Credit. The total number of dairy plants in operation increased to 106 units, comprising 60 liquid milk plants, 7 milk product factories, 3 creameries and 36 pilot milk schemes as against 96 units comprising 53 liquid milk plants, 5 milk product factories, 3 creameries and 35 pilot milk schemes.

In the preceding year, in addition, 28 dairy projects, including development of pilot milk schemes into full-fledged units, were in various stages of implementation.

Most of the large sized dairy plants, including the Anand-Mehsana dairy complex in the co-operative sector and the Hyderabad-Vijaywada dairy complex in the public sector have shown substantial improvement in the procurement of milk over the earlier years. The plants at Ahmadabad, Agra, Aligarh, Baroda, Calicut, Chandigarh,

Delhi, Hyderabad, Kanya Kumari, Mehsana, Trivandrum and Vijayawada exceeded their installed capacities in respect of output. The overall increase in the procurement of milk could be attributed primarily to the adoption of better procurement and pricing policies by the project authorities.

In the field of milk products manufacture, there has been appreciable improvement. The country is now self-sufficient in these products, except milk powder which has to be imported to offset the seasonal shortfall in the milk production and to maintain the level of milk distribution to the consuming public in the major cities/towns. The milk product plants at Anand, Mehsana, Amritsar, Jind, Moradabad, Rajkot and Vijayawada increased their output to the level of about 45 tonnes of milk powder (including infant milk food) per day as against 40 tonnes per day manufactured in the preceding year. Of the milk products, the quantity of table butter and ghee manufactured was around 35 tonnes per day as against 30 tonnes in the previous year. There was good progress in the establishment of a composite milk plant at Barauni (Bihar) for which the equipment has been procured under the Swedish Credit Programme. Civil works of the project are in progress. At the Miraj composite milk plant, the erection of works have been taken up for the completion of the second phase of the project aimed at manufacturing milk products.

In the field of dairy equipment manufacture, the country has become almost self-sufficient. All equipment, except certain items of higher capacity and a few specialized and sophisticated items, required for the establishment of dairy plants, are now being manufactured in the country. This has enabled the country to save considerable foreign exchange.

**Objectives and Outlays :** As some of the existing dairy projects are operating at a loss, one of the principal tasks in the Fourth Plan is to take corrective measures. This will include changes in the milk pricing policy and introduction of modern management practices. The desirability of changing the management of public sector projects from departmental to corporate form will have to be pursued. It will also be necessary to establish a direct link between the small producers and the public sector milk plants through co-operative organizations. Dairy projects will need to be encouraged to take up extension work under their own auspices. At present, a number of dairy projects balance their operations by using imported milk powder. A phased programme is intended to be drawn up to increase production in the milk-shed areas and gradually eliminate dependence on imported milk powder.

The organized sector of the dairy industry will be extended to

smaller towns with emphasis on milk production in the rural areas. Measures will be taken to ensure that dairy projects are economically viable and, as far as possible, organized in the co-operative sector.

The financing of dairy development will be based on three principal sources, namely, Plan outlays, institutional finance and counter-part funds generated by the sale of commodity gifts under the World Food Programme. As far as institutional sources are concerned, the Agricultural Refinance Corporation has already entered the field and financed one dairy project. Further suitable schemes will have to be formulated for financing by the ARC. Briefly, it is expected that funds of the order of nearly Rs. 95.40 crores will be generated and will form part of the Plan outlays. On this basis, the total outlay under the Plan will be of the order of Rs. 138.97 crores.

In the Fourth Plan, first priority will be the completion of the 33 dairy schemes which spill over from the earlier period. In addition, organized dairy industry will be extended by taking up 24 new schemes in towns with a population of about 50,000. Furthermore, four milk product factories are proposed to be established. In addition, 64 rural dairy centres will be organized in areas with a population of less than 50,000 with a view to providing chilling and marketing facilities in isolated pockets of milk production.

**Project for Milk Marketing and Dairy Development :** With the co-operation of the World Food Programme (WFP) the Ministry of Agriculture has formulated a project for stimulating milk marketing and dairy development in India. Under this project, the WFP will supply, free of cost, during the five-year period from 1970-71 to 1974-75, 126 thousand tonnes of skimmed milk powder and 42 thousand tonnes of butter oil, worth Rs. 41.90 crores at international prices. After recombination of the skimmed milk powder and butter oil into liquid milk at the public sector dairies at Bombay, Calcutta, Delhi and Madras, the milk will be sold and the sale proceeds estimated at Rs. 95.40 crores will be used for increasing milk processing facilities of the public sector dairies from one million litres at present to 2.75 million litres per day at the end of the five-year project period. The generated funds will also be used for increasing milk production and procurement in the ten neighbouring States and the Union Territory of Delhi. This will be achieved by the provision of technical inputs which will include production of ready mixed concentrates and green fodder, artificial insemination, veterinary services and medicines, calf rearing assistance, development of improved milch animals and organization of rural procurement of milk. The project will also provide for the resettlement of the city kept cattle and buffaloes in the adjacent rural areas.

For the implementation of this project, Government have set up an Indian Dairy Corporation with headquarters at Baroda. Upto the end of April 1971, the World Food Programme has supplied 9,299 tonnes of skimmed milk powder and 3,100 tonnes of butter oil against 10,500 tonnes of skimmed milk powder and 3,500 tonnes of butter oil expected from them during the period July 1970 to June 1971. Funds to the extent of Rs. 3.72 crores have been generated upto end of April 1971 against the anticipated investment of Rs. 7.81 crores during July 1970 to June 1971 (the first year of the Project). In order to meet the requirements of the first phase expansion programme of the public sector milk plants, estimated to cost Rs. 1.91 crores, the Indian Dairy Corporation has placed or are placing indents amounting to Rs. 1.8 crores, on UNICEF for the import of dairy processing equipment and components. Deliveries are expected to begin in June-July 1971. The balance of the amount is being made available from free foreign resources. The requirements of plant and machinery for the second phase estimated to cost Rs. 25.26 crores have been discussed with the indigenous manufacturers and D.G.T.D. and items of the value of Rs. 13.96 crores will be imported. A stockpile of scarce indigenous iron and steel material is being collected to facilitate indigenous production of the remaining dairy processing equipment of the value of Rs. 11.30 crores. State-wise and area-wise break-up of Rs. 95.40 crores expected to be generated from the sale of WFP commodities, have been worked out and communicated by the Corporation to the respective State Governments. They have been asked to formulate concrete projects within these allocations.

#### XVI. Fisheries

With a coastline of about 4.8 thousand kilometers and a continental shelf of more than 2.6 lakh square kilometers, India has a rich potential for a thriving fishing industry. There is hardly any month during which fishing activity has to be stopped altogether; fish of some type or the other is available during most parts of the year. India has also long stretches of inland watercourses in which fresh water fish breed.

With these vast aquatic resources, actual production of fish in the country is rather meagre. Although the industry provides employment for over a million persons, the total production of fish in the country from marine and inland fisheries was only 1,075 and 671 thousand tonnes respectively during 1970. India ranks tenth among the world's fish producing countries.

One of the major reasons for the tardy development of the fishery industry in India till recently was the lack of adequate market

demand. Nearly one-third of the total population does not habitually eat fish; fish eating is a religious taboo to them. The other two-thirds of the total population eats less fish, mainly due to low income. Per capita fish consumption amounted to only 3.5 kg. per year for the fish eating population. For the entire population, it averaged to 2.3 kg. per year. Even this small figure of Indian consumption is very unevenly distributed in the country. West Bengal, the leading consumer, takes 2.9 kg. per head while Punjab consumes only 0.4 kg. and Bihar less than 1 kg.

In most of the advanced countries, the level of fish consumption per capita per year is much higher. In U.K. it is 18 kg., in Denmark 10.5 kg., in Germany and France about 8 kg., in U.S.A. 7 kg. and in Italy and Switzerland 5 kg. and 3 kg. respectively. Even a small country like Sri Lanka—our southern neighbour—consumes as much as 16.4 kg. of fish per capita. Thus, increase in demand upto even a modest level of consumption would require a substantial increase in fish production.

It is estimated that of the animal food consumed by man, fish forms about 3 per cent of the total in the world though the percentage in some areas like Ireland, Newfoundland, parts of Norway, and Japan is comparatively much higher.

Poor techniques of production and negligence by the State for a long time accounted for low production. The continental shelf extend over 100 fathoms on the 4,300 kilometres of coast giving 2.9 lakhs square km. However, because of elementary and crude implements and small and primitive boats of canoe types used for fishing, only a small portion of the large continental shelf has, as yet, been exploited. Of the innumerable estuarine sources, perennial rivers, irrigation works and confined waters of tanks, ponds, etc., very few are used for pisciculture due to customs of the people and a low social status, of the fishing occupation. Mostly, illiterate people equipped with traditional skill are engaged in fishing. Besides, there are only a few good harbours. Also there is hardly any facility for refrigeration, and curing yards have been established only recently. This makes transportation difficult and marketing expensive.

Fishing is under the administrative jurisdiction of the State Governments. Till 1958, the Fishing Department was part of the Revenue Department and as such it paid scant attention to the development of fishing. The State Government was not willing to spend and invest in development of fishing out of its other revenues. Deep sea fishing has been recently taken up with the mechanization of some of the boats.

**Production of Fish :** Our land and sea resources yield, at present, only a fraction of what they could if exploited on modern lines.

Although as many as 1,500 kinds of fish are known to exist in India, only a few types are caught in appreciable quantities, and so far we have not been able to tap more than 5 to 6 per cent of our entire fishable marine area. In the past, nearly one-third of the total catch was wasted due to the shortage of ice, necessary for preserving fish. From the year 1950, statistics on the catch of marine fisheries have been developed by the Central Marine Fisheries Research Station, Mandapam. It has now a network of selected observation centres spread on the East and West Coast of India which form the main sources of marine fish supply.

Important sea fishing areas are confined to the coastal waters extending from 8 to 16 kilometres from the shore of Gujarat, Kanara, Malabar Coast, Tamil Nadu, Coromandal Coast, and the Gulf of Mannar. Of all these, Tamil Nadu with the best organized fisheries department holds a highly creditable record. Its 2,800 kilometres coastline is surrounded by over 1 lakh square kilometres of shallow sea water. The Tamil Nadu Government was the first to take interest in the industry about three decades back. A wide range of activities connected with this industry from the manufacture of 'Fish Guano' manure to pearl buttons and bangles are seen in the State.

Of the total production of marine fish, as much as 35 per cent is produced in Kerala alone and adding three other important South Indian States—Andhra Pradesh, Tamil Nadu and Karnataka, nearly two-third of total production comes from this region. Another 30 per cent is produced in the western region of Gujarat, Maharashtra, Goa and Laccadive Islands. The only other State which is of some significance in the east is West Bengal which during 1970 produced over 31 million tonnes of marine fish. As regards inland fish, here again the southern States of Andhra Pradesh, Tamil Nadu, Karnataka and Kerala put together account for nearly one-half of the total production. The share of Maharashtra and Gujarat in the west is quite negligible but the eastern State of West Bengal and Uttar Pradesh in the north contribute substantially to this total production.

The bulk of marine fish production comes from the inshore areas in which non-powered as well as small powered craft operate. The strategy of development has been to intensify the fishing effort with powered craft in this sector while developing the infra-structure for fishing in off-shore and deep sea areas. About 730 mechanized boats were programmed for introduction in the various maritime States during the year 1970-71 to add to the fleet of 8,230 powered boats already in operation. Integrated projects covering boat building, fishing and marketing have been formulated in several maritime States. To assist the development of mechanized fishing, harbour facilities are being provided at several points round the coast. For

the development of deep sea fishing efforts have been intensified on location and charting of fishing grounds, provision of larger harbours and training of personnel. Measures have also been taken to ensure availability of deep sea fishing vessels through indigenous construction as well as by limited imports. In addition to larger harbours designed to handle deep sea fishing as well as mechanized boats, harbour facilities estimated to cost nearly Rs. 46 lakhs are being provided at 40 sites spread over several States.

**Fishing Harbours :** The work of construction of deep sea fishing harbour at Sasoon Docks, Bombay, estimated to cost Rs. 4.74 crores commenced during the year 1970. Work is now continuing on the construction of deep sea fishing harbours at Tuticorin in Tamil Nadu, Vishinjam in Kerala and Karwar in Karnataka, which are estimated to cost Rs. 208 lakhs, Rs. 173 lakhs and 24.86 lakhs respectively. A fishing harbour at Port Blair, at an estimated cost of Rs 50 lakhs, which will handle deep sea fishing vessels and mechanized boats, has been sanctioned during the year. The construction of a harbour costing about Rs. 151 lakhs which will provide facilities for 15 large deep sea fishing vessels at Roychowk on the Hooghly has also been approved. A project report for a large deep sea fishing harbour at Cochin has been prepared and plans and estimates are under preparation for fishing harbours at other major ports. The UNDP Fishing harbour pre-investment survey project is continuing investigations of suitable harbour sites and preparation of designs and estimates. The project has conducted reconnaissance surveys of 16 sites in Andhra Pradesh, 6 sites in Karnataka, 5 sites in Maharashtra, 5 sites in Kerala and 7 sites in Orissa. The project completed economic studies and detailed engineering surveys and soil mechanics investigations at Malpe, Honavar, Ratnagiri, Kakinada, Nizampatnam and Narsapur. Plans and estimates were drawn up by the project for the first three harbours.

**Fishing Vessels :** Orders were placed by the Government of India and State Governments between August 1968 and February 1969 with the Indian Ship Building Yards for construction of 40 deep sea fishing vessels of 17.5 meters overall length. In order to encourage the use of indigenously constructed vessels, a scheme has been introduced under which indigenously constructed steel deep sea fishing vessels will be subsidized upto a limit of 27.5 per cent of the c.i.f. cost of an equivalent imported vessel. During the year, a few orders were placed by the fishing industry on foreign yards for the deep sea fishing vessels under a scheme of limited import. The fisheries industry will receive a big boost when India's first fibreglass reinforced plastic boat fabricating factory is commissioned in Mangalore.

**Indo-Norwegian Project :** According the Indo-Norwegian Project entered between the Governments of Norway and India, the Norwegian team provides expert assistance in various fields of fishery technology, engineering, navigation and fish processing and counterpart technical personnel were trained under their guidance. The activities under the project include deep sea exploratory fishing, demonstration of modern technology with special reference to processing and marketing and training of personnel. Encouraged by the results of the deep sea trawling operations carried out on the South-West Coast, exploratory trawling for deep sea prawn and lobster was extended to the East Coast. The surveys indicated occurrence of the same species of deep sea lobster already located on the West Coast, in appreciable quantities at several places in the Gulf of Mannar along the 125 fathom belt. Several species of deep sea shrimps were also located along the 150 to 200 fathom zone. Thus, a fishery for deep sea lobster and shrimp has become available for commercial exploitation along the South-West as well as the South-East Coast. Purse-seining operations were initiated during the year in the Laccadive Sea and it is proposed to carry out further operations with the help of a new vessel to be acquired shortly with Norwegian aid. Sanction has been issued for staff and equipment for two modern fish stalls at Coimbatore and Bangalore under a scheme designed to demonstrate and promote internal marketing of marine fish under hygienic conditions.

**Preservation and Transport:** For proper preservation and quick transport of fish from landing areas to interior markets, one ice plant, two cold storages, one freezing plant and one frozen storage were commissioned under State programmes. In addition, work was in progress under these programmes for erection of 28 ice plants, 24 cold storages, 7 freezing plants and 8 frozen storages. Besides this 3 refrigerated rail vans for transport of fish are under construction.

**Types of Fish :** For a vast country like India, physical and biological conditions under which fisheries exist are varied. This gives a large variety of fish. They have local popular names. Matching of these names with their English equivalents is not possible in all cases. The first comprehensive and systematic classification of fishes on an all-India scale was made in 1876—1889. Subsequently, some of the State Departments attempted to rename some varieties. However, Day's classification is still common and is widely accepted.

There are 14 major groups of commercial fishes with several types included in each of them. These groups are (i) Elasmobranchs which included sharks, saw fish, skates and rays (ii) Eels (both marine and

fresh water), (iii) Cat-fishes (marine and fresh water), (iv) Bombay-duck, (v) Feather backs, (vi) Mackerels and the Perches, (vii) Silver Bellies (viii) Pomfrets, (ix) Elat fish, (x) Mulletts, (xi) Indian Salmon, (xii) Jew fishes, (xiii) Live fishes other than Cat-fishes, and (xiv) Carps. Of these, Carps and Live-fishes other than Cat-fishes are found in rivers, tanks, etc. all over India. Indian Salmons (Limn especially) are found in Saurashtra, Mulletts only in large rivers, Pompsrets in gulf of Cambay, and in certain areas of Coromondal Coast, Feather-backs in fresh and brackish water, and Bombay-duck off Bombay coast. Sharks, Herrings and Skates are found mostly in the Bay of Bengal, and Marine Eels again on Bombay coast. Mackerels are mostly available in Madras and Kerala coastal areas and Silver-bellies on South-West coast of India. Prawns are found over wider areas of Kerala, Kutch, Bombay and Bengal, but lobsters in the same group (of Carps) are found in West Bengal areas.

In the various types of marine fish, quantitatively, the major share was contributed by (i) Mackerels and Perches, (ii) Crustaceans, (iii) Herrings and Anchovies, (iv) Bombay-duck, and (v) Jew fish. During 1950—59, the production of Bombay duck increased several fold and that of prawns, shrimps and other crustacean and Cat-fish nearly doubled after the Second Plan. Production of the more popular but quantitatively less important varieties like Pomfrets has registered substantial increases. The data regarding the output of various types of fresh water fishes are not available.

**Disposition of Catch :** Data on the disposition of nominal catch in India are available over the years. This gives some idea of the quantities marketed fresh, cured, canned, used for miscellaneous purposes and offals for reduction, etc. Of the total production of 1,746 thousand tonnes during 1970 as such as 1,170.5 thousand tonnes was marketed fresh. Of the balance, total quantity cured was 354.3 thousand tonnes. Curing is done sun-dried or salted. During the year 1970, the quantity of sun-dried fish was 202.2 thousand tonnes and salted was 152.1 thousand tonnes. Besides the small quantities canned put for miscellaneous use, 95.8 thousand tonnes were used for reduction and 80.2 thousand tonnes for freezing.

Utilization of fish for food and other purposes varies from year to year. Popular prejudices against certain types of fish depend on appearance. Since shoaling conditions would vary every year, quality of produce also varies. In maritime States, fresh water fishes are consumed almost fresh but small quantities of marine fish are sun-dried. Fresh water fishes are sun-dried on a commercial scale in Assam and West Bengal. In coastal areas, sun-dried fish is consumed only during monsoon. Of fresh fish, sharks

are in good demand in Tamil Nadu and southern States, but poor demand in Bombay city.

On the whole, Pomfrets, seer fish, Mulletts and Indian Salmons are in good demand because of their clean appearance, firm flesh, small bones and good taste. A peculiarity about Indian demand is that those used to fresh water fish do not eat sea fish and *vice versa*. In India, fish is eaten as fish curry with rice and *chappatis* or is fried in fat (ghee or oil) along with other vegetables. Sardines, mackerels, seer fishes, eel fishes, Pomfrets, sharks, prawns, etc., are salted. Mackerels and seer fish are pickled.

**Imports and Exports :** Imports of fish have fallen in recent years to a negligible figure of 29 tonnes during 1969-70. They were actually only 4 tonnes during 1966-67 as against 31.5 thousand tonnes during 1962-63. Small quantities being imported now consist of fish products and fish preparations in containers. Even earlier, imports of this type were not very large. The major type of fish imported earlier was fresh, chilled or frozen type as well as salted, dried or smoked.

Fish and fish products are making a significant contribution to our foreign exchange earnings. But even now India's share of the world trade in marine products is barely 2 per cent. In view of the growing world demand on the one hand and the large potential available in India for augmenting supplies on the other, the scope for increased exports of fishery products from India appears to be immense. In the last few years, there has been a steady increase in the export earnings from fish and fish products. India exported 15.5 thousand tonnes of fish and fish products valued at Rs. 3.91 crores in 1961-62. The exports went up to 29.5 thousand tonnes with a foreign exchange earning of Rs. 30.83 crores in 1969-70, the highest record so far (Table XXXVIII).

Ninety per cent of the country's exports consist of fresh, chilled, frozen and canned fish and the principal export varieties are prawn, shrimp, frog legs and lobsters. In 1968-69, export of prawn and shrimp fetched Rs. 19.70 crores out of the total foreign exchange earnings of Rs. 22.17 crores from fish and fish products. The U.S.A. and Japan have emerged as the biggest importers of Indian prawn and shrimp over the last few years. France and Belgium are the two other potential markets. There is an increasing demand for shrimp in the U.S.A., Japan and Europe and India can hope to benefit by it only if she is able to meet the product requirements.

The demand for prawn in Japan is to be increasing at a rate of 17 to 18 per cent per annum and Japan is, therefore, keen on developing new sources of supply. India is a very promising source of supply as she is close to Japan after Thailand. The Japanese market for

prawn is more sophisticated than that of the U.S.A. and only large sized prawns are imported by that country. Six new companies are now setting up prawn processing plants at Visakhapatnam. This is expected to give a big boost to their exports to Japan so as to reach the Fourth Plan target of Rs. 40 crores worth of fishery exports.

In recent years, India has emerged as one of the leading suppliers of frozen frog legs and lobster tails in the world market. In 1961-62, there was hardly any export of these items. In 1968-69, India exported frozen frog legs valued at Rs. 57 lakhs and lobster tails valued at Rs. 84 lakhs. The exports are made mainly to the U.S.A., France, Belgium, Netherlands and West Germany. There is a keen demand and the export of this item can be increased substantially if the supplies to the processing factories are stepped up. Frogs are available in swampy and low lying areas in Kerala, Tamil Nadu, Karnataka, Maharashtra and Andhra Pradesh. They are caught at night with the aid of bright petromax lanterns and delivered in the morning to the processing factories where they are butchered and quickly frozen for export. Only the pair of hind legs of the frogs are used for freezing and are graded according to the size and colour.

Lobster is another highly favoured item of sea food in foreign countries, particularly in the U.S.A. which is the biggest market. The increased demand from abroad for Indian lobsters has given a fillip to this hitherto less exploited fishery. Each kilogram of lobsters fetches Rs. 9 to Rs. 11 in India and when marketed overseas as frozen tail, gets Rs. 31 to Rs. 33. While the industry started with a modest export earning of Rs. 2 lakhs or so in 1962, the export earnings went up to Rs. 12 lakhs in 1965-66 to Rs. 22 lakhs in 1966-67 and Rs. 36 lakhs in 1967-68. The foreign exchange earnings from this source shot up to Rs. 84 lakhs in 1968-69.

**Progress under the Plans :** Under the Five-Year Plans important programmes relating to exploitation of new fishing grounds, mechanization of fishing boats, improvement of craft and gear, training of fisheries officers and fisheries operators, improvement in landing and berthing facilities, refrigerated transport and fishing requisites, and organizing of processing and canning were undertaken. Investigations were also made at the Central Fisheries Technological Research Institute at Cochin with a view to improving designs of fishing crafts and fishing gear. In addition to the sea fishing station at Bombay, five similar stations were established for operating modern fishing grounds, determining fishing seasons and training of personnel. Two of these stations have, however, been closed temporarily. Two training institutions, one for officers and the other for co-operatives, were set up at Bombay and Ernakulum

respectively. A number of boat-building yards have been established under the coastal States.

About three thousand boats were mechanized during the first three Five-Year Plans and ten fishing harbours were taken up for development. The development of fishing harbours at minor ports was also taken up as Centrally sponsored scheme under the special programme during the last years of the Third Plan. Nine refrigerated rail vans were introduced on an experimental basis for the transport of fresh fish from producing centres along the coast to places like Calcutta and Delhi. The possibilities of manufacturing refrigerated and insulated trucks for the transport of frozen and fresh fish within the country are being explored. Proposals for manufacturing of marine diesel engines within the country with foreign collaboration are also under consideration. Efforts are being made to import the minimum number of built-in trucks initially, but later on only refrigeration units will be imported and the State Governments will be asked to build the boats and fit on to Indian chassis.

For the development of inland fishing, considerable progress has been made by raising fish seed production by artificial means and locating additional centres through natural resources. Attention is also being given to the development of reservoir for fishing, stocking, and culture of fish. As a result of these measures, the total production of fish (inland and marine) is estimated to have been increased to about 17.46 lakh tonnes by the end of 1970 as compared to 9.52 lakh tonnes in 1951. The total fish potential of India as against this has been estimated over 10 million tonnes both marine and inland.

Fish being an important export item, efforts are also being made to increase the production of those species which have a big foreign demand. The Ministry of Foreign Trade has fixed an export target of Rs. 48 crores for the Fourth Five Year Plan against Rs. 18 crores during 1967-68. To achieve the production targets under the Plan, an outlay of Rs. 83.57 crores has been fixed.

With regard to marine fisheries, it is important to note that nearly three-fourth of the country's total catch comes from the West Coast which abounds in prawns, sardines, Bombay duck, Mackerel, etc. It has been estimated that the annual catch amounts to about 800 kg. per fisherman and 8,000 kg. per boat engaged in the industry. Efforts are now being directed towards organizing supplies of fisheries requisites through fishermen's co-operative societies and the introduction of mechanized vessels on a large scale.

The Central Institute of Fisheries Education, Bombay, established in 1961 with the object of training fishery officers at the district level, had so far trained 183 candidates. The institute is now regarded as

the highest educational institute in fisheries in the country and meets to some extent the needs for similar training from neighbouring countries. The inland fisheries training course at Barrackpore and inland fishery co-operative training courses at the Regional Training Centres at Agra and Hyderabad provide training to fishery officers at intermediate and operative levels respectively. Thirty-nine candidates at the Barrackpore unit and seventy-seven candidates at the Regional Training Centres at Agra and Hyderabad were admitted for the courses commencing in 1970.

The Central Institute of Fisheries Operatives at Cochin and Madras provide the training programmes for fishing second-hands, engine drivers, boat-building foremen, shore mechanics and radio-telephone operators.

### XVII. Forest Resources

Forests are an important resource of a country. They help to maintain hydraulic cycle through their moderating influence on climate and by attracting rain clouds. They prevent soil erosion by controlling the fury of floods and breaking wind speeds. They help to bind the soil by their foliage. They can be used as a belt to prevent the march of deserts.

In India, the two evils of unplanned land use and soil erosion have caused great damage. Of this, the most devastating effects are seen on the friable soils of Hoshiarpur and Kangra Siwaliks, in Punjab. It is said that when Emperor Jahangir built the castle of Nurpur for Nur Jahan, in the 17th century, the forest was so thick that a bird could hardly spread its wings. Today, it is a denuded hilly area with nothing more than tufts of grass and thorny bushes. This destruction took place in less than 300 years.

Dense forests, which covered the outer Himalayas, have also been reduced to negligible proportions. The same has happened in the Etawah and Agra regions of Uttar Pradesh, Chhota Nagpur, plateau in Bihar and the Nilgiris in the south. There is evidence to the effect that the area around Mathura (Uttar Pradesh) was having regular forests during the Mahabharata age. The destruction of these forests later has enabled the Rajas'han desert to encroach upon South-West Uttar Pradesh, creating a serious problem.

India is still rich in forest wealth. Forest products are varied. Firewood obtained from the forests is the main fuel used in the country because gas and electricity are of little importance as domestic fuel. The farmer uses wood for the manufacture of his agricultural implements and in making houses. His cattle graze in

the forest. Cattle deriving their subsistence by grazing in the forests number as much as 30 to 35 millions.

Forests supply timber for buildings and wood for furniture. Wood is also used for railway sleepers and for the manufacture of railway coaches, bus and truck bodies and many other articles of every-day use.

A large number of industries depend upon the products of forests. Bamboo, lac, gum, rosin, tanning materials, medicinal herbs and *kattha* (catechu) are forest products. Match industry, paper pulp including viscose pulp, plywood, sandal wood oil industry, turpentine oil industry, etc., depend solely upon the raw materials obtained from forests. All this provides employment for a large number of people in a variety of jobs, e.g., wood cutting, sawing, carting and as carriers, craftsmen, carpenters, etc., working in and near the forests in addition to people engaged in industries utilizing raw products of the forests.

In so far as employment is concerned, forestry activities are, by and large, labour intensive. What is more, these activities are practised in such areas where opportunities of employment from other industries are very few.

In India, because of the low per capita income level, the demand for forest products has remained restricted. In contrast, the demand for field crops has been persistently high and has tended to increase rapidly with the growth in population. Field crops, thus compete with forest products for land use. Land under crops expanded rather rapidly during the last three or four decades, resulting in the depletion of forest areas. The relatively low demand for forest products for a long time led to the neglect of forests both by the State and private owners. In some regions, depletion of forest areas and the neglect of forests have disturbed nature's hydraulic cycle, leading to the spread of desert or semi-desert conditions. During the last one and half decade, demand for forest products has been increasing with the expansion of the rayon, paper and match industries. With the expansion of irrigation, afforestation of catchment areas has become a necessity. Marching deserts from the west have also emphasized the need for expansion of forest areas. Government is now seriously engaged in expanding forests and developing forest resources. Sizeable financial allocations have been made in the developmental plans for this purpose.

**Forest Area :** In India, nearly 50 per cent of the total land area forms the watersheds of 187 river valley projects expected to be completed by 1973-74. Forests in these watersheds will be an important factor in prolonging the usefulness of the projects. Moreover, forests are the main basis of the country's industrial development.

With various uses of forests, it is difficult to establish a set criterion to determine the minimum area necessary under forest in each of the State. For maintaining the hydraulic cycle, it has been suggested that there should be a minimum of 20 per cent of the area under forests. The highly uneven distribution of forest area in different regions leads to extreme variations in climate and rainfall. The total area under broad-leaved forests taken together was 7,07,000 sq. kilometres during 1964-65. The total area under forest in India during 1964-65 was 753,000 sq. kilometres constituting roughly 23.0 per cent of total geographical area in the country. The distribution of the forest area as between different States has been rather uneven. While Madhya Pradesh accounts for as much as 172 thousand sq. kilometres (22.8 per cent), Orissa 68,200 sq. kilometres, (9.1 per cent), Maharashtra 67,100 sq. kilometres (8.9 per cent), Andhra Pradesh 64,500 sq. kilometres (8.6 per cent), a State like Punjab had only 17,900 sq. kilometres (2.4 per cent) of the area under forests (Appendix). About 62 per cent of the forest area in the country is concentrated in seven States—Assam, Madhya Pradesh, Uttar Pradesh, Bihar, Andhra Pradesh, Maharashtra and Gujarat.

Area under forests as a percentage of the total land was low in Punjab, Rajasthan, Uttar Pradesh, West Bengal, and Jammu and Kashmir. In States, such as Bihar, Karnataka, Assam, Andhra Pradesh, Kerala, Madhya Pradesh and Orissa, the proportion of forest area to total land was near or above the minimum as indicated above. In Himachal Pradesh, Madhya Pradesh, Orissa, Tripura and Andman and Nicobar Islands, forests formed over 35 per cent of the total land area, the proportion being more than 60 per cent in the last two regions. Total forest area in each of the State has been classified according to :

1. Type of forests—merchantable and unprofitable or inaccessible.
2. Legal status—reserved, protected and unclassed.
3. Composition—coniferous, sal, teak and miscellaneous.
4. Ownership—Forest Department, civil authorities, corporate bodies and private individuals.

Of the total forest area, as much as 590,000 sq. kilometres (78.3 per cent) is merchantable. Unprofitable or inaccessible forests are mainly located in Maharashtra (28,800 sq. kilometres), Madhya Pradesh (27.5 thousand sq. kilometres), Uttar Pradesh (14,900 sq. kilometres), Punjab (10,900 sq. kilometres) and Jammu and Kashmir (11,900 sq. kilometres).

Most of the forests in India are broad-leaved or non-coniferous in composition. On the hilly part of the country generally coniferous forests grow.

**Forest Management :** Most of the forest areas are State-managed. In the year 1949-50, the State managed about 77.2 per cent of the total forest area, the remaining 22.8 per cent being owned or managed by corporate bodies or individual owners, the former accounting for 0.3 per cent and the latter for 22.5 per cent of the total forest areas. In 1957-58, the State's share increased to 96.9 per cent subsequent to abolition of intermediate tenures of land and the shares of corporate bodies and individuals declined to 0.1 and 3 per cent respectively. With the nationalization of private forests in Kerala in March 1971, more than 3,000 sq. kilometres of area has come under State control. Kerala forests, which occupy some 27 per cent of the geographical area, are the greatest assets of the State.

Most of the State-owned forests are managed by the Chief Conservator of forests who is responsible for the administration and management of forests. He is assisted by a cadre of trained forest officers. They prepare working plans and conduct silviculture experiments. State Forest Departments seek the advice of the Inspector of Forests, who is attached to the Ministry of Agriculture, Government of India.

Small patches of woodlands scattered over villages and located within village boundaries are managed by Revenue Administration. There is no systematic management or exploitation of these village woodlands. They produce fuel wood and grow *babul* trees covered by small shrubs.

The forest areas managed by Chief Forest Conservator are properly preserved. For this purpose, forests are classified as reserved or protected and the rest are non-classified. Reserved and protected forests are reserved permanently as forests either for production of timber and other forests produce or for other protective purposes, such as prevention of soil erosion, flood, halting deserts, etc. Unclassed forests are not exploitable. These include forest areas which either cannot be worked due to unfavourable physical conditions or have been permanently destroyed but have not yet been put to any other use. The area under reserved and protective forests has continuously increased since 1949-50, consequent upon the acquisition of private forests by the State after abolition of the intermediary land tenures. The Government extended their conservation policy to these areas. Of the total forest area of 763 thousand sq. kilometres, during 1964-65, reserved area was 327.2 thousand sq. kilometres (43.5 per cent) and another 226.0 thousand sq. kilometres (29.9 per cent) as protected.

Felling of old and ripe or useless trees at regular intervals, reforestation of these areas and afforestation of under-stocked or badly stocked areas or of new areas brought under forests are the main constituents of efficient forest management.

**Forest Products :** Forests in India contribute hardly 0.6 to 0.8 per cent towards the national income. The per capita forest area is 1.8 and 3.5 hectares in the U.S.A. and U.S.S.R. respectively, as against 0.2 hectare in India. The per capita consumption of round-wood in India works out to hardly 0.42 cubic metre, compared with 1.64 cubic metres in the U.S.A. The consumption of pulp products is hardly 0.7 kg. as against over the 34 kg. in U.K.

TABLE XXXIX  
Annual value of Imports and Exports of all Commodities  
vis-vis Forest Products (1961-62 to 1969-70)  
(Rs. in million)

| 1967-68 | 19,743               | 323                | 1.6                                    | 11,928               | 200                | 1.7                                    |
| 1968-69 | 18,616               | 327                | 1.7                                    | 13,563               | 258                | 1.9                                    |
| 1969-70 | 15,675               | 390                | 2.5                                    | 14,086               | 276                | 2.0                                    |

The Indian Timber Trend Study based on the 1953-55 situation concluded that, 'The per capita requirement of round-wood is expected to go up by 18 per cent from 1953-55 to 1975, but meanwhile the supply tends to dwindle down by 23 per cent'. This is a big challenge which the Indian forests have to accept. As our supplies of wood fall short of demand, on a rough estimate, 250 million tonnes cowdung is burnt annually as fuel. This is colossal waste and has got to be stopped. There is a heavy demand for special qualities and types of Indian wood in the world. In the

interest of economic development and foreign exchange earnings there is urgent need to increase timber production.

\*Includes timber, round-wood and pump and matchwood.

\*\*Includes firewood and charcoal wood, for the year 1966-67.

**Imports and Exports :** Exports and imports of forest products are quite negligible in the total foreign trade of the country. India imports mainly the major forest products like wood-lumber and cork, paper and paper waste, wood and cork manufacture, paper, paper-board and their manufacture. The main source of supply of teak wood is Burma while other types of wood are imported from U.S.A., Canada, U.K., Sweden and Finland. Paper and pulp products are imported mainly from Sweden, Norway, Australia and U.K. From among the major forest products, a large quantity of wood is also being exported which is primarily of the hard type such as sandal-wood and some derived products. Among derived products, paper and paper making materials are the important items.

Whereas imports consist predominantly of major products, exports are dominated by minor products. Exports of both major and minor products have gone up appreciably during the last few years and an aggressive export policy is being followed by the Government while every possible effort is also being made to cut on

imports. The object is that the present deficit in exports over imports should end as early as possible.

**Forest Labour and Employment :** Forests in India do not provide extensive employment. What is, however, important is that these activities are practised in such areas where opportunities of employment from other industries are very few. In 1949-50, on an average, 204.5 thousand persons per day were employed on a whole time basis, and 365 thousand per day on part time basis. Of the 204.5 thousand whole time employees 19.4 thousand were engaged in forest management, 129.4 thousand in forest extraction and 55.7 thousand in forest industries. About 75 per cent of the part time workers were employed in forest extraction. The number of these workers no doubt declined in subsequent years. It is, however, estimated that during 1970-71, forestry activities provided employment to about 3 million persons.

The tribal population living within or near forest areas is the major source for recruiting forest labour. The tribal population, the original settlers of the land, was driven to the forest by its sheer incapacity to adjust itself to the economic forces of a competitive economy. The tribal people forthrightness, loyalty, honesty and limited aspirations for material prosperity were exploited by unscrupulous and greedy persons. Those originally settled in forests enjoyed unrestricted rights to timber, for grazing cattle, fuel and for cultivation of land. Their rights were severely curtailed with the enunciation of the policy of conservation of forests. They could no longer practise zooming cultivation, and they did not possess the necessary skill for farming of cultivated lands. Forest lands are less fertile in most cases for growing crops. All these reasons led to dwindling incomes and increased poverty of the forest settlers. Forest labour then came to be a major opening to them to earn. Forest contractors often exploited the economic conditions of the tribal forest labour. The Scheduled Tribes Commission set up in April 1960, studied the economic conditions of tribals living in forest areas in nine important States. It observed that the special machinery to protect tribals against exploitation by outsiders had not worked satisfactorily. Lack of continuous employment and indebtedness were listed as two major problems. The commission recommended organization of forest labour co-operatives on the lines of those operating in scheduled areas of Maharashtra and Gujarat. The problem of indebtedness should receive immediate and more decisive attention. Regarding indebtedness, some ameliorative measures have been adopted in a few States. In Andhra Pradesh, for instance, the outstanding interest was discharged in January 1957. These measures are, however, not adequate.

**Forest Labourers' Co-operative Societies :** The idea of forming Forest Labourers' Co-operative Societies was first conceived for the Warli tribals of Thana district in the former Bombay State. This was subsequently developed into Forest Labourers' Co-operative Societies in 1945-46. Under this system, forest contracts, instead of being sold by auction are given on an agreed basis to the Forest Labour Co-operative. The forest labourers, besides earning wages as per the prescribed rates for different operations, also receive bonus and other facilities from the profits of the co-operative societies. The enthusiasm evinced by the tribals in working these societies can be seen from the spread of these societies over the large portion of the forest area in the former Bombay State.

A similar effort at prompting labourers' co-operatives was also made in Tamil Nadu. In 1950, the State Government appointed a team of experts to formulate plans for amelioration of the tribals and for the development of the Agency areas in the four districts of Srikakulam, Visakhapatnam, East Godavari and West Godavari. The team recommended a network of multi-purpose co-operative societies at different centres in the Agency areas with a view to eliminating exploitation by the money-lenders and traders. These societies would (i) purchase all the minor forest produce collected by the tribals, and would also buy marketable surplus of field crops, (ii) sell them their daily needs like kerosene oil, salt, spices, etc. and (iii) provide them easy credit facilities.

After the constitution of Andhra Pradesh, the State Government examined these suggestions, but it was found that the co-operative institutions functioning in the agency areas did not work satisfactorily among the tribals. The conclusion reached was that an institution under the control of the Government and catering to the needs of tribals was necessary. As a result, the Andhra Scheduled Tribes Co-operative Finance and Development Corporation was constituted on October 26, 1956, under the Madras Co-operative Societies Act, 1932 with its area of operation extending to the scheduled areas in the districts of Srikakulam, Visakhapatnam, East Godavari and West Godavari. The Corporation started functioning on April 5, 1957.

By end of June 1960, eight Primaries (Agency Produce Co-operative Marketing Societies) had been affiliated to the Corporation covering the entire tribal areas in Srikakulam and Visakhapatnam districts and parts of the tribal areas in the East Godavari district.

**Forest Labour Co-operatives :** In the National Forest Policy Resolution adopted by the Government of India in 1952, it was stated that no forest policy, however well-intentional and meticulously

drawn up, had the slightest chance of success without the willing support and co-operation of the people in the neighbourhood of the forests. It was stressed that intermediaries who exploited both the forest and the local labour for their own benefit might be supplanted gradually by forest labour co-operatives which might be formed to suit local conditions. Appreciable progress has since been made in the organization of such co-operatives particularly in Maharashtra and Gujarat. Their number now exceeds 1,200 and their work is valued at over Rs. 4.50 crores. In some States, public agencies such as Tribal Development Corporations have been set up with the object, among others, of promoting such co-operatives.

**Forestry in The Fourth Plan :** In forestry, there are three main objectives : increase productivity link up, forest development with various forest-based industries and to develop forests as a support to rural economy. As regards the first objective, it is necessary to stress that one of the problems of Indian forests is relatively low productivity. Forests occupy about 23 per cent of the land surface of the country and yet the contribution of forestry and logging in the net domestic product at current prices in 1967-68 was only 1.2 per cent. The average per hectare production per annum of forests in India is estimated at about 0.53 cubic metre as against the world average of 2 cubic metres. This is indicative of the size of the effort necessary in the coming years.

The immediate objective is to attain self-sufficiency in industrial and commercial timbers, in fuel wood and other forestry products required by consumers and the ancillary industries. This objective is proposed to be achieved (i) by increasing the area under man-made forests for the most efficient and economical utilization of space; (ii) by increasing productivity of existing forests through better logging techniques and tools; (iii) by improvement of communications so that hitherto untapped resources can be exploited; and (iv) by popularization of the use of secondary timber after proper seasoning and preservation treatment. Accordingly, activities under the various schemes, namely, (1) plantation of quick-growing species, (2) economic plantations for industrial and commercial uses, (3) rehabilitations of degraded forests, and (4) farm forestry-cum-fuel plantations, were intensified during the year. Development of communications was also accelerated to increase accessibility to the forests. As against 1.36 lakh hectares of man-made forests raised during 1969-70, 1.39 lakh hectares are likely to be planted with industrially important species during the year under review.

Emphasis is being laid during the Fourth Five Year Plan on measures to meet the immediate and long-term agricultural and

industrial requirements, since the demand for various forest products, timber, domestic fuel and raw materials for industries has rapidly increased. Consumption of industrial wood in 1968-69 is estimated at 11 million cubic metres, while the demand by 1973-74 is projected at 16 to 17 million cubic metres. It should be possible to increase the supply by 1973-74 to about 13.5 million cubic metres. To increase forest production, the Fourth Plan envisages further efforts at creating large scale plantations of valuable quick-growing species and species of economic and industrial importance. Intensive exploitation and rational utilization of existing forest resources will be aimed at. Concerted efforts at regenerating areas, where forest produce is removed for industrial uses will be taken. This is equally important for all forests where produce is to be utilized for new paper and other industrial projects. Steps will be taken to bridge the gap between demand and supply by fuller utilization of forest resources, other than wood, such as bamboos and grass-sized timber. The object is to achieve self-sufficiency in forest products as early as possible, specially for major forest-based industries such as pulp, paper, newsprint, wood panel products and matches so that the import of some of these items may be replaced and some sizeable exports of paper and wood panel products built up. In some States, there are inaccessible forests which have not yet been economically exploited. Communications will be provided in selected areas. In addition, in areas, which are already being exploited, improved methods of working, including reduction of wastage, will be introduced. The consolidation and scientific management of hitherto unorganized forests and protection against unregulated cutting, grazing and fire will be undertaken.

The basic principle of Government policy that minor forests, pastures and grazing grounds must be managed mainly in the interest of the population of the tract and particularly to serve their requirements of fuel and fodder, has long been recognized. However, efforts made in the past to achieve these aims have not proved successful. Unless adequate steps are taken early to protect trees and raise firewood plantations, a serious shortage of firewood is apprehended in rural areas, despite the availability of alternative fuel in some areas. Attempts have, therefore, to be made to formulate schemes for management of land resources lying between reserved forests and arable land to protect them from further deterioration, and to develop them as adjuncts to the rural economy, particularly for fodder and fuel. It will be necessary to plan for concerted action in this respect on the part of the forest, revenue, agriculture and animal husbandry departments in co-operation with village panchayats and *zila parishads*.

One of the new schemes will provide for co-ordinated research in forestry. This will be undertaken in close collaboration with the States under the overall guidance of the Forest Research Institute, Dehra Dun, and the Forest Research Laboratory at Bangalore. New regional research centres will be established at Gauhati and Jabalpur. The schemes of research mainly relate to plantation programmes and ecological studies. Attention will be given to collection of more comprehensive statistics.

The schemes of pre-investment survey of forest resources will be extended to 75,000 sq. km. of forest areas. The project for training forest officers and the field staff of forest labourers' co-operative societies and of forest contractors in the use of basic logging tools and on the planning of logging operations will be continued.

TABLE XLI

F—Stands for financial achievement in million rupees.

P—Stands for physical achievement in thousand hectares in respect of plantation schemes and thousand kilometres in the scheme of communications.

**Forest Policy :** The beginning of scientific forestry in India may be reckoned with the appointment of an Inspector General of Forests in 1863. The forest management was to aim at :

1. retaining under forests whatever forest areas happened to be available at the time,
2. protecting such areas against misuse by the people,
3. maintaining them under proper silvicultural treatment,
4. limiting timber removals to what would be permissible under sustained yield principles, and
5. improving the forest crop by artificial cultivation.

A regular forest policy on these lines could not, however, be laid down earlier than 1894. The Royal Commission on Agriculture also made certain recommendations with a view to increasing the utility of forests as follows :

1. Appointment in each province of a forest utilization officer, whose main function should be to develop forest industries.
2. A reclassification of forest areas into a major division in charge of commercial forests and those necessary on physical and climatical grounds, and a minor division in charge of minor forests, fuel plantations, village woodlands and waste lands.
3. Transfer of wooded areas then under the control of Forest Department to village management through properly elected committees or panchayats on the lines adopted by the then Madras Government.
4. Institution of short courses at the agricultural colleges for all newly recruited forest officers to foster a closer touch between the Agricultural and Forest Departments.

No concrete steps were taken by Government to implement these recommendations. Forests being an important source of revenue in many States, there is often a tendency to overfelling, ignoring the needs of sound management. Sometimes a programme of expanding forests clashes with the needs of agriculture and animal husbandry. These problems only underline the importance of a proper land use survey in which side by side with technical and economic consideration of land capability, due consideration should be shown to the local needs as well. Further, forests being a State subject, there is need for a sound management policy, and its implementation as well as co-ordination with the State programmes.

The Central Board of Forestry was set up in 1950, to implement the policy of development. The annual celebrations of *Van Mahotsava* (Forest Festivals) were also instituted simultaneously. *Van Mahotsava* aims at making the people conscious of the importance of

forests and urging them to contribute their share in preserving and developing the forest resources of the country.

Many changes have taken place since then in the pattern and extent of demand for forest produce. The protective functions of forests have been recognized. This necessitated a revision in the forest policy. The Government of India declared its new policy in 1952. The National Forest Policy as it was called, was formulated on the basis of six paramount needs of the country as detailed below :

1. The need for evolving a system of balanced and complementary land use under which each type of land is allotted to that form of use under which it would produce most and deteriorate least.
2. The need for checking :
  - (a) the denudation in mountainous regions, on which depends the perennial water supply of the river system, whose basins constitute the fertile core of the country ;
  - (b) the erosion progressing apace along the treeless banks of the great rivers leading to ravine formation and on vast stretches of undulating wastelands depriving the adjoining fields of their fertility ; and
  - (c) the invasion of sea sands on coastal tracts and the shifting of sand dunes, more particularly in the Rajasthan desert.
3. The need for establishing tree lands, wherever possible, for the amelioration of physical and climatic conditions promoting the general well-being of the people.
4. The need for ensuring progressively increasing supplies of grazing, small wood for agricultural implements and, in particular, of firewood to replace the cattle dung for manure to step up food production.
5. The need for sustained supply of timber and other forest produce required for defence, communications and industry.
6. The need for the realization of the maximum annual revenue in perpetuity consistent with the fulfilment of the need enumerated above.

These vital needs actually indicate the functions the forests are to perform and provide the fundamental basis of the policy governing their future.

In brief, the policy aims at evolving an efficient management and progressive development of forests. As a target to be achieved over a period, it was decided to raise the area under forests to one-third of the total geographical area.

The immediate objective of forestry development is to attain self-sufficiency in industrial and commercial timbers, in fuel wood and other forestry products required by consumers and ancillary industries. This objective is proposed to be achieved (i) by increasing the area under man-made forests for most efficient and economical utilization of space ; (ii) by increasing productivity of existing forests through better logging techniques and tools ; (iii) by improvement of communications so that hitherto untapped resources can be exploited; and (iv) by popularization of the use of secondary timbers after proper seasoning and preservation treatment. Accordingly, activities under the various schemes, namely, (1) plantation of quick-growing species, (2) economic plantation for industrial and commercial uses, (3) rehabilitation of degraded forests, and (4) farm forestry-cum-fuel plantations were intensified during the year. Development of communications was also accelerated to increase the accessibility to forests. As against 1.36 lakh hectares of man-made forests raised during 1969-70, 1.39 lakh hectares are likely to be planted with industrially important species during the year under review.

The growing industrial and economic development needs of the country have necessitated the maximum exploitation of forest resources. Measures for raising productivity and setting up man-made forests on a large scale to meet country's demand for raw materials are being intensified, with special emphasis being laid on raising plantations of fast growing species and other valuable commercial species, rehabilitation of degraded forests, better extraction techniques, improvement of forest communications and popularizing the secondary species of timber after proper seasoning and preservative treatment.

The Centrally sponsored project for "pre-investment survey of forest resources", has thus been in operation since 1965, with assistance from the United Nations Special Fund for investigating the economic availability of raw materials for the development of wood-based industries in the northern, central and southern zones, covering a total area of about 3 million hectares. Under this project, good progress has been made in assessing the raw material availability and possibility of development of wood-based industries in these areas. During the year 1968-69, small and large scale aerial photographs were taken in various zones. Field work on forest inventory has been almost completed in the southern zone. Besides, field manuals for the north and south zones and manuals for industrial plantations and species, elimination trials, investigations on costs and methods, etc. have been prepared.

APPENDIX  
Classification of Forest Area

| State/Union Territory and Year | Geographi-<br>cal Area | Total<br>Forest<br>Area | Classification of Forest |                                      |          |              |           |                              | (Sq. Kilometres) |

## CHAPTER VII

# MINING

### L Mining Before Independence

Perhaps the earliest use of minerals during pre-historic times by mankind was in the form of primitive implements made of agate, flint and pitchstone. From that stage, man has steadily advanced to the art of employing minerals for innumerable uses. In fact, today we have become so much dependent on mineral products that the very existence of civilization without them may be considered impossible, for they provide us with the materials for building humble dwellings or skyscrapers, domestic appliances, agricultural implements, for the manufacture of mineral fertilizers vital to agriculture, lighting and power, means of transport on land, sea and air, and a large variety of implements, tools and machines used both in peace and war, besides serving as a medium of exchange of singular importance in international credit and national stability.

Even before the industrial era the lure of minerals and the craving for precious metals had profoundly affected the trend of history by encouraging exploration, inciting conquests and promoting spread of civilization. India is said to have been one of the most important centres of trading for diamonds, gold, emeralds and sapphires. The export trade of these precious commodities attracted the attention of the West and created an irresistible lure to acquire such interests. Columbus, while attempting to find a sea-route to India, discovered America. Thus minerals have played an ever-increasing role in world affairs, and today a fervent search is being made all over the world for uranium and other atomic minerals to manufacture nuclear weapons for war purposes and to utilize atomic energy in peace.

**History of Mining in India:** India has a long tradition in mining and smelting of gold, copper, lead, zinc and iron ores and mining and cutting of diamonds. Until 1886, the entire diamond wealth of the world had its origin in India. As far back as 300 B.C., Kautilya wrote, "Mines are the sources of treasury". Gold, copper, lead, silver and zinc were mined long before iron ore is known to have been worked in India, for the last 3,000 years or more. It is said that the famous "Damascus" swords of medieval age were made of iron imported from India. There was commerce between India on one hand and Egypt, Africa, Arabia, Persia, the Near East, and several other countries on the other before the dawn of the Christian-era. That Indian steel was of great antiquity

is borne out by the fact that it was thought worthy of a king's present. King Poros is said to have presented 13.63 kg. of Indian steel to Alexander the Great (326 B.C.). The famous pillar near Qutub Minar, Delhi, is of solid wrought iron of excellent quality produced in India by indigenous small furnaces, and has stood the ravages of weather without showing signs of rust.

Although there is enormous evidence of the ingenuity, skill and industry of ancient miners of India in mining gold, silver, and diamond and smelting of ores, or even when the first tonne of Indian coal was struck in the Raniganj coal-fields as far back as 1775, or even when in 1843 the first Joint Stock Coal Co. was registered, systematic mining on an appreciable scale had been attempted only towards the close of the 19th century.

**Mineral Industry from 1905 to 1946:** The development of industries in India before independence, though steady, had been rather slow; therefore, mineral development which had necessarily to keep pace with the growth of other industries requiring the use of mineral raw materials was also very slow. The total value of mineral production of the former Indian Empire (including Burma & Pakistan) in the year 1905 was about Rs. 100 million. Only 15 minerals of economic importance were mined. There were 650 mines (301 coal and 349 non-coal) which employed nearly 110,000 persons. The mines were mostly working near the outcrops and the method of mining in many cases was primitive. Out of 301 coal mines 271 were located in Raniganj and Jharia coal-fields. The production of coal was 8.57 million tonnes. In order of value, the minerals produced were: gold, coal, manganese ore, petroleum, salt, saltpetre, mica, ruby, spinel-sapphire, lode stone, graphite, iron ore, tin ore, chromite, diamonds and magnesite.

The production of manganese from mines near Vijayanagaram which were started in 1891-92 had reached 64,300 tonnes in 1905 and over 112,200 tonnes in 1906. The production of manganese ore from the world-famous deposits of the Central Provinces (now forming parts of Madhya Pradesh and Maharashtra) in the new fields was over 154,000 tonnes in 1905 and rose to some 359,000 tonnes in 1906. Elsewhere in India, considerable activity followed the quest for this mineral with the result that by 1906, work was in progress in Sandur, Singhbhum, Panch Mahals and Mysore (Karnataka), so it can be said that by that year, principal Indian manganese deposits were in production with the output reaching 591,000 tonnes out of the world total production of 1,474,000 tonnes.

The factors responsible for the growth and expansion of the mining industry in India were the domestic need for coal, petroleum, iron and steel, gold and salt and the foreign demand for manganese ore and mica. With progressive industrialization, gold which was in the lead, yielded

the first place to coal for good since 1907 and second to petroleum from 1919 to 1931. On the separation of Burma with nearly 70 per cent of the total petroleum output, it regained its second place.

Mining of lead, silver and wolfram commenced in 1909 in Burma, while exploitation and export of monazite from Kerala started in 1911. Thorium extracted from monazite is used for the manufacture of gas mantles. With the establishment of the Tata Iron and Steel Company the mining of iron ore was considerably stepped up and steel production added to the domestic industry in 1912. This also strengthened the demand for coking coal, and the price of coal which had fallen to the lowest yet on record in 1911, improved in 1912 with increasing momentum which continued till the outbreak of World War I in 1914.

During the First World War period from 1914-18 the output of certain minerals and metals like lead, silver, wolfram and tin of Burma, coal, salt, chromite and saltpetre was stimulated. The low demand for manganese ore reduced the output of this mineral, but the increase in price marked the reduction in output. Gold showed a decline in output as well as in value which led to the closure of certain mines. Zinc concentrates from Burma and copper ore mainly from the Singhbhum area were other additions to the list of minerals produced. Ferro-manganese was manufactured in the country from 1917.

The entire demand for refractories other than fire-clay refractories was being met by imports. The First World War provided the Indian refractories industry an opportunity to expand. In 1915-16, Bird & Co. Ltd., added a Silica Works at Kumardhubi; in 1917-18, the Reliance Firebrick & Pottery Co. Ltd. came into being at Chanch; a little later the Behar Firebricks & Potteries Ltd., and the Bengal Firebrick Co. Ltd., and two other small concerns started manufacturing fire refractories. At the end of the war, Burn & Co. too added a Silica Section to their Raniganj factory. The expansion of the refractories industry gave a fillip to the mining of fire clay, China clay, silica, bauxite, felspar, kyanite, sillimanite, chromite, magnesite and dolomite. The number of mines (coal and non-coal) rose from 781 in 1910 to 1718 in 1920, which means that the activities of the mining industry were more than doubled during that period of 10 years; the total value of minerals produced rose from Rs. 12 crores to nearly Rs. 18 crores. Due to difficulties of procurement, the value of imports of minerals and metals, which were mineral oil, salt, copper, iron and steel, declined from nearly Rs. 29.25 crores in 1914 to nearly Rs. 17.7 crores in 1918. The effect was wholesome to India which made her self-supporting in iron and steel and led to the establishment of several industries including a small charcoal blast furnace at Bhadravati (Karnataka) in 1923. A steady increase in the value of mineral production was continued till 1924 when it reached a figure of nearly Rs. 28 crores excluding petroleum. India

became the largest producer of ilmenite since 1927. The production of copper from Rakha mines was short-lived and the mines were closed in 1924.

**Trained Personnel for the Mining Industry:** No industry can develop on sound lines unless trained and experienced technical persons are continuously available to it. Although the mining industry of India progressed rapidly during the first two decades of the present century, the availability of trained personnel was unsatisfactory. The country had to look up to Britain to meet its entire demand of experienced and qualified mining engineers, as there was no college or institution in India for training of mining engineers.

The Indian National Congress recognized the need for such a college as early as 1901, and adopted the following Resolution at its Calcutta Session in 1901.

"Resolved that this Congress notices with satisfaction the rapid progress of the mining industry of India and in consideration of the fact that the mineral resources of this country are vast and the facilities for acquiring a thorough knowledge of mining engineering in this country are almost nothing and in view of the fact that the tendency of recent legislation on mining namely Act VIII of 1901, is that all Indian mines must be kept under the supervision of mining experts, this Congress is of the opinion that a Government College of Mining Engineering be established in some suitable place in India after the model of the Royal School of Mines in England and the Mining Colleges of Japan and the Continent."

It was only on September 11, 1920 that the long awaited decision of the Government of India was announced. An all-India institution, financed by the Central Government providing high grade specialized instruction in mining engineering and geology and in other subsidiary and allied branches of science and engineering was to be established at Dhanbad.

Dr. D. Penman was appointed Principal of the new Institution in 1921. He submitted his scheme in 1922, which was accepted by the Government of India. But it was subsequently pruned as the Government of India slashed the estimates from Rs. 22 lakhs to Rs. 14 lakhs. Due to various impediments, it took nearly four years for the Institution to start functioning in December 1926.

Following the pattern and terminology adopted in naming the Royal School of Mines, London, the Institution was named Indian School of Mines.

The Indian School of Mines, Dhanbad, has been doing excellent work in maintaining a very high standard of training. Thus we find that most of the top and senior positions in Government departments,

public sector undertakings, mineral industry and a host of other technical organizations requiring mining or geological qualifications, are held by the alumni of this Institution.

The Banaras Hindu University was a pioneer in starting courses in mining and metallurgy of the degree standard. The first batch graduated in 1927; since then it has been making a very useful contribution to the mineral industry of India by way of supplying trained mining engineers and metallurgists.

The Indian mining industry experienced a great depression in 1930. Production declined considerably and the value of the production (excluding petroleum) which had touched Rs. 28 crores in 1924, fell rapidly to Rs. 14.70 crores in 1932. The quantity and value of production of coal, mica, manganese, chromite and iron ore fell steeply. The output of gold which had also gone down was arrested in 1931, when Britain went off the Gold Standard. Most of the manganese mines were closed down with almost complete cessation of work in the Central Provinces (Madhya Pradesh) in 1932. With the opening up of Mosabani Mines and the setting of copper smelter at Monbhandar near Ghatsila in 1927, steady production of copper was started.

The recovery of the Indian mining industry slowly started from the latter part of 1933 and a definite rising trend was visible in 1934. The industry has since shown a continuous increase in output. Production of coal, iron ore, mica and manganese reached a respectable figure. The value of mineral production in 1938 increased from Rs. 14.79 crores in 1932 to Rs. 33.81 crores. The output of coal reached 25.275 million tonnes in 1937 and the average price of Bengal Coal which was around Rs. 3.25 in 1936 slowly moved up to Rs. 3.94 per tonne in 1937.

A very important event which took place in the history of Indian Mining was the ban on employment of women below surface. It came into force from October 1, 1937.

Arising out of the Indian Coal Mining Committee's recommendations (1937), increased Government control was exercised over the mining for safety including compulsory stowing where necessary. On May 27, 1939, the Coal Mines Safety (Stowing) Act, 1939, was brought into force and a Stowing Board was constituted the following month.

On the separation of Burma, the value of mineral production in India fell from Rs. 33.81 crores before separation to Rs. 21.55 in 1939. The drop was the result of the loss of nearly 70 per cent of petroleum, the entire production of tin, wolfram, nickel-speiss, ruby, lead and zinc ores and the loss of a large part of copper and silver.

**The Second World War (1939-45):** Difficulties of availability of labour were experienced in the mining industry, as people could get employ-

ment elsewhere during the war-period. This was a signal for a fall in output.

Although the output of coal, gold, mica and copper had fallen, the price was, however, continuously on the rise since 1939, so that the effect of the decline in production was more than offset by the increase in the prices of commodities, particularly of coal, gold and mica. The value of mineral production in 1943 was registered at Rs. 32.36 crores. From 1946, practically all the minerals showed an increase in output, and the value of production exceeded a little over Rs. 49.23 crores in that year.

With the outbreak of war the value of imported minerals and mineral products continued to rise and in 1941, it touched Rs. 41.07 crores. There was a fall in 1942, but it shot up to Rs. 91.58 crores in 1944 and to Rs. 116.71 crores in 1945. The most stimulating effect of the war was the unprecedented rise in the production of iron and steel. The production of pig iron was attained to the full installed capacity of 2.32 million tonnes and that of steel to 1.086 million tonnes in 1941. India exported about 0.508 million tonne of pig iron to Japan, U.S.A., and U.K. The output of iron ore rose to over 3.048 million tonnes.

Aluminium metal was produced from imported alumina in 1943 and from Indian bauxite in 1944. Lead-zinc and emerald mining was started in Rajasthan. Mica mining in Rajasthan also received a stimulus during the war.

**Indian Mining Industry on the eve of Independence:** The Second World War showed that the establishment of a healthy and sound mining industry was the backbone of all major industries. It required a change in the attitude of the Government towards the industry which had so far been almost neglected. There was no definite policy for the development and utilization of minerals. The minerals were worked in an unscientific manner. Interest had been shown only in the high grade and easily accessible and mineable minerals and ores to feed as raw materials for foreign industries without any consideration for the conservation or proper utilization of the mineral wealth of the country. Low and marginal grades of ore were dumped along with mine spoils and in several cases even good grades of iron and manganese ores were used as road metal.

Problems of waste, fire, flood, explosions, sound mining practices were lost sight of during exploitation of mines.

Mining leases were granted for any length of time and for any area in disregard to the capacity, technical ability or financial resources of a lessee or to the present or future requirements of the country. The rates of royalty also varied from lessee to lessee. None of these conditions were conducive to scientific development of minerals in the country. Thus minerals which are the real wealth of a nation, and cannot be

replenished by human efforts, were allowed to be indiscriminately worked and depleted.

No attempt was made to beneficiate or upgrade low grade ores to marketable or usable standards though nature had endowed India with the largest reserves of iron ore of good quality in the world. It has small reserves of coking coal (metallurgical quality); yet no thought was given to conserve as far as possible coking coal and use it only for metallurgical purposes. It was freely used for steam raising in locos and in brick kilns. No serious attempt was ever made to locate fresh workable deposits and assess the potentialities of known deposits of minerals in which there was a big gap between the production and existing and future demands of the country. There was no restriction on exports of minerals in short supply. Technical services pertaining to the mineral industry were ruthlessly cut down during the World Depression of 1930.

In short, there was no attempt to develop a self-reliant and self-sustained economy for minerals which could hold out a promise of starting mineral based industries, which would provide to the people a continually rising standard of living, more opportunities for gainful employment and a sense of security and self-sufficiency both in peace and war.

## II. Problems and Policies since Independence

**National Mineral Policy:** The foremost task for the new Government of India was to have a determined National Mineral Policy and to shift the emphasis from the whole-sale export of high grade minerals to the local manufacture, where possible, of finished goods, restricting exports of minerals in short supply and thereby conserving them. The plan was to effect a greater measure of Government control to achieve the desired objectives.

Mineral exploration programmes were now to be directed towards developing the potential mineral wealth of the country to the maximum extent possible, to provide the necessary mineral raw material base for industrialization and to make significant contributions to the national economy through foreign exchange savings and earnings. Thus in relation to this larger objective, scientific, systematic and integrated programme of exploration have become of far greater consequence than a random search for buried treasure.

**Problem of Nationalization and Public Sector Undertakings:** There are many generally accepted arguments in favour of or against nationalization; but greater need and urge is felt for nationalization in under-developed rather than in industrially advanced countries. Also increasing Government control of private investments, particularly that of foreign capital,

is usually justified on account of the general cost benefit consideration, fixation of priorities, its effect on the country's balance of payments, its control over the development of key or strategic minerals and the need for planned economic development, so that there is a balanced growth of economy, most efficient utilization of capital resources and avoiding duplication or overlapping of efforts. The fear of sudden nationalization hampers the growth and efficient working of the private sector, therefore, if the private sector has to play any part in the industrial activities of the nation and there is no reason why it should not help in the task of nation building, then it is necessary for the State Government to enunciate its policy clearly.

Broadly the principles governing this policy are that the development of the minerals which cannot very well be carried out by the private sector for various reasons, should of course be given priority in the programmes of the public sector undertakings to form a well integrated development plan. Development of minerals of marginal grade which has been neglected by the private sector and development of minerals of strategic importance and mining projects requiring large investments must necessarily be taken up by public sector undertakings. It is also true that policies of any State cannot remain stagnant for a long period; in cases where compelling circumstances necessitate nationalization of any particular industrial unit, the law of the land should provide for payment of reasonable compensation determined by impartial authorities. The State must also reserve its right to bring about such changes in the degree of control of any unit in the public interest as may be considered necessary from time to time.

**Regulation of Production:** Regulation of production by the State through legislative controls is inevitable to achieve planned economic development. The need for regulation of production may also arise from strategic considerations, lack of adequate known resources of particular minerals, need for conservation of mineral resources for future use and to balance output of a particular type or quality of minerals according to their consumption in certain selected industries etc. For example, in India, known resources of coking coal are very limited compared to those of iron ore; therefore, a need has been felt to peg the production of coking coal to the requirements of the existing metallurgical plants. Similarly, minerals of strategic importance of limited known reserves may be subject to production controls, all the more so when they are likely to be required in substantial quantities in the near future for indigenous industries.

**Conservation of Mineral Resources:** Mineral resources are wasting assets and yet modern civilization is making more and more use of

minerals necessitating a continuous increase in their production. Therefore, enforcement of conservation measures are essential not only in the interest of a particular nation but that of the whole world. These conservation measures may provide for the systematic exploration, prospecting, mining, milling, concentration, beneficiation, etc., by scientific and efficient methods, obtaining the maximum possible recovery of the subsidiary associated minerals, blending of ore, substitution of some high grade minerals by other synthetic products or lower grade minerals for certain purposes, grant of subsidies and allowances to make fruitful use of the minerals in general. Although selective mining of high grade minerals alone, may yield spectacularly high profits but generally it leads to lowering of valuable reserves and hence may not be beneficial from an overall national point of view. Valuable by-products, although economically recoverable, may not be recovered by mine owners either because of their inability or unwillingness to invest additional capital or because of the possible resultant decrease in rates of profits even though they may be quite just or proper. Thus to conserve the country's mineral resources by elimination of avoidable waste during mining, processing and utilization is considered absolutely essential.

**Mineral Beneficiation and Ore Dressing:** Some of the vital technical fields have remained unattended for a long time in India, though there has always been a pressing necessity of developing them. Ore dressing is unquestionably one of them having strong bearing on the mineral development of the country; without proper utilization of the so-called low grade ores the mineral industry can never be put on a firm economic footing. This is especially true when we consider that hardly, if at all, the high grade ore could be mined as such, without at the same time, producing a large quantity of low grade or marginal grade of ore. In all foreign countries the case of progress of ore dressing has always proceeded parallel with the mining activities.

India has vast deposits of low grade ore lying untapped, which could be utilized if proper beneficiation techniques are employed; and in this respect special attention needs to be paid to manganese ores, coal, mica, chromite, ilmenite, asbestos, kyanite, and atomic minerals.

**Grading and Marketing:** Mineral resources may be developed either to meet local indigenous demands or for export with or without any treatment, concentration etc., or for both. Production of finished, or semi-finished products from minerals permits the full benefit such as employment opportunities, development of subsidiary industries, considerable enhancement of value and steady market demands etc. In an under-developed country like India which is on the threshold of economic and industrial progress, the capacity to earn foreign exchange by export of

finished products is small and the need to import capital goods is great. In order to maintain a proper balance of foreign currency earnings and payments, this gap can only be filled by export of raw minerals judiciously selected for the purpose, keeping the present and future local needs in view. Strict quality control is essential to ensure that substandard minerals are not supplied either for the internal market thereby lowering the efficiency of production units and the quality of their products or for export.

**Export-Import Policies:** Export-import policy in minerals is deeply related to the foreign exchange situation and other economic considerations, mineral conservation policies, strategic considerations, and known resources of minerals etc., all of which are liable to change from time to time. Therefore, this policy has to be formulated only for short periods. The main object is to encourage development of indigenous industries either for export promotion or for import substitution by, if necessary, protecting them from competition with imported material particularly during the initial stages or giving them assistance by way of reduction in railway freight, royalties and export duty or cesses and payment of subsidies to become competitive in price and quality in any or all foreign markets. Such policies have been framed from time to time by the Ministry of Foreign Trade in consultation with the Department of Mines and Metals.

**Safety and Welfare of Workers:** Both from the management as well as from the workers' point of view the safety and welfare of workers is very important. O.M.S. (Output per man shift) in India is very low, hardly 0.5 and in many cases just over 0.4. It can certainly be improved by better mining conditions underground, better lighting, adequate ventilation, by providing fatigue removing implements, adequate medical facilities, elementary training in principles and methods of mining, better wages and incentive bonus, better housing, recreation clubs, canteens, pit-head baths, creches etc.

If India has to build and develop the mining industry, there should be no outside political interference or influence on miners' unions. Such influence leads to proliferation of trade unions in the industry. Each mine should have its own labour councils manned by representatives of management and workers, where problems concerning the safety and welfare of workers, their wages and bonus, problems of better O.M.S and problems of reducing production costs should be discussed and solutions found for them.

**Mineral Policy:** A Mineral Policy Conference was held at the beginning of 1947. It unanimously agreed upon the advisability of formulating a well co-ordinated national mineral policy to ensure planned develop-

ment of the mineral resources of the country and to establish a complete technical organization to maintain close liaison among the various ministries and departments of the Government of India as well as to advise them on all matters concerning minerals. As a result of this Conference, the Indian Bureau of Mines was constituted in 1948.

During the first two years of its life, the Bureau functioned as an advisory body. With the passing of the Mines and Minerals (Regulation and Development) Act, 1948, the Bureau was assigned the following functions:

1. Advising the Central and State Governments on all matters relating to the grant of mineral concessions and on the exploration and utilization of the country's mineral resources.
2. Periodic inspection of mines for effecting systematic development of mineral deposits, elimination of waste and promotion of improved methods of mining.
3. Conducting research on the beneficiation of low grade ore and industrial utilization of minerals and mineral products as well as on mining problems in collaboration with other research organizations.
4. Conducting analyses of ore and minerals.
5. Collection and publication of statistics of mineral production, world mineral trade, foreign mining rules and other matters.
6. Assisting the mineral trade in the marketing of minerals.
7. Detailed prospecting of mineral deposits by means of drilling and exploratory mining.

**Expansion of Technical Departments:** The Geological Survey of India (G.S.I.) which began with a strength of 400 in 1947 was 8,400 strong in 1971. The National Metallurgical Laboratory, the Fuel Research Institute, a chain of other national laboratories and the Atomic Energy Department were established in rapid succession. The Mines Department, now named Directorate of Mines Safety, was suitably expanded to deal with safety of workers in mines.

Minerals being the basic raw materials for industrial development, mining of coal and lignite, mineral oils, iron ore, manganese ore, chrome ore, gypsum, sulphur, gold and diamonds, mining and processing of copper, lead, zinc, tin, molybdenum and wolfram and minerals specified in the Schedule to the Atomic Energy (Control of Production and Use) Order, 1953, were placed in the category of industries whose future development would be the exclusive responsibility of the State under the Industrial Policy Resolution of 1955.

To meet the requirements arising out of the changed conditions after independence several Acts have been passed and rules framed thereunder. Some of the important Acts and Rules are:

1. Mines and Minerals (Regulation and Development) Act, 1948,

substituted by Act 67 of 1957:

- (i) Mineral Concession Rules, 1949.
- (ii) Mineral Concession Rules, 1960.
- (iii) Mineral Conservation & Development Rules, 1958.
2. Mines Act, 1952:
  - (i) Mines Rules, 1955.
  - (ii) Mines (Posting up of Abstracts) Rules, 1954.
  - (iii) Indian Coal Mines Regulation, 1957.
  - (iv) Indian Metalliferous Mines Regulation, 1961.
3. Coal Mines (Conservation and Safety) Act, 1952:
  - (i) Coal Mines (Conservation and Safety) Rules, 1954.
4. Coal Mines Labour Welfare Fund Act, 1947:
  - (i) Coal Mines Labour Welfare Fund Rules, 1949.
  - (ii) Coal Mines Labour Welfare Office Establishment (Contributory Provident Fund) Rules, 1951.
5. Mica Mines Labour Welfare Fund Act, 1946:
  - (i) Mica Mines Labour Welfare Fund Rules, 1948.
  - (ii) Mica Mines Labour Welfare Office Establishment (Contributory Provident Fund) Rules, 1950.
6. Iron Ore Mines Labour Welfare Fund Act, 1960.
7. Iron Ore Mines Labour Welfare Cess Act, 1961.

**Mineral Development and Mineral Exploration:** Revolutionary changes have taken place in the purpose, scope, tempo and nature of mineral exploration in India after 1947 when the country became independent.

In the field of mineral exploration, the role of the Geological Survey of India relates to the preparation of basic geological maps and the regional investigation of mineralized districts. In addition to conventional geological methods, photo-geological, geo-chemical and geo-physical methods are employed. Ground mapping and aerial photographs in a number of mineralized districts such as the Zawar lead-zinc district, the Khetri and Dariba copper districts and the Singhbhum copper belt have been carried out. The geo-physical surveys, employing seismic, gravimetric, magnetic and electrical methods have been carried out to locate favourable structures for oil as well as in connection with exploration of concealed deposits in a variety of minerals including copper, lead, graphite, pyrites, diamonds, etc.

The activities of the Indian Bureau of Mines (I.B.M.) which came into existence in 1948 are widespread including the introduction of scientific methods of prospecting, exploring, mining and utilizing minerals through systematic and regular inspection of mines, detailed exploratory and proving operations to convert prospects into working mines, research investigations in mineral beneficiation and mineral technology; and the collection, compilation and interpretation of statistical data relating to

all aspects of India's mineral industry, such as production, consumption, marketing, import, export, reserves, grade, and utilization.

A few of the important results of detailed exploratory and proving operations carried out by the Indian Bureau of Mines are given below:

| <i>Mineral</i>           | <i>Reserves proved</i>                                     |
|--------------------------|------------------------------------------------------------|
| (a) Coal                 | 4940.29 million tonnes                                     |
| (b) Iron ore             | 959.0 million tonnes                                       |
| (c) Limestone & dolomite | 88.0 million tonnes<br>10.2 million tonnes                 |
| (d) Copper ore           | 100 million tonnes average grade 1% Cu.                    |
| (e) Copper-lead-zinc     | 0.36 million tonnes,<br>Total metal content 6.24%          |
| (f) Pyrites              | 76.2 million tonnes, sulphur content 40%                   |
|                          | Indicated reserve — 313.9 million tonnes                   |
| (g) Magnesite            | 12.19 million tonnes, containing about 41 to 46% magnesia. |

A separate Oil and Natural Gas Commission has been set up to carry out oil exploration on a major scale in the country. In addition to the conventional methods, the latest methods are employed by the Commission including aeromagnetic surveys, geo-physical surveys and photo-geological surveys. Notable success has already been achieved in the Cambay and other areas in Gujarat.

The Department of Atomic Energy is carrying out extensive radio-metric surveys, both on the ground and by air, in their search for deposits of radio-active minerals.

In order to beneficiate any given ore, it is first necessary to undertake systematic research on a representative sample of the ore to evolve a suitable process. It has been rightly said that no two ores are identical in their amenability to beneficiation. These studies should be supplemented by tests on a pilot plant scale to work out the proper flow-sheet and collect all the relevant data which are very necessary for designing a suitable beneficiation plant.

**Exploitation of Minerals by the State:** In order to exploit deposits of coal, iron ore, copper, diamonds, pyrites, proved by the Indian Bureau of Mines and the Geological Survey of India, the Government of India have set up a number of Corporations in the Public sector. These are:

1. The National Coal Development Corporation (N.C.D.C.) for working coal.

2. The National Mineral Development Corporation (N.M.D.C.) for working minerals other than coal.
3. The Pyrites & Chemical Development Corporation to work pyrites at Amjor (Bihar) and at Saladipura (Rajasthan) for sulphur.
4. The Metal Corporation of India was taken over by the Government of India in 1965 and a new undertaking, Hindustan Zinc Ltd., was set up to run mines and smelters.
5. Copper has been transferred from N.M.D.C. to Hindustan Copper.
6. The Uranium Corporation of India is in-charge of the deposits at Jaduguda Mines in Bihar.
7. The Neyveli Lignite Corporation is now owned and run by the State of Tamil Nadu to mine the lignite deposits at Neyveli.
8. For trading in minerals and metals the Minerals and Metals Trading Corporation (M.M.T.C.) has been established.

A long awaited decision of the Government regarding the conservation of fast depleting resources of coking coal as compared to vast reserves of high grade iron ore in the country, was announced on October 17, 1971, taking over 214 coking coal mines. Bharat Coking Coal Corporation has been formed to work these mines. Non-coking coal mines have also been nationalized and are now worked by the Coal Mining Authority.

### III. Survey of Mining Industries

**Coal:** The workable coal measures of India belong to the Upper Palaeozoic and the Lower Tertiary. Workable coal seams are confined to Lower Gondwanas in the case of the former and in the case of Tertiary the workable seams occur in the Eocene. The Gondwana coals are of bituminous and sub-bituminous quality while the Eocene coals are generally lignite. In the Himalayan mountain area, however, higher rank coals are occasionally met with, the process of maturity having been accelerated by the abnormally high tectonic pressures which accompanied the growth of Himalayas.

The Gondwana coal-fields are spread over Assam, West Bengal, Bihar, Orissa, Madhya Pradesh, Maharashtra and Andhra Pradesh, while Tertiary coal-fields occur in Assam, Gujarat, Jammu and Kashmir, Rajasthan, Pondicherry and Tamil Nadu.

The earlier history of Indian coal mines is somewhat obscure; but the claims that the use of coal is entirely a western fuel introduced into India is untenable in the face of indigenous place names of localities like Damodar, Barakar and Kali Pahari which are still amongst the most important centres of coal mining. All these show that the existence of coal and its use in the area was known long before Summer and Heatly applied for their concession in August 1774, in Raniganj (Bengal).

Coal mining started in 1862 in the Central Provinces (Madhya Pradesh), and in the former Rewa State in 1884. The Singareni collieries went into production in 1887. Coal mines in Upper Assam were opened in 1881, while the Jharia coal-field was opened in 1893. Development of the Jharia coal-field was so rapid that in 1906 production exceeded that of the Raniganj field and India produced over 8.13 million tonnes of coal.

In the absence of railway facilities, expansion of the coal industry was slow for many years. By 1860, the annual output of coal had reached only 37,750 tonnes. Mining methods were primitive and only the outcrop coal was worked to shallow depths. Gins were used for lowering and raising buckets of coal and water. Miners used picks and carried baskets of coal on their heads.

**Trends in use of machinery in Coal Mines:** The Pulsometer type steam pump was perhaps the first mechanical plant used in Indian mines. A 10 h.p. steam engine was employed in 1852 to raise coal replacing manual labour. From 1900 onwards, simple mining machinery like rope haulages and pumps were introduced. In 1906 the first colliery power station of 400 KVA (kilovolt ampere) was installed by the Bengal Coal Co. at Sodepur. The advent of electricity in the mines was a great technological stride towards mine mechanization. In 1925 out of 810 mines, 108 were using electric power. In 1950, out of 848 working mines, 345 were electrified and had installed electric machinery of the order of 372,000 h.p. In 1966, 661 collieries were using electric energy of the aggregate horse power of 610,006.

The use of mining machinery has steadily increased. In 1925, there were 125 coal-cutting machines in use, in 1950 there were 399 coal-cutting machines employed by 120 mines and in 1955, 151 coal mines were cutting coal with 527 coal-cutting machines. In 1960, 199 collieries produced 14 million tonnes of coal by machines i.e. 27% of the total output. The number of coal-cutting machines further rose to 738 in April 1963, and 1,588,939 tonnes of coal was cut by them. While in 1966 the number of coal-cutting machines worked by electricity was 951. The number of mechanical loaders rose from 7 in 1951 to 23 in December 1960, and those of coal conveyors rose from 23 in 1951 to 106 in March 1961, and to 162 in April 1963. In 1960, more than 481,000 tonnes of coal was conveyed by coal conveyors. During 1969 more than 200 conveyors were in operation. Another important feature in mines in India has been the use of more and more of electric safety lamps in place of *mug bottles*. By 1966, the number of safety lamps rose to 254,853 out of which 240,647 were of electrical type.

**Size of Mine and Pattern of Production:** The average annual output of coal per mine in 1925 was 25,000 tonnes. A number of small mines were closed during the general depression in the thirties and the average output increased to 41,000 tonnes. During World War II, as the demand for coal shot up, many small mines sprouted again and the average output per mine registered a fall and was only 27,550 tonnes in 1945. Since 1950, there has been a steady rise in the average output per mine and it has increased from 36,700 tonnes in 1950 to 61,000 tonnes in 1960. Still only 18% of the mines produced more than 10,000 tonnes a month while 32% produced less than 100 tonnes a day or 2,500 tonnes a month and another 18% produced less than 600 tonnes of coal per month. But there are 40 collieries producing more than 25,000 tonnes of coal per month and four of these produce more than 75,000 tonnes per month.

A definite change in the pattern of production is noticeable, as until 1958 only 13% of the total production came from open cast workings while 87% was accounted from underground. But there is a steady rise in the production from open cast workings due to the opening up of new large-scale quarries in the public sector by N.C.D.C. During the next decade or so several other open cast mines will be opened by the public sector to meet the increased production targets. At present, upto 1:3 (coal to overburden ratio) is planned for open cast workings, but this ratio is likely to go upto 1:5. Thus large-scale quarrying may become a permanent feature in Indian coal mining. Now the N.C.D.C. produces over 9 million tonnes of coal annually from its open cast mines. They are semi or fully mechanized, employing power shovels, draglines and dumpers. The dragline employed at Bisrampur open cast mine has a bucket capacity of nearly 30 cubic metres.

Deep shafts are also being sunk for mining coal from deeper horizons and a number of coal mines will be operating at depths of nearly 186 metres in the near future.

**Coal and Five Year Plans:** Coal being classed as a schedule 'A' mineral, its future development will have to be carried out by the State. The idea of having a master plan for coal mining development in India was prepared by the Chief Mining Engineer, Railway Board, in 1950 showing the actual and potential capacities of different coal-fields and also the estimated requirements of the country. The estimated increased demand of coal during the First Plan period was of the order of only about six million tonnes, which was considered to be met with in the normal production capacity of the industry.

With the Second Plan the position changed considerably as more emphasis was laid on industrialization and to meet its fuel requirements the production of coal had to be increased from 38 million tonnes to 60 million tonnes. To achieve the required additional production of

22 million tonnes, within a period of five years was a stupendous task. The private sector as a whole could not raise 60 million tonnes. The Government had to step in to open out new areas and establish new mines. The additional production was shared between the private sector and the public sector — 12.3 million tonnes and 10.5 million tonnes respectively. An autonomous Government undertaking the National Coal Development Corporation with the eleven old railway collieries as its nucleus was established on October 1, 1956 to accomplish this task. The N.C.D.C. is now operating 52 collieries.

Unrestricted access to under-developed coal bearing areas had to be given to Government and for the purpose of speeding acquisition of coal bearing areas, the Coal Bearing Areas (Acquisition and Development) Act, 1957, was enacted.

Opening out of new mines or for extending the working of existing mines to virgin areas require considerable data regarding the behaviour, attitude, geological disturbances, overburden, thickness, strike and dip of the coal seams, reserves, grade and washing characteristic of coal for planning their opening. Co-operation and assistance was taken of existing technical organizations, the G.S.I. and the I.B.M. The I.B.M. put in all its resources for detailed prospecting of Korba, Kathara, Bistrampur, Jhilimili, Giddi, Talchir, Ramgarh, Kargali, Bokaro and Satpura fields, and supplied N.C.D.C. all the data including the ratio of overburden to coal, and floor contour. To supplement the work of the I.B.M. and G.S.I., the N.C.D.C. also organized a prospecting section. During the Second Five Year Plan, the N.C.D.C. opened 11 more collieries and achieved an annual production rate of 10 million tonnes. Production from the 11 old collieries was also expanded from 2.9 million tonnes to 3.6 million tonnes.

The private sector did its share and the output of coal reached 56 million tonnes in 1961; the share of N.C.D.C. and Singareni collieries was 10.3 million tonnes.

In the Third Five Year Plan, the target of coal production was fixed at 97 million tonnes, the share of public sector and private being fixed at 37 million and 60 million tonnes respectively. The I.B.M., the N.C.D.C. and G.S.I. have continued detailed prospecting by drilling during the Third Five Year Plan in selected blocks in various coal-fields in Bihar, West Bengal, Madhya Pradesh, Maharashtra and Jammu and Kashmir. As a result of drilling, the I.B.M. has discovered a deposit of coking coal in Chano Rikha area of North Karanpura coal-fields and more than 58 million tonnes of reserves of coal have been proved. The G.S.I. has proved a thick coal seam in Singrauli coal-field. These new discoveries are a valuable addition to the coal resources of the country. The G.S.I. and N.C.D.C. are carrying out exploratory operation for coal in the different coal-fields of Bihar, West

Bengal, Madhya Pradesh, Orissa, Jammu and Kashmir, Assam and Andhra Pradesh to enable the producing organizations to achieve and sustain the production targets for coal envisaged in the Fourth Plan and subsequent plans.

**Reserves:** Reserves of all grades of coal in seams of 1.4 metres and over in thickness are estimated to be of the order of 43,000 million tonnes within a depth of 609 metres. Inferred reserves are placed at an additional 80,000 million tonnes. Thus the total resources of coal inclusive of proved, estimated and inferred are placed at 123,000 million tonnes. Detailed exploration has shown that the overall position of coal resources in the country is considerably larger. Talchir coal-field alone may contain coal reserves of the order of 90,000 million tonnes.

Though in terms of quantity, coal resources appear to be large, the reserves of selected and grade I coal are limited. This is all the more so in case of metallurgical coal (coking coal). India is endowed with very large reserves of high grade iron ore (above 60% Fe.) whereas the reserves of coking coal suitable for metallurgical purposes have been assessed as 4,600 million tonnes upto a depth of 600 metres and are restricted to the Jharia coal-field in Bihar.

Consequently on shortfalls in the industrial complex of the country there was a setback in the coal production programme, in the Third Five Year Plan. The demand for coal slackened and production in 1965-66 was a little over 70 million tonnes against a target of 97 million tonnes. By the end of the Fourth Five Year Plan period, the requirements of coking coal by the steel plants alone, was expected to be of the order of 23 million tonnes, and 1.2 million tonnes of blendable coal; besides this quantity, another 3.6 million tonnes of coking coal was required for other cokeries. This involved a considerable increase from the current production of about 17 million tonnes. This situation, therefore, called for focussing attention on a measure of conservation of metallurgical coal by pegging the production of coking coal and using it only for metallurgical purposes, scanning the country for other deposits of coking coal, investigating the possibility of producing iron and steel by using non-coking, or coals of lower coking index and washing of low grade coking coal to reduce the percentage of ash.

The Government has, therefore, taken over 214 coking coal mines placing them under a Government undertaking named as Bharat Coking Coal Co. High priority has been assigned to the coking coal programme for the future Plans. In addition to the various coking coal mines already in production, N.C.D.C. will contribute 2 million tonnes each from its two new mines, Sudamdih and Moridih. The non-coking coal mines have also been nationalized and placed under the control of the Coal Mining Authority. To achieve the target of

production of 97 million tonnes both the Coal Mining Authority and the N.C.D.C. are going ahead with their development and production plans. Prior to nationalization the private owned collieries were granted a loan of 35 million dollars by the World Bank for meeting their foreign exchange requirements.

The N.C.D.C. has launched its major schemes with the assistance and collaboration of Poland, France, West Germany, U.S.S.R. and the U.S.A. The British National Coal Board is willing to develop three gassy mines near Bokaro for 3 to 4 lakhs tonnes of coking coal annually. Umrer colliery in Maharashtra and a colliery in Talchir have been opened by N.C.D.C. for an annual production of 1 million tonnes of coal each.

Collieries in Satpura basin near Betul have been developed to supply coal for a super thermal power station near Ghora Dongri in Betul district.

The output of coal during 1970 was 72.51 million tonnes as against 74.21 million tonnes in 1969.

The requirements of coal in 1974-75 have been estimated at 95 million tonnes comprising 26 million tonnes of coking coal and 69 million tonnes of non-coking and blendable coal.

**Washing of Coal:** Good quality coking coals have been largely exhausted in the Jharia fields and the poorer quality of coals with high percentage of ash have to take their place. Therefore, washing of such coals has become a necessity. Four washeries in the private sector at Lodhna, West Bokaro, Jamadoba and Nowrozabad and five coal washeries in public sector at Kargali, Bogda, Patherdih, Bhojudih and Durgapur have been completed and two more new washeries at Kathara and Bhurkunda will be set up in the public sector. The existing washing capacity and that of the new plant is estimated to be 13.7 million tonnes of clean coal.

The problems facing the washeries in India are the distribution of ash in the segregation form in the coaly matter and the disposal of middlings. Unless power stations using middlings are set up near the washeries to improve the economics of clean coal, the cost of washing may become prohibitive when the percentage of clean coal is low in many cases. Again, the capital cost in setting up washeries to meet the entire requirements of coal for the steel plants may run into staggering sum of money in terms of foreign exchange unless the entire plant is designed and manufactured indigenously.

**Lignite:** Deposits of lignite at Palana in Rajasthan have been worked for several years now and the lignite is in use in the thermal station at Bikaner. The reserves are of the order of 22 million tonnes.

The Indian Bureau of Mines has completed detailed proving operations at Nichahoma in Jammu and Kashmir, and there is a scheme to exploit this deposit.

Neyveli lignite deposits in the South Arcot district of Tamil Nadu are the largest so far discovered. Exploration has revealed reserves of about 2,000 million tonnes of lignite over an area of 259 sq. km. A seam of lignite varying in the thickness from 0 metre to 27 metres occurs at depths of 54 to 75 metres. Under the lignite bed there is an artesian aquifer exerting a pressure of 6 to 8 tonnes per square foot (0.09 sq. m.). A pilot quarry 183 x 183 metres was excavated during 1953-54 and a pumping test was conducted which has revealed that, to control this pressure it would be necessary to pump out 2,05,000 litres of water per minute.

An integrated Lignite Project comprising the open cast mines, thermal power stations of 250 MW to be expanded to 400 MW, a Briquetting and Carbonization Plant with a capacity to produce 380,000 tonnes of carbonized briquettes per annum, besides a number of by-products like chardust, middle oil, phenols and kerosene, etc., a fertilizer plant with capacity to produce 152,000 tonnes of urea fertilizer, using about 0.5 million tonnes of lignite and a clay washing plant has been planned. Regular mining of lignite has been started, overburden is stripped by conventional earth moving machinery consisting of a shovel and loaders and specialized machinery consisting of bucket-wheel excavators and slewable spreaders. Two of the bucket-wheel excavators have bucket capacity of 350 litres; while the other two have bucket capacity of 700 litres. The output of 350 litres bucket-wheel excavators is 611.6 cubic metres of overburden per hour and that of 700 litres bucket-wheel excavators is 1529 cubic metres per hour. The disposal of burden from the mine to the spoil heap is done by belt conveyors and bottom dumpers, and the material is distributed on the spoil heap by slewable spreaders. For excavation of lignite alone, bucket-wheel excavators and belt conveyors are used. The mine is planned for an output of 3.5 million tonnes of lignite per annum (about 13,000 tonnes per day) which is expected to be raised to 4.8 million tonnes per annum when the thermal power station is expanded to produce 400 MW.

The output of lignite in 1963 from Neyveli was 987,174 tonnes, as against 174,805 tonnes in 1962, which rose to 2.56 million tonnes by 1966. The production in 1970 was 3.5 million tonnes. The entire quantity was from Neyveli open cast mine using bucket-wheel excavators. The production of lignite is expected to be enhanced to 6 million tonnes to meet the requirements of the increased capacity of the power station from 400 MW to 600 MW.

**Iron Ore:** The manufacture of iron from its ore in India can be traced to pre-historic times. It had markets in the Middle East, Egypt and East Africa even before the Christian era. The famous Damascus swords of medieval age were manufactured from the steel imported from India. It is known that at the time of Alexander's invasion (326

B.C.), Indians were as familiar with use of iron and steel in the battle field as the Greeks themselves.

The famous wrought iron pillar at Mehrauli near Delhi bearing an inscription in Sanskrit of king Chandra (identified with, Chandra Gupta II, 5th cen. A.D.) has stood the weathering effect for centuries without showing any sign of rust or corrosion. It testifies to the high quality of wrought iron produced in this country.

Until the close of the 18th century the indigenous iron industry flourished throughout India except in the alluvial plains. Iron was manufactured in local iron smelting furnaces, built of sun-dried bricks plastered with a mixture of earth and cowdung. The capacity of such a furnace in Alwar (Rajasthan) was 250 kg. of iron ore and 210 kg. of charcoal. The yield of iron from one charge varied from 120 to 130 kg. Cadell wrote in 1873 that there were thirty such iron smelting furnaces at work in former Alwar State and they produced nearly 540 tonnes of iron per year. The indigenous industry could not compete with imported iron and steel and eventually died.

**Modern Trends:** The production of iron on a large scale could not be attained till the beginning of this century, though numerous attempts were made to graft European methods on the local process and to smelt iron ores. The establishment of the Tata Iron & Steel Co. Ltd. (T.I.S. CO.) and the commissioning of the blast furnaces in 1911 and 1912 at Jamshedpur, the inauguration of the Indian Iron & Steel Co. (I.I.S. CO.) furnaces at Burnpur near Asansol in 1922, the completion of the then Mysore Government scheme of manufacturing iron by charcoal at Bhadravati in 1933, and the amalgamation of the Bengal Iron Co. Ltd., with works at Kulti near Asansol and the Indian Iron & Steel Co. in 1936, are important landmarks in the history of iron and steel production in India.

These units, however, did not expand appreciably till independence and the formulation of Five-Year Plans. Apart from the modernization and expansion of the existing steel plants, and doubling of their capacities, three new steel plants at Rourkela, Bhilai and Durgapur were set up in the public sector during Second Plan period. Another steel plant has been constructed at Bokaro in addition to the expansion of the existing public sector units. A capacity target of 10.2 million tonnes of mild steel ingots, 1.5 million tonnes of pig iron and 20,000 tonnes of alloy tool and special steel has been fixed. The requirement for iron ore for the above production targets will be of the order of 20 million tonnes. The output of iron ore was 13.36 million tonnes and 14.92 million tonnes in 1962 and 1963 respectively. Although the Bokaro Steel Plant which was programmed to go into commission during the Third Five Year Plan could not materialize, and the target production of 10.2 million tonnes of steel ingots could not be achieved, yet the production of iron ore reached a figure of 20.065 million tonnes; Goa produced 6.718 million tonnes of

iron ore. It is expected that by the end of 1975, the domestic demand for finished steel and pig iron will be of the order of 8 million tonnes and 2 million tonnes respectively. It has, therefore, been programmed to step up the production of Bhilai steel plant from 2.5 million tonnes to 3.2 million tonnes and complete the first stage of Bokaro for an output of 1.7 million tonnes. In the private sector I.I.S.C.O. is expected to increase its production from 1.0 million tonnes to 1.3 million tonnes. Exports have been envisaged at a level of 1 million tonnes of finished steel and 1.5 million tonnes of pig iron. On the basis of this expansion programme, the capacity of 12 million tonnes of ingot will be reached. **Resources of Iron Ore:** The world resources of iron ore are estimated at about 83,000 million tonnes. Actually the resources may be higher in view of the fact that data for U.S.S.R. are meagre, and no substantial work for the estimation of reserves has been done in the under-developed countries.

The reserves of iron ore in India are estimated at 21,000 million tonnes and it falls under three categories — hematite, magnetite and limonite. Detailed exploration undertaken during the Second Plan period on a few deposits has revealed that earlier estimates have been highly conservative. In view of this, the reserve figures indicated above may shoot up, if detailed exploration is carried out of the deposits for reliable assessment.

Extensive deposits of hematite ore occur in the Singhbhum district of Bihar; Keonjhar, Mayurbhanj and Sundergarh districts of Orissa; Drug, Bastar and Jabalpur districts of Madhya Pradesh; Ramagiri and Chanda districts of Maharashtra; Hyderabad and Kurnool districts of Andhra Pradesh; Jaipur, Jhunjhunu and Sikar districts of Rajasthan; Mysore, Bellary and Dharwar districts of Karnataka and Mohindergarh district of Haryana.

The Indian ores are generally of high grade containing more than 60 per cent iron. The ores of Singhbhum-Keonjhar-Bonai area and Bailadila and Rawghat areas are mostly of very high grade containing on an average more than 65 per cent iron. Redi and Shimoga-Chitaldrug—Tumkur areas, though contain some high grade ore, the proportion of low grade ore is more. Dharwar and Narnaul (Haryana) produce ores of still poorer quality, iron content being 45 to 60 per cent. The poorest ore is from Tamil Nadu (Salem) containing 35 to 45 per cent iron contents. The ore of Rajasthan contains high percentage of iron but it also contains certain proportion of magnetite. The percentage of phosphorus is usually less than 0.77 per cent in most of the areas, though in some cases it goes upto 0.1 per cent or even more. The ores of Haryana (Narnaul) especially contain higher percentage of phosphorous going upto 0.43 sometimes.

The Indian ores are also usually low in sulphur content, being less than 0.03 per cent, though in a few cases it goes upto 0.05 per cent. Only

certain ores of Karnataka and Haryana contain sulphur upto 0.24 per cent. Similarly, silica percentage is usually within 4 per cent, being less than 1.5 per cent in Bihar-Orissa ores. Silica is higher in the Dharwar and Bellary regions of Karnataka and the Narnaul region of Haryana.

Important magnetite deposits have been located in the Guntur and Nellore districts of Andhra Pradesh; Salem and Tiruchirappalli districts of Tamil Nadu; Mandi district of Himachal Pradesh; Shimoga, Hasan and Bangalore districts of Karnataka and Palamau district of Bihar. Of all the magnetite deposits in the country, the Palamau deposits of Bihar are of high grade.

There are good deposits of titaniferous magnetite containing appreciable amount of vanadium in Karnataka, Tamil Nadu, and parts of Singhbhum district of Bihar and Mayurbhanj district of Orissa. The presence of titanium renders the ore unfit for normal steel making except for making special types of titanium steel. Limonite or spathic iron ores are found in the barren measures of lower Gondawana in West Bengal.

Nature has endowed India with the richest deposits of iron ore, production of which has risen from 3.6 million tonnes in 1951 to 4.8 million tonnes in 1956, 10.6 million tonnes in 1960, 28.6 million tonnes in 1969, and to 30.78 million tonnes in 1970. The increase has been due to heavy internal and external demands. Commensurate with the anticipated tempo of industrial development and export trade, the production of 54 million tonnes of iron ore is envisaged to increase to 54 million tonnes, out of which, 22 million tonnes will meet domestic demands and the rest will be exported.

**Export Trade:** The export of iron ore has received considerable impetus during the last decade. The export of ore which was only 197,005 tonnes in 1951 increased to 1.98 million tonnes in 1956, to 3.2 million tonnes valued at 17 crores of rupees in 1960, 3,390,000 tonnes in 1962 and 7,914,000 tonnes in 1963 (including exports from Goa since April 1963) valued at Rs. 31.5 crores, 15 million tonnes valued at Rs. 87.5 crores in 1969 and 21.23 million tonnes in 1970 and thereby earned foreign exchange amounting to Rs. 118.72 crores.

Japan, the East European and the West European countries are having ambitious programmes of steel expansion. They are turning to India for the supply of ore. The export trade of iron ore is handled by M.M.T.C.

**Development Trends:** To meet the increased external and internal demands, the general development trend is to establish large mines and to mechanize them.

The National Mineral Development Corporation has developed an open cast mine at Kiriburu, where the Indian Bureau of Mines had proved iron ore reserves, for annual production of two million tonnes of iron ore for export to Japan through the Visakhapatnam port. This

mine has been mechanized right from the mine face to the rail-head loading point. The Table below shows the pattern of development and mine mechanization in some of important iron ore mines.

| <i>Name of Mine</i> | <i>Location</i> | <i>Owner</i>              | <i>Remarks</i>                                                                                                                                                                                                                               |
|---------------------|-----------------|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Noamundi            | Bihar           | T.I.S.CO.                 | At present 50% of the production is realized from mechanized mining. This mine will give 6,000 tonnes of production per day after complete mechanization. This mine has been further developed for an annual production of 2 million tonnes. |
| Rajhara             | Madhya Pradesh  | Hindustan Steel Ltd.      | The mine is being completely mechanized to produce 7,000 tonnes ore per day.                                                                                                                                                                 |
| Kemmangundi         | Karnataka       | Mysore Iron & Steel Works | Feeding Mysore Iron and Steel Works.                                                                                                                                                                                                         |
| Barsus              | Orissa          | Hindustan Steel Ltd.      | Being mechanized to produce 3 million tonnes of iron ore for Rourkela Steel Plant.                                                                                                                                                           |
| Kiriburu            | Orissa          | N.M.D.C.                  | This mine will produce nearly 2 million tonnes of ore for export to Japan.                                                                                                                                                                   |
| Bolani              | Orissa          | Bolani Iron Ore Pvt. Ltd. | Will be meeting the requirements of Durgapur Steel Plant.                                                                                                                                                                                    |
| Bailadila           | Madhya Pradesh  | N.M.D.C.                  | Planned to produce 4 to 6 million tonnes of ore for export to Japan from 1966. The mine will be fully mechanized.                                                                                                                            |

The supply of iron ore to Japan from Kiriburu at the rate of 2 million tonnes per annum started from 1966. It is proposed to increase the current capacity of 2 million tonnes to a level of 4.5 million tonnes during the Fourth Plan. The prospecting of deposits No. 10, 5 and 14 at Bailadila has been completed and a project report to mine 4 million tonnes from this area has been prepared by N.M.D.C. The Bailadila project has commenced supplying ore to Japan. The Kiriburu ore will consequently be diverted to the Bokaro plant after its construction. The export commitment of Kiriburu will then be transferred to Bailadila. The N.M.D.C. is expected to contribute about 14 million tonnes out of the target of 51 million tonnes of iron ore for the Fourth Plan period. The Mysore Board of Mineral Development proposes to raise about a million tonne of ore from the Bellary-Hospet area for export through Mangalore port. The incidence of a good quantity of high and low grade ores in that area provides prospects of even exporting low grade ore in which some of the European countries are interested.

**Beneficiation Trends:** In iron ore mining, about 30 per cent of total produc-

tion may go as rejects. This means that on an average about 10 million tonnes of iron ore fines would be produced every year, for mining 32 million tonnes of iron ore. This calls for the beneficiation of iron ore rejects by pelletizing, modulizing and sintering. Apart from this aspect, the high limit of 65% iron in the specifications, imposed by the foreign markets, necessitates beneficiation of iron ore to a certain extent. The common impurities in iron ore are silica and alumina which have to be eliminated to meet the blast furnace requirements. The Tata Iron and Steel Co. has installed a washing plant at Noamundi in Bihar to reduce the alumina content. The Company has also installed a sintering plant for treating iron ore fines. The sintered products would be more uniform as regards the composition and size. More sintering plants will come into being when the increased mining of iron ore begins. Hindustan Steel has already set up sintering plants at Rourkela and Bhilai. Almost all the steel plants in India have sintering plants. Their total capacity is about 5 million tonnes. There is only one pelletization plant in the country located in Goa with a capacity of 0.6 million tonnes.

T.I.S.CO. is setting up a pelletization plant at Noamundi with one million tonne capacity to start with; it will utilize iron ore fines and blue dust produced at Noamundi mine.

#### IV. Petroleum In India

During the present jet and supersonic age the importance of petroleum to a country cannot be over emphasized. It is indispensable to meet the requirements of energy and power needed for defence equipment. India does not appear to have plentiful resources of oil although the search for petroleum in India is almost as old as in most of the advanced countries. The first bore hole drilled for oil in India was in November 1866, by a Calcutta firm at Nohar Pung near Burhi Dhing river in Upper Assam; but it was not until 1889 when Mr. Willie Leova Lake struck oil at depth of 201.68 metres in his very first hole at Makum near Margherita. By 1899, 14 wells were drilled north of Makum in the Digboi area which led to the formation of the Assam Oil Co (A.O.C.) This company maintained its existence for over 20 years during which 80 wells ranging in depth to 609.6 metres were drilled. In January 1921, the Burmah Oil Company took over the management of the A.O.C. providing it much needed financial assistance, technical know-how and refining facilities. In about ten years, production was raised from 70,000 litres a day to 9,00,000 litres. A total of 998 wells had been drilled upto the end of 1962, out of which 400 wells are still producing. The deepest well in this field is No. 898 which has gone down to 2,786 metres. The Digboi oil-field is showing signs of exhaustion and there is no further exploration.

Since 1906, this field has produced nearly 10 million tonnes of crude oil; the production during 1962 was 182,667 tonnes. Till 1954, the Assam Oil Co. was the only concern in India producing oil. With the separation of Burma from India in 1937, India's deficiency in petroleum became apparent and following the partition in 1947, the oil-fields of Potwar went to Pakistan. India was left with the aging Digboi oil-fields whose reserves were gradually depleting.

**Origin of Petroleum:** It is generally accepted that the formation of oil has taken place due to decay of low forms of animals and plants in the marine sedimentary formations especially clay or mud. Sediments of recent ages *viz.*, tertiary formations are considered more favourable for preservation of petroleum than other older sediments which are more tectonically disturbed and have gone under several geological strains and stresses.

The water, oil or gas accumulated in clayey beds during the course of compression have moved upward into the porous rocks such as sandstone, limestone, etc., which are called reservoir rocks. In the reservoir rocks, the oil or gas tends to move upward till some obstruction is met due to some change in lithology or faulting. Anticlinal folds or domes are the most suitable homes for oil accumulation. Within these reservoirs, accumulation is governed by the buoyancy of the fluids, the lighter ones moving upward, the heavier ones gravitating to the lower levels. Thus, generally in all oil wells, water is found at the bottom, oil in the middle, and gas at the top.

In India, nearly 10,36,000 sq. km. are covered by marine sediments of recent origin besides off-shore coastal tracts which can be called the potential home of petroleum. This has to be proved by intensive geological, geophysical surveys and by wild cat drilling. The recent surveys have shown that suitable oil reservoirs exist at a depth of over 3,000 m. in the Assam valley. To find oil at such great depths requires a great deal of surface work in deciphering the geological structures suitable for accumulation of oil.

**Setting up of Oil and Natural Gas Commission:** A delegation headed by the then Minister for Mines and Fuel, K. D. Malviya, visited in 1955, oil fields in the U.S.S.R., Netherlands and Rumania to study the organizational methods and techniques in oil exploration, exploitation and oil refining. Oil industry being capital intensive, its operations are complicated and in this respect it is different from a normal industrial organization in India or abroad. It was with this background and also with a view to intensifying the search for mineral oil, that the delegation recommended to the Government of India the establishment of a separate commission for exploration of oil in India. A separate department for the explora-

tion of oil and natural gas was established in 1955, with headquarters at Dehradun. In 1958, it became a Commission and then an autonomous body.

**Discovery of Oil in Gujarat:** Three oil structures have been discovered by the Commission in the Lunej (Cambay) area, Hazat (Ankleshwar) and Sertha (Kalol) in 1958, 1959 and 1961 respectively.

The Lunej structure initially located by geophysical investigations in Cambay is approximately 20.7 sq. km. in extent. The first site for drilling was selected in the south-western area. After necessary preparations drilling operations started in 1958 with a Russian Ural-mash — 3 D turbo drill. The well was drilled to a depth of 2,191 metres in 91 days. In the course of drilling, several horizons of oil and gas sands were encountered at varying depths, between 1,310 and 1,710 metres. The oil was accompanied by gas under high pressure. In the second well which was drilled about one and a half kilometre to the east, the presence of oil and gas was confined in various horizons at and below 1,500 metres. The seismic work has shown that the total area of the Cambay field, is about 53 sq. km.

Attention was next directed to a larger structure covering more than 32 sq. km. near a gas show nearly 134 kilometres south of Cambay at Ankleshwar. The first well was spudded in 1959 and drilled to a depth of 1,960 metres. Oil and gas shows were observed in May during production testing.

In 1960, survey was begun of the Kalol area, some 24 km. north of Ahmadabad. Kalol well No. 1 was drilled by an Indian team assisted by Soviet experts. The well reached a depth of 1,800 metres. A perforation test was carried out in June 1961, and oil flowed freely from the well.

The total number of deep wells drilled till the end of 1962 in Gujarat is given below:

| Area                               | Oil       | Gas       | Dry       | On test   | Completed | Under Drilling | Total      | Metres Drilled |
|------------------------------------|-----------|-----------|-----------|-----------|-----------|----------------|------------|----------------|
| (1) Ahmadabad                      | 3         | —         | —         | 2         | 3         | 1              | 6          | 9,515          |
| a) Kalol                           | —         | —         | —         | 1         | 1         | —              | 1          | 1,850          |
| b) Sanand                          | —         | —         | —         | 2         | 2         | —              | 2          | 3,847          |
| c) Wavel                           | —         | —         | —         | —         | —         | —              | —          | —              |
| (2) Ankleshwar (including Kosamba) | 50        | —         | 4         | 2         | 56        | 3              | 59         | 80,522         |
| (3) Cambay                         | 3         | 14        | 9         | 6         | 32        | —              | 32         | 66,504         |
| (4) Oilpad                         | —         | —         | —         | 1         | 1         | —              | 1          | 2,054          |
| <b>Total Gujarat</b>               | <b>56</b> | <b>14</b> | <b>13</b> | <b>14</b> | <b>95</b> | <b>4</b>       | <b>101</b> | <b>164,292</b> |

The Oil and Natural Gas Commission (O.N.G.C.) has drilled 200 wells in

Ankleshwar oil-field upto 1969; of these 170 are oil producing, 12 gas producing and the rest are dry.

Firm estimates of oil reserves in the oil-fields of Gujarat which have been drilled by O.N.G.C. have now been made upto the end of 1966. The estimated reserves in the three fields are 68.80 million tonnes which are sufficient to feed a 3-million tonne refinery set up at Koyali near Baroda. The reserves of natural gas are estimated at 67.25 thousand million cubic metres.

The commercial production of oil from the Ankleshwar field started in 1962 and has now attained an annual rate of production of 7,30,000 tonnes. The crude goes by rail to the Bombay refineries, but when the Koyali refinery is completed, it is expected to raise the production to 2 million tonnes to feed that refinery. The production was stepped up to 9,500 tonnes per day in 1968-69 and to 10,000 tonnes per day in 1969-70.

By the end of March 1970, the Commission had produced and despatched a total of 15.13 million tonnes of crude oil from the oil-field of Gujarat. Of this 4.9 million tonnes were supplied to Burmah Shell and Esso Refineries in Bombay and 10.23 million tonnes were supplied to Indian Oil Corporation (I.O.C.) Refinery at Koyali in Gujarat. The Commission at present supplies the entire demand of crude oil of Koyali Refinery in Gujarat. The Commission during 1969-70 produced and sold 3.64 million tonnes of crude, 3.45 million tonnes from Gujarat and 0.19 million tonnes from its fields in Assam, and sold also 333.1 million cubic metres of gas, valued at Rs. 38.58 crores as against 34.80 crores in the previous year.

**Exploration for Oil by O.N.G.C.:** Detailed deep drilling exploration had been started in 1958 in several areas in Punjab viz. Adampur, Hoshiarpur, Janauri and Jawalamukhi. Oil has not so far been struck in any well; only gas came out from one well.

Further exploratory drilling in Punjab is in progress. The O.N.G.C. has entered into an agreement with the French Petroleum Institute for oil exploration in the Jaisalmer area of Rajasthan.

Besides these, detailed geological and geophysical surveys are being carried out in the Kaveri basin in Tamil Nadu, Uttar Pradesh., Bihar, Punjab, West Bengal, etc.

During the Third Plan, about Rs. 202 crores were provided for oil exploration and development by the Oil and Natural Gas Commission; greater emphasis was laid on oil exploration and production.

The O.N.G.C. organized, on an average, 14 geological parties, 11 gravity cum magnetic parties and 20 seismic parties and 8 electro-logging parties to intensify their search for oil in area where sedimentary rocks are suspected to occur below the surface. Extensive geological mapping, line-traversing and reconnaissance were carried out in alluvial

areas of Jammu and Kashmir, Punjab, Himachal Pradesh, Uttar Pradesh, West Bengal, Assam, Orissa, Madhya Pradesh, Rajasthan, Gujarat, Tamil Nadu and the Andaman Islands.

Gravity and magnetic work was carried in almost all the alluvial regions of the country where sedimentary were suspected to be covered with soil. Several thousand Gravity and Magnetic (G.M.) stations were measured.

Seismic work was carried out in Andhra Pradesh, Assam, Bihar, Gujarat, Rajasthan, Uttar Pradesh, West Bengal, Tamil Nadu and Jammu and Kashmir. One seismic party operated in the area of Gujarat. Exploratory and deep drilling was carried out where structures were found favourable for oil. By the end of 1966, the O.N.G.C. had completed 458 oil wells of which 237 were oil bearing, 40 gas bearing, 94 dry, 18 water injection wells and 69 were under test.

Out of 458 wells, 392 were drilled in Gujarat, 47 in Assam (Rudrasagar area), 7 in Punjab, 3 in Uttar Pradesh, 2 in Bihar, 4 in Rajasthan and 3 in Pondicherry.

During the Third Plan O.N.G.C. estimated the reserves of oil in Gujarat and their area in Assam.

**Discovery of Oil at Rudrasagar and Sibsagar, Assam:** Exploratory drilling operation was started at Rudrasagar and Sibsagar in 1961 where a favourable structure had earlier been established by Seismic Survey. Oil flowed freely from the first well. Out of five wells drilled, four at Rudrasagar encountered oil, while one near Sibsagar was dry. The production from this oil-field started in 1966 when 0.02 million tonnes of crude was produced. The O.N.G.C. produced 0.15 million tonnes of crude oil in 1968-69 and 0.19 million tonnes in 1969-70. The crude produced from this field was supplied to Gauhati and Barauni Refineries of I.O.C.

**Exploration of Oil in West Bengal — Indo-Stanvac Petroleum Project:** After an aeromagnetic and grounds survey by the Standard-Vacuum Oil Company, in collaboration with the Government of India, a drilling programme was initiated in 1953. After drilling ten test wells (all dry) the project was abandoned.

**Discovery of Nahorkatiya Field—Birth of Oil India Ltd:** The geophysical work in upper Assam was undertaken by the Assam Oil Company as early as 1925. Seismic work was carried out later, which confirmed that Barail rocks at a depth of about 3,048 metres from which oil is supposed to have migrated into higher Tipam sands in Digboi are also oil bearing in Nahorkatiya and Hugrijan areas. Drilling followed and the first oil producing well was completed in 1953. Oil was found in several sand beds between 2,865 to 3,108 metres. At Moram, about 32 km. further west of Nahorkatiya, the first test well was successfully completed in 1956 and the existence of oil was proved in the same rock formations.

Further extensive drilling in the Nahorkatiya-Hugrijan area where 30 wells were completed by the end of 1957, proved this potential oil-field.

The discovery led to the formation of Oil India Limited (a rupee company) in 1958, on a 50-50 partnership basis between the Government of India and the Assam Oil Company. Taking into consideration the development of the oil-fields, Oil India Limited was entrusted with the job of constructing 1,160 km. long pipeline for carrying crude from these fields to public sector refineries located at Noonmati in Assam and Barauni in Bihar.

Oil India has also acquired the rights to explore an area of 4,947 sq. km. in the north-east of Assam. Till March 1968, Oil India had completed 160 wells in the Nahorkatiya and Moram areas out of which 106 were oil bearing, 8 gas bearing and 16 had proved dry while the rest were awaiting further testing.

**Laying of the Pipe Line:** The problem of transporting crude oil to a distance of 403 km. from Nahorkatiya to the Noonmati refinery in Gauhati, Assam and to the Barauni refinery in Monghyr, Bihar, a distance of 1,160 km. from Nahorkatiya, crossing many rivers on the way, was completed in February 1962. Crude is supplied to Digboi and the Noonmati refinery, and it will feed the Barauni refinery when it goes into operation. The production will, then, be stepped up to 3 million tonnes of crude a year.

**Refineries:** There are in all five refineries in production at present, out of which four (2 in Bombay and one each in Vishakhapatnam and Digboi) are in private sector. The fifth refinery at Noonmati in Assam, is the first one in the public sector. The sixth refinery at Barauni on the northern bank of the Ganga in Bihar will go into production shortly. The Government of India has constituted a separate organization 'Indian Refineries' to run these public sector refineries. Another refinery is coming up at Koyali in Gujarat; but this is likely to be looked after by the O.N.G.C. The refinery at Noonmati has been constructed by the Rumanian Government and the Barauni and Koyali plants are being put up with Russian assistance. The three public sector refineries will have a total capacity of 4.5 million tonnes which will be expanded to 7 million tonnes, Gauhati to one million and Barauni and Koyali to 3 million tonnes each.

The Government of India in May 1963, concluded an agreement with the Phillips Petroleum Company of America to set up a refinery in Cochin with a capacity of 2.5 million tonnes. The plant is likely to cost Rs. 35 crores. It will be jointly owned by the Government of India and Phillips Co. It will be located at Ambalamukal on the eastern bank of Chitrapurha river, 16 km. from Cochin port.

Details of the refineries with their present and envisaged capacities are tabulated on next page:

| <i>Company</i>    | <i>Location</i> | <i>Cost<br/>Rs.<br/>(crores)</i> | <i>Year<br/>of<br/>Estt.</i> | <i>Capacity in<br/>million tonnes<br/>during 1962</i> | <i>Envisaged<br/>expansion<br/>capacity</i> |

| Phillips          | Cochin          | 35                               | 1965—66                      | 2.50                                                  | —                                           |

All public sector refineries are to meet the supply of crude oil from the newly opened oil-fields in Assam and Gujarat.

The Government of India have set up another agency, Indian Oil Ltd., for distribution of petrol and petroleum products produced from refineries in the public sector and also to import and market deficit kerosene and middle distillates. This company was formed in 1959, with an authorized capital of Rs. 12 crores. It has already entered into a contract with an export organization of the U.S.S.R. for the import of 1.9 million tonnes of products mainly kerosene and high speed diesel.

**Oil in India's Economy:** The per capita consumption of petroleum in India during 1962 worked out to 18 litres per annum, as against 3,000 litres in U.S.A., 730 litres in U.K. and 238 litres in Japan. The production from indigenous sources (Digboi, Nahorkatiya, Ankleshwar) contributed only 13 per cent to the total requirements in the country during 1962. Even on the basis of 100 litres per capita consumption, 50 million tonnes crude oil per annum will have to be produced. It is essential, therefore, to intensify exploration in a number of potential areas to meet the widening shortage. At present India is importing the bulk of her petroleum and petroleum products. The potentialities of newly discovered fields so far known are capable of producing about 6 to 7 million tonnes annually which is hardly sufficient to meet even the 40 per cent of her total requirements. Recently oil has been struck during off-shore drilling at Bombay High. The indications are promising although it is too early to predict its potentialities.

**Other Oil Possibilities in India:** It is now well established that marine sediments of Eocene to Upper Miocene age are the source rock of petroleum. In the newly discovered fields in the Gulf of Cambay, Ankleshwar and Kalol, the oil bearing beds are of Eocene age.

There seem to be two distinct possibilities of oil belts in India, the one running from the Potwar Plateau (Attock oil-fields) through Punjab, Uttar Pradesh, Bihar, Bengal, Assam and veering round to Burma, and

the other belt from the Sui Oil Gas belt (in Pakistan) through the Gulf of Kutch to the Gulf of Cambay. As a matter of fact, almost all the areas in the western and eastern coasts where marine transgression has taken place in post Cretaceous age should be searched for petroleum. Such areas are north of Goa on the West Coast, Kerala, Tiruchirappalli and Thanjavur in Cauvery basin in Tamil Nadu, the Pondicherry area, the Godavari delta in Andhra Pradesh and the Orissa coast and the Andaman and Nicobar Islands.

Recently, a geophysical survey conducted in North Bihar with West German collaboration has revealed interesting results, which are now to be confirmed by deep drilling. The entire area consisting of Jaisalmer, Bikaner and Ganganagar in Rajasthan, areas between the Sutlej and Beas rivers in the Punjab and the foot-hills of the Himalayas in Uttar Pradesh, Bihar and the alluvial basin of West Bengal deserve thorough investigation. The O.N.G.C. has entered into an agreement with the French Petroleum Institute for oil exploration in the Jaisalmer area.

An institute of Petroleum Technology has been established in Dehra Dun, which will help solving many problems concerning oil technology.

### V. Other Minerals

**Antimony:** A few occurrences of stibnite (Antimony Sulphide) are known and the most important one is that of Bara Shigri glacier in Lahaul area, Himachal Pradesh. The deposit was leased to a private party at one time. The G.S.I. carried out investigations for stibnite (antimony ore) by detailed mapping and drilling in the Chamboli district of Uttar Pradesh. They drilled 111.78 metres and collected 9,682 tonnes of stellerite. Exploration has been temporarily suspended since December 1966. The Star Metal Refinery Ltd., with its plant at Vikhroli, Bombay, is the only producer of antimony metal from imported antimony ore from Bolivia, Thailand and Australia. The annual requirement of antimony metal which is mainly consumed in the manufacture of antifrication metal, printing and type metal and storage battery plates, etc., is of the order of 850 tonnes. Antimony Trisulphide ( $Sb_2S_3$ ) is used in the manufacture of safety matches, in cartridge percussion caps and for producing dense white fumes in military manoeuvres. Antimony Penta Sulphide ( $Sb_2S_5$ ) is used in the manufacture of paints and in vulcanizing rubber. There is no indigenous production. The plant at Vikhroli produces antimony metal from imported Antimony Sulphide ore after beneficiation and smelting. The installed capacity is 1,000 tonnes per annum which is sufficient to meet the country's requirements.

The quantity of antimony metal produced from the imported Antimony Sulphide ore during 1960-1970 is given below:

| <i>Year</i>                                 | 1960  | 1966  | 1967  | 1968  | 1969  | 1970 |
|---------------------------------------------|-------|-------|-------|-------|-------|------|
| Import of Antimony Sulphide ore (in tonnes) | 1,214 | 2,110 | 1,528 | 1,733 | 1,636 | 699  |
| Production of antimony metal (in tonnes)    | 821   | 854   | 901   | 812   | 637   | 526  |

**Apatite and Phosphate Rocks:** Apatite is used in the manufacture of high phosphorous pig iron. Apatite and other phosphates are the chief raw materials for the manufacture of superphosphates. Apatite mines are worked in Singhbhum (Bihar) near Ghatsila. In the Kasipatnam area of Andhra Pradesh, apatite occurs in thin veins. Only one mine is working in this State while three mines are working in Singhbhum (Bihar). Small quantities of phosphate nodules are also produced sometimes from Tiruchirapalli, Tamil Nadu. All apatite mines are worked manually by open cast mining at Ghatsila mine in Singhbhum district. Apatite occurs in lenses and each lense is worked as a separate quarry. In 1966, a new mine at Kasipatnam was opened by the Fertilizer Corporation of India. The indigenous production is hardly 10% of the requirements, which have to be met through imports from Jordan, Tunisia, Morocco and Egypt. In 1962 production was 29,018 tonnes while imports were 287,609 tonnes. The production in 1963 declined and was only 13,127 tonnes. The production in the years 1966-70 was as below:

| <i>Production</i> | 1966   | 1967   | 1968  | 1969  | 1970   | <i>Year</i>   |
|-------------------|--------|--------|-------|-------|--------|---------------|
|                   | 16,275 | 11,631 | 6,695 | 9,316 | 15,768 | <i>Tonnes</i> |

**Asbestos:** Deposits of asbestos are worked in Andhra Pradesh, Bihar, Karnataka and Rajasthan. Except asbestos produced from Pulivendla a taluk of Cuddapah, Andhra Pradesh, which is of a very high chrysotile variety, others are of tremolite variety which has lower tensile strength and is brittle.

Asbestos is used in the manufacture of asbestos cement sheets, fire proof cloth, mineral filler, boiler lagging, etc. India imports large quantity of asbestos to meet her requirements. During 1962, 22,376 tonnes of raw asbestos valued at Rs. 23.33 million was imported from Canada and Rhodesia. Indigenous production reached the peak of 2,712 tonnes in 1963. The production of asbestos was only 82 tonnes in 1948, 719 tonnes in 1953, and 1,181 tonnes in 1958. Asbestos mines in Pulivendla are worked by inclined adits and long wall fill back system. There is one underground mine in Rajasthan which is worked by board and

and pillar system. All the other mines are worked by the open cast method and are manually worked. The details of production and imports between 1966-70 are as below:

| <i>Production</i> | 1966  | 1967  | 1968   | 1969   | 1970   | <i>Year</i>   |
|-------------------|-------|-------|--------|--------|--------|---------------|
|                   | 6,979 | 7,014 | 9,073  | 9,550  | 9,834  | <i>Tonnes</i> |
| <i>Imports</i>    | —     | —     | 25,924 | 33,609 | 39,766 | <i>Tonnes</i> |

In some cases pneumatic rock drills are employed for drilling. A few mine owners sort out the fibre and wash the material while others adopt crushing to powder the material.

By the end of Fourth Plan 1973-74 the demand for asbestos is estimated to be of the order of 80,000 tonnes whereas the indigenous production was expected to reach 12,000 tonnes. Rajasthan is the leading producer. The balance had to be met by imports. During 1970, 39,766 tonnes of asbestos valued at Rs. 71.25 million was imported as against 33,609 tonnes valued at Rs. 56.5 million in 1969. Imports are canalized through S.T.C.

**Barytes:** The Sulphate of Barium also known as heavy spar occurs in veins and fissure veins. Cuddapah, Anantapur and Kurnool districts of Andhra Pradesh and Alwar district of Rajasthan are the important mining centres of barytes. It is also mined in Bihar near Ranchi. In India, barytes is mainly used in the manufacture of paint (Lithophone) and as filler in paper, textile and linoleum industries. Off-colour barytes is used in drilling mud. Barytes is used in the manufacture of barium chemicals.

A total of 37,312 tonnes of barytes was produced and 9,193 tonnes valued at Rs 817,000 was exported during 1963. It is expected that the domestic requirements of barytes by 1975 will be of the order of 75,000 tonnes. The production of barytes in 1969 was 58,722 tonnes which rose to 71,923 tonnes. This shows that production is likely to keep with the demand.

**Bauxite:** Deposits of bauxite in India are usually found as capping on flat hill tops. Good deposits are found in Ranchi and Palaman districts of Bihar; Sarguja, Raigarh, Jabalpur, Shahdol, Bilaspur, Durg, Balaghat and Mandla districts of Madhya Pradesh; Kolhapur and Kolaba districts in Maharashtra; Belgaum in Karnataka; Salem in Tamil Nadu; Sambalpur and Koraput in Orissa and Saurashtra in Gujarat. Chemical grade having ferric oxide less than 2% and alumina contents 60% is limited to the coastal tracts of Gujarat.

Bauxite is the ore of aluminium metal; it is also used in the manufacture of refractories and abrasives for refining kerosene and lubricating oils, for the manufacture of alum and in the cement industry.

During 1966 four companies were producing aluminium metal. Indian Aluminium Co. Ltd., Aluminium Corporation of India Ltd.,

Hindustan Aluminium Corporation Ltd., and Madras Aluminium Company have installed capacities of 36,170 tonnes, 7,500 tonnes, 40,000 tonnes and 10,000 tonnes respectively. The Indian aluminium industry consumed 155,108 tonnes of bauxite during 1962 and manufactured 53,004 tonnes of alumina, besides 17,607 tonnes of alumina was imported to produce 35,209 tonnes of aluminium ingots. The licensed capacity of aluminium metal during the Third Five Year Plan had been revised to 150,000 tonnes. During 1966 the production of bauxite was 749,948 tonnes against 706,649 tonnes in 1965, while in 1969 and 1970, 1,085,000 tonnes and 1,360,000 tonnes were produced respectively.

There has been a considerable upward trend in the production of bauxite during the years 1965-70, due to rapid expansion of the aluminium industry in India and the increased overseas demand as indicated below:

| <i>Year</i>                             | 1965    | 1966    | 1967    | 1968    | 1969      | 1970      |
|-----------------------------------------|---------|---------|---------|---------|-----------|-----------|
| Output of bauxite in tonnes             | 706,649 | 749,948 | 789,000 | 939,000 | 1,085,000 | 1,360,000 |
| Production of aluminium metal in tonnes | 68,968  | 83,759  | 96,223  | 120,000 | 132,577   | 161,381   |

Japan, Italy, West Germany and Australia are the principal buyers of Indian bauxite.

Although the production of aluminium ore and aluminium metal has substantially increased during the recent years, still the output of aluminium is far below the increasing requirements, which are met by imports. During 1969, 2,091 tonnes of aluminium metal had to be imported at a cost of Rs. 1.27 crores. The foreign exchange earned during the same period by exporting bauxite was Rs. 33.5 lakhs. The rapid increase in the requirements of aluminium is due to its substitution for copper and zinc particularly in electric cables and wires.

The production of aluminium is expected to be stepped up to 220,000 tonnes by 1973-74. Establishment of two smelters with alumina production facilities at Korba and Kona are under constructions. In view of substantial deposits of good grade bauxite occurring in Kutch and Saurashtra an export oriented alumina plant has been proposed in the area.

**Chromite:** The important deposits of chromite are located in the Singhbhum district of Bihar, Keonjhar and Cuttack districts of Orissa, Hasan and Mysore districts of Karnataka, and in the Bhandara and Ratnagiri districts of Maharashtra. A proper assessment of reserves has not been made but reserves at present are placed at 4.9 million tonnes. Most of the mines are worked by open cast method except Jojohatu in Singhbhum (Bihar) and Sinduali and Tallur in Karnataka which are

worked by underground mining method. Chromite is mainly consumed in the manufacture of chrome steel, stainless steel and production of chromium metal which finds extensive use in electro-plating. Due to its high resistance to corrosion and its ability to stand high temperature it finds extensive use as refractory material for lining steel furnaces. Chrome bricks or chrome magnesia bricks are manufactured for this purpose. In the chemical industry, chromite is used for the manufacture of chromates and bichrome which are required in the tanning, dyeing, ceramic, glass and other industries.

The chromite mining industry also largely depends upon export markets, although there has been some improvement in domestic consumption by the refractory and chemical industries. The bulk of the high grade chromite *i.e.* 48% and above  $\text{Cr}_2\text{O}_3$  is exported and only medium and low grade are utilized for indigenous requirements. The production of chromite in 1969 and 1970 was 226,568 tonnes and 270,879 tonnes respectively, valued at Rs. 1.20 crores and Rs. 1.44 crores respectively. During the same period 111,620 tonnes of chromite valued at Rs. 2.06 crores and 153,402 tonnes valued at Rs. 3.18 crores respectively were exported. Internal consumption by 1973-74 is expected to be of the order of 100,000 tonnes.

**Copper Ore:** The Indian Copper Corporation Ltd. mines copper ore from its mines in Mosaboni area of Singhbhum copper belt, Bihar. The Corporation is operating three mines namely Mosaboni, Surda and Patharghora. Mining in all three mines is being done by underground methods by breast stopping with pillar and timber support and scraper nucking. Rocker shovels and electric battery locos are also employed to speed up tramming. The ore is smelted at Corporation's smelter at Monbhandar near Ghatsila, with an annual production capacity of about 9,000 tonnes of fire refined copper. The Corporation has been busy in installing an electrolytic copper refinery of an annual capacity of 8400 tonnes to be initially fed by imported blister copper. The refinery has been commissioned since August 1965. The production of copper in the country is far below the demand, which is rapidly increasing due to industrial development. It hardly meets 10 per cent of the requirements. The production of copper during 1970 was 9,311 tonnes against a requirement of 85,000 tonnes. The demand for this metal is expected to go up to 124,000 tonnes by 1973-74. The Indian Copper Corporation is installing a Flash Smelter thereby increasing its production capacity from 9,960 tonnes to 16,500 tonnes by 1973-74. The requirements of copper may rise to about 300,000 tonnes in the next 10 years or so. Import of 71,730 tonnes was made at a cost of Rs. 23.77 crores during 1962. All-out efforts are being made by the Indian Bureau of Mines and the Geological Survey of India to explore the possibilities of developing new copper deposits in the country. At Khetri, the Indian

Bureau of Mines has proved about 100 million tonnes of 1% copper ore, by deep drilling and the National Mineral Development Corporation has been entrusted with the exploitation of copper deposits at Khetri and Dariba (Rajasthan).

Plans for exploitation and extraction of copper at a rate of 21,000 tonnes of electrolytic copper per annum have been prepared by Western Knapp Engineering Co., U.S.A. who are consultants to the National Mineral Development Corporation. It was decided that instead of going in for the conventional smelter as recommended by Western Knapp, Flash Smelter shall be installed, for which agreement has been signed with OUTOKUMPO of Finland. The proposed capacity of the smelter will be 31,000 tonnes per annum and is likely to go into operation in 1974-75. The Hindustan Copper Ltd. (H.C.L.) proposes to develop Rakha mines in Bihar for an anticipated copper production of 20,000 tonnes by 1978-79.

**Manganese Ore:** India is endowed with rich deposits of manganese ore. Deposits are located in the Nagpur, Bhandara and Ratnagiri districts of Maharashtra; the Panch Mahal district of Gujarat, the Balaghat and Chindwara districts of Madhya Pradesh; the Singhbhum district of Bihar; the Keonjhar, Bolangir, Sundergarh, and Koraput districts of Orissa; the Shimoga, Chikmagalur, Chitaldurg, Belgaum, North Kanara, Bellary and Tumkur districts of Karnataka, the Banswara and Udaipur districts of Rajasthan and the Srikakulam district of Andhra Pradesh.

In India, almost the entire quantity of manganese is mined by open cast method except at Balaghat, Shivrajpur and Gowardhna mines where, to work deeper horizons, underground mining has been adopted. In the Balaghat mine, square set timbering system to support weak ground has been introduced, while the fill back stoping system of mining is being carried out in Shivrajpur mines. Earth moving equipment is employed in Kandri mines of Manganese Ore India Ltd. and at Dongribusurg mine of the Central Provinces Manganese Ore Co. (C.P.M.O.) Women labour is employed in hand cobbing and dressing of manganese ore. For upgrading low grade ores, hand operated jigs are used. At Dongribusurg heavy media separation plant is being operated by C.P.M.O. for beneficiating low grade ore from old dumps.

With the setting up of new steel plants and the expansion of old steel mills and the setting up of 6 ferro-manganese plants, 160,020 tonnes of ferro-manganese was produced during 1972. The internal demand for manganese ore has increased; 497,000 tonnes of manganese ore was consumed in the country in 1962 while 698,000 tonnes was exported. The indigenous demand for manganese ore by 1973-74 was expected to be of the order of 688,800 tonnes of low grade for the production of pig iron and 181,440 tonnes of ferro-manganese for the production of ingot steel.

During the past few years the export of manganese ore has dropped

considerably. The slump in the market has been marked by a downward trend in the price. Free on Board price of 46-48% manganese ore at Calcutta port dropped from Rs. 160 per tonne in 1958 to Rs. 120 per tonne in 1962. India produced 1.226 million tonnes and 1.075 million tonnes of manganese ore during 1962 and 1963 respectively; whereas 1.629 million tonnes of manganese ore was produced during 1972 and 862,000 tonnes valued at Rs. 92.43 millions was exported.

**Mica:** India continues to hold the premier position in respect of mica in the world. Brazil is the only country which is gradually coming up. But ruby quality of block mica is nowhere produced except in India.

The chief producing centres of mica in India are the Hazaribagh, Bhagalpur, Gaya and Monghyr districts of Bihar; the Ajmer, Bhilwara, Jaipur, Tonk and Udaipur districts of Rajasthan; the Nellore district of Andhra Pradesh; the Quilon district of Kerala and the Nilgiris district of Tamil Nadu. Mica produced from Kerala is of phlogopite type while the rest is muscovite of high quality.

There has been a considerable improvement in mica mining technique and several mines have installed pumps, air compressors, pneumatic drills, mine hoist, etc. At Bandro Surangi mines of Christeen Mica Industries Ltd., winding machinery with men hoisting cage has been installed.

Mica is a good foreign exchange earner and about Rs. 10 crores worth foreign exchange is secured every year. During 1972, mica valued at Rs. 20.34 crores was exported. The internal consumption is hardly 900 tonnes a year, but it is likely to increase with the development of electrical industries, and the manufacture of heavy electrical machinery.

**Lead-Zinc:** Known occurrences of lead and zinc ores are located in the Udaipur, Jaipur and Ajmer districts of Rajasthan; Riasi in Jammu; Almora in Uttar Pradesh; and Cuddapah in Andhra Pradesh.

Zawar mine in Udaipur (Rajasthan) is the only working mine at present. The ore mined is treated at the mine. Lead concentrates containing 70-74% Pb. are transported to lead smelter at Tundu near Dhanbad, where lead and silver are recovered. Zinc concentrates containing 52-54% Zn. are exported to Japan for smelting, and zinc metal is received back in the country.

The Metal Corporation of India, a private limited company, was taken over by the Government of India from October 22, 1965, and a new public sector undertaking Hindustan Zinc Ltd. (H.Z.L.) was formed to run the mines and smelters.

The Metal Corporation of India was installing a zinc smelter at Udaipur with an initial capacity of 18,000 tonnes a year. A new shaft

is being sunk at Mochia Marga hill to develop the mine at deeper horizons, the capacity of the shaft will be 2,000 tonnes run of mine ore per day.

In 1963, 5,920 tonnes of lead concentrates and 10,627 tonnes of zinc concentrates as against 6,384 tonnes of lead concentrates and 9,837 tonnes of zinc concentrates in 1962 were produced. 4,314 and 3,991 kilograms of silver were recovered in 1962 and 1963 respectively.

Another firm Cominco Binani Ltd. was licensed in 1965 to set up a Zinc Smelter at Alwaye (Kerala) with a capacity of 20,000 tonnes of zinc from imported zinc concentrates. The smelter was commissioned in 1967 and zinc metal was produced for the first time in India. From March 1968, the production of zinc ingots started at Debbri Zinc Smelter of H.Z.L. The production of zinc in 1970 was 23,410 tonnes as against 23,051 tonnes in 1969 and 20,699 tonnes in 1968. During 1972, 25,227 tonnes zinc was produced.

**Gold:** Gold has been produced in India from prehistoric times; some of it has been panned from river beds, while the rest must have been mined, as is evidenced by ancient workings some of which extend to 60 metres. At present there are four mines all located in Karnataka namely, Hutti in Raichur district, Nandi Drug, Champion and Mysore in the Kolar Gold Fields in Kolar district. The Champion mine has gone down to over 3,000 metres, but rich gold bearing rock still persists in Glen ore shoot. Nandi Drug has enough reserves of low grade ore in the west reef while Mysore mine is almost on its last legs.

The auriferous lodes occur in a narrow strip of hornblende schist known as Kolar schist band of pre-cambrian age surrounded by gneisses and granites. Gold occurs in quartz veins or reefs in the field. This field had been worked since 1880 by John Taylor and Sons, a London firm of mining engineers.

Mines in the Kolar Gold Fields (K.G.F.) are very extensive and have the distinction of being among the deepest mines in the world. The total length of drives, cross cuts and levels driven underground is over 1,040 km. Thus mining methods are most intricate. The choice of a particular method depends on the nature of the ore body, the rock pressure and temperature at various depths and the degree and nature of support required to control ground movements.

The following types of stoping are practised in K.G.F. depending on ore body and the local mining conditions:

(1) Chatty stoping; (2) Ordinary underhand bottom stoping; (3) Cup stoping; (4) Sink stoping; (5) Flat back stoping; (6) Stepped back or staggered back stoping ; and (7) Rill stoping.

There is the problem of rock bursts and high temperatures in these mines. Normal rock temperature at 3048 metres is 65°C. Thus preconditioned air at 3.3°C is forced underground. Auxiliary air condi-

tioning plants are also installed to work at deeper horizons.

Output of gold has been declining over the past several years. Gold mines were nationalized in 1957-58 and worked by Kolar Gold Mining Undertaking (Mysore State Undertaking). The Ministry of Finance, Government of India, took over the administration of the Kolar Gold Mining Undertaking on December 1, 1962. John Taylor and Sons are still the consultants.

The production of gold from K.G.F. and Hutti gold mines in 1961 and 1962 is given below :

|                         |    | <i>Unit in Kg.</i> |       |
|-------------------------|----|--------------------|-------|
| <i>Name of the mine</i> |    | 1961               | 1962  |
| Mysore mine             | .. | 1,048              | 1,106 |
| Champion reef mine      |    | 1,610              | 1,406 |
| Nandi Drug mine         | .. | 1,537              | 1,780 |
| Hutti gold mine         |    | 673                | 788   |
|                         |    | 4,868              | 5,080 |

During the year 1969-70, 3,47,000 tonnes of ore were mined at the Kolar Gold Mining Undertaking. There was a yield of 1,979 kg. of gold valued at Rs. 1.67 crores at the International Monetary Fund rate. Production during the first nine months of 1970-71 (for which figures are available) was 1,582 kg. of gold valued at Rs. 1.34 crores. The fall in production during the year was mainly due to a brief strike by workers. The targeted production for the remaining three months of the year was 1,07,000 tonnes with an estimated gold yield of 701 kg. valued at Rs. 0.59 crore.

The ore reserves of the undertakings as at the end of 1969-70 were as follows:

|                       |    | <i>Payable ore reserves</i> | <i>Low grade ore reserves</i> |
|-----------------------|----|-----------------------------|-------------------------------|
| Quantity (in tonnes)  | .. | 17,58,295                   | 22,85,095                     |
| Grade (gm. per tonne) | .. | 11.368                      | 6.36                          |

**Minerals for Atomic Energy:** Uranium, radium and thorium are the chief fissionable elements. The most important source of uranium in India are the ancient metamorphic rocks, the grade is low. Beach sands of Tamil Nadu, Kerala and Maharashtra are important sources of thorium occurring in association with monazite. Monazite concentrates also contain 0.3 to 0.35 per cent uranium. A mine is being developed in Bihar for the production of uranium.

Other minerals like beryllium and lithium ores are found in large quantity as beryl and lepidolite (lithium mica) in pegmatites of Bihar and Rajasthan. On the whole, India possesses enough resources of atomic minerals.

**Other Minerals:** The production of other minerals like gypsum, limestone, dolomite, feldspar, magnesite, steatite, silica, salt and industrial clay has shown a spectacular rise. The expansion in the domestic fertilizer, cement, refractory, chemical, glass and ceramics industries during the Second Five Year Plan, has created large demand for these minerals. Mica, kyanite, ilmenite, sillimanite and barytes still depend almost entirely on the export market. The domestic consumption of sillimanite will, however, increase in view of the installation of a sillimanite refractory plant by the Assam Sillimanite Company Ltd., at Ramgarh in Bihar.

Although India's mineral production has shown a steady rise in recent years, much more remains to be done in the field of exploitation, processing, blending, utilization, beneficiation and manufacture of various products. The mining industry has to be modernized and equipped with the latest machinery. If our mining industry is to survive in this competitive age, we must think in terms of reducing the cost of production and large scale exploitation. On account of lack of capital resources and foreign exchange the Indian mining industry is lagging behind.

Since India has the world's largest reserves of iron ore and is surplus in many other minerals, export of minerals could make a big contribution to foreign exchange earnings.

#### ANNEXURE I

##### Trends in the Value of Mineral Production, Mineral Exports and Imports

| <i>Year</i> | <i>Value of total<br/>mineral production<br/>(Rs. million)</i> | <i>Value of<br/>mineral exports<br/>(Rs. million)</i> | <i>Value of<br/>mineral imports<br/>(Rs. million)</i> |
|-------------|----------------------------------------------------------------|-------------------------------------------------------|-------------------------------------------------------|
| 1948        | 693                                                            | N.A.                                                  | N.A.                                                  |

Figures in brackets indicate the value of crude petroleum imports.

\*From 1965 onwards the value of production includes the value of minerals produced in the Union Territory of Goa, Daman and Diu and also of petroleum and natural gas, but the total value does not include the value of minor minerals and atomic minerals produced in the country.

## Trends in Production of Principal Minerals and Metals in India after Independence

| Sl. No.  | Name of Mineral    | Unit of Qty. | Year   |         |         |         |         |           | Project Demand 1973-74 | Number of mines in '69 |  |

## CHAPTER VIII

# INDUSTRIES

### I. Industrial Policy Before Independence

The faint beginning of industrial policy in India under the British Crown can be traced to the report of the Famine Commission of 1880. The Commission attributed the frequency of rural distress to the decline of local industries brought about by imports from abroad, and recommended a policy of encouragement to local manufacturers. However, no move was made in this direction. *Laissez-faire* remained the ruling philosophy, though it was more of a dogma than a complete fact. The bureaucratic mind accepted the dogma but was too pragmatic to accept wholly the norms of Government policy derived from Western economic thinking.

The desire to aid the merchant was an important factor in the drive in the 1860's to develop Indian public works. Investment in social overheads, State guaranteed investments in railway and irrigation schemes, extraordinary measures to extend the cultivation of raw cotton, remodelling of land regulations to suit European settlement and investment, expenditure of public funds to encourage European entrepreneurship — these were all examples of judicious interventionism. On the other hand, *laissez-faire* principles were invoked against the infant industries argument in the 1890's over tariff policy and intervention in food trade during famines; progressive taxation was avoided, and a positive role in industrial development was almost unthinkable,\* though the State did set up a number of enterprises to meet its own requirements and, after 1908, undertook to enlarge its purchases of Indian manufactures.

Industrial development in the late 19th century was to a great extent a by-product of certain inter-related developments like improved transport and communications, growth of foreign trade and consequent accumulation of commercial fortunes. Railway building and maintenance had effects more far-reaching than opening up of the interior and exposing of agriculture to the winds of commerce. It released some of the latent potentialities for industrial advance.\*\* The coal industry could grow and expand; the development of engineering firms was geared to railway needs. Railway workshops had to be founded

and these workshops subsequently developed as important centres of modern mechanical engineering. The development and extension of the railways posed the question of the founding of iron works under the agency of the State, and when the Tatas embarked upon steel manufacture, they depended, in the initial years, to a considerable extent, on Government orders for rails. With the extension of the railway system, there arose the demand for bridged and metallised communications.

The strengthening of the British army after the Mutiny led to construction of barracks, founding of ordnance and army clothing factories and harness and saddlery workshops. In the interests of expanding trade, Government had to devote attention to the extension and maintenance of ports, harbours and docks. There was considerable building activity, and the decentralization of powers to municipal administrations after 1870 and 1883-84 also generated a large demand for water, drainage and sewerage iron works.

Government became the largest single purchaser of iron and steel work and a big buyer of miscellaneous manufactures. The Railway, Military and Public Works Departments made Government a crucial factor in industrial development, handicapped as it was by the absence of fiscal protection and insufficient supply of *entrepreneurs*. In fact, some of the paper mills, woollen, leather, iron and engineering factories were founded in anticipation of Government demands. The ruling class chose to pursue a *laissez-faire* policy but, even within that, there grew up a policy of purchasing local manufactures.

Under the Government of India Act, 1858, the Governor General had to obtain the sanction of the Secretary of State regarding the policy of purchasing stores. India Office maintained a close scrutiny and control over stores purchase policy. From 1858 to 1875 stores were imported exclusively through the India Office and were paid for in sterling. Following silver depreciation, and rising pressure from Indian manufacturers, the rules were relaxed in 1876, 1880, 1883, 1909, 1912 and 1913.

During the second half of the 19th century, a public sector had come into existence. State railways were the biggest undertaking. The Government founded railway workshops, ordnance factories, canal workshops, postal workshops, harness and saddlery factories, cotton gin factories, army clothing factories and printing presses. The possibility of developing iron resources could not be ignored when railways were being constructed and extended. The State engaged in iron manufacture and coal mining. Government factories successfully undertook limited manufacture of iron, steel, building and engineering materials, coal, tools and plant, leather, chemicals and drugs, printing and lithographic materials, scientific instruments, woollen, cotton, linen and silk goods.

In contrast with the philosophy of *laissez-faire* in British India, the

Mysore State Govt. took an active role in the promotion of industrial developments. As early as 1881, its Dewan disputed the law of comparative advantage and promised to give every attention to suggestions for industrial development. By then, the State had already established a savings bank, financed 75 per cent of the cost of laying railways within the State, and created water supply and utility services. A hydro-electric plant was commissioned in 1902, which laid the foundation of future industrial development.\*

The evaluation of industrial policy before independence can be divided in three periods, upto 1916, 1916-39 and 1939-46 and under three broad heads, viz., purchases of Government requirements (described as stores in earlier years), State enterprises and controls, and tariffs. The policy with regard to finance and management is dealt with separately under appropriate headings.

**Stores Purchase Policy:** In the absence of fiscal protection or direct assistance, purchases of Government stores could have played a key role in industrial development. The acceptance of this role, leaving aside its implementation, took a long time.

In December 1862, the Secretary of State for India laid down that all articles manufactured in England should only be procured through the India Office. The question of purchases in India did not arise. The value of purchases went up to £1.54 m., in 1875-76. Purchase of stores in India was first permitted in December 1876, subject to the condition that "nothing except articles of Indian origin shall be purchased or ordered in India unless it can be paid for on delivery after approval there (in India) and that no advances shall be made to any agent or firm for such service." In October 1877, Local Governments and officers were called upon to "suggest and discuss" the steps to be taken to substitute Indian manufactures for European manufactures and to encourage local manufactures.

After the report of the Indian Famine Commission in 1880 and the growing financial problems of the Government following the depreciation of the rupee and a number of disastrous famines, the Secretary of State amplified the objectives of relaxing the Stores Rules: (1) reduction of bills drawn upon Government of India, (2) encouragement of the local purchase and payment for anything which the local market could supply and (3) fostering the development of local industry. In the same year, Government of India issued new Stores Rules laying down that articles of Indian manufacture should be substituted for European articles "whenever it is possible to do, even at some temporary increase of cost." From 1879 to 1883, Government adopted a number of resolutions recommending the substitution of Indian for European manufactures, approving

---

\*Balakrishna: *Economic Development of Mysore.*

contracts for a term of years, listing the local firms which could supply specified and supplementary articles, and called for a careful scrutiny of indents for purchases abroad. As a result, purchases abroad fell slightly from £1.3 m., in 1881-82 to £1.1 m., in 1882-83.

**Indigenous Articles:** In January 1883, a major policy resolution was adopted: "The Government of India is desirous to give the utmost encouragement to every effort to substitute for articles now obtained from Europe, articles of bonafide local manufacture or of indigenous origin; and when articles of European and Indian manufacture do not differ materially in price and quality, the Government would always be disposed to give the preference to the latter; and the Governor General-in-Council desires to remind all officers of Government that there is no reason why articles manufactured in India should not be obtained locally, even though the raw materials necessary for their manufacture may have been originally imported from Europe. It is most desirable to bear in mind the distinction between articles of European manufacture and articles produced or worked up in India from imported material; the former should not, save in exceptional cases, be purchased in the local market, while the latter should by preference be purchased locally whenever the quality is sufficiently good and the price not higher than the cost of laying down the imported article. There are many articles which may not be immediately obtained in the local market but which can be made in the event of Government encouraging the manufacture."

With regard to iron and steel work, however, relaxation was slow in coming. Moreover, no special agency was maintained in India till as late as 1922 for the purchase and inspection of articles manufactured in India; the purchases were handled by officers of various departments. The value of stores manufactured and purchased in India by the Government of India rose from Rs. 39 lakhs in 1882-83 to Rs. 107 lakhs in 1891-92, Rs. 202 lakhs in 1904-05 but declined thereafter to Rs. 119 lakhs in 1907-08. The articles purchased (including those from Government establishments) included coal and coke, paper and paste-board, building and engineering materials, chemical products, drugs and medicines, cordage and rope, cotton, linen and silk goods, hardware and cutlery, leather and leather goods, paints and colours, oils, scientific instruments and apparatus, wood, woollens, tools, canvas, tin, iron and steel. The purchases of steel, machinery, agricultural implements, iron wire, steel wire, and glassware were insignificant.

Rigid rules were laid down for local purchases of imported stores. Their purchases were more or less restricted to emergency requirements because inspection was difficult and costly. Such purchases were Rs. 41 lakhs in 1882-83, Rs. 36 lakhs in 1891-92, Rs. 46 lakhs in 1904-05 and Rs. 56 lakhs in 1913-14. Local bodies and private demand, rather

than Government orders, enabled the mercantile houses to flourish in business.

Government spent £75 m. for import of stores from India Office between 1882-83 and 1913-14\* against Rs. 338 m. spent in India during the same period. The objective of reducing payments in England for stores remained unfulfilled, mainly because the purchases for State railways continued to impose a heavy drain. The manufacture of iron work and machinery was the crux of the problem, as Lord Ripon, the then Governor General, had recognized in 1883. In 1913, Government expressed its satisfaction at having done all that could be done but noted the slow growth and inefficient standards of industrial enterprise in India.\*

Even the limited support received through Government purchases proved invaluable. A committee appointed in 1902 to enquire into the paper industry and its supplies at alleged monopolistic prices to Government found that some of the mills could not have started or continued without Government and railway orders. In the case of woollen mills, Government purchases were 87 per cent of total sales in 1885 (mills were exclusively European), declining to 8 per cent in 1905, but the difficult years had been taken care of.

During the second half of the 19th century, India became a large and growing market for the products of the British iron and steel industry, which were imported through the India Stores Office. In 1863, the import duty on iron was reduced from 10 to 1 per cent and machinery was placed on the free list.

**Bengal Iron and Tatas:** After the failure of Heath's pioneer attempt in 1824 and the subsequent failure of the East Indian Iron Works between 1853 and 1876 due to shortage of capital and exhaustion of charcoal sources, and unwillingness of Government to accept any liabilities, the Bengal Iron Works at Barakar came up in 1876 but Government refused to pledge advance orders to them. The works were purchased by Government in 1881. In 1882, Ripon's Government "accepted as proved that India possesses the means of supplying all her wants in respect of cast iron, wrought iron and steel, and that such supply could be produced remuneratively on a strictly commercial basis." But the Secretary of State took a different view and the Government of India was prohibited from giving any preference to Indian manufacturers when entering into contracts for iron materials. In 1889, the Barakar Works were sold to Bengal Iron and Steel, a sterling company.

Though this Company ran into difficulties in the 1890's and its requests for financial assistance were repeatedly turned down, it was able to secure railway orders and a reduction in the royalties payable on coal.

---

\*See: *Op. cit.*, pp. 24-27.

In 1896, the Company was given a Government contract for the supply of 10,160 tonnes of pig iron and castings annually for 10 years at rates 5 per cent lower than similar materials could be obtained from time to time in England. This concession enabled the Company to do well and by 1901 its annual production of pig iron rose to 25,401 tonnes, of which 10,160 tonnes was supplied to State railways. This relaxation in the mid-nineties coincided with the recovery of the English iron trade from the long depression which had begun in the seventies, and the fact that one-third of the iron and one-half of the steel imported into India were from countries other than the U.K. The coincidence was not a pure accident.

In January 1903, a contract was signed between Government and Bengal Iron and Steel, under which Government agreed to give a subsidy of £1,500 per year (3 per cent on a capital of £50,000) for ten years to be reduced by Rs. 3 per tonne for every tonne of steel purchased by Government. The plant was erected in June 1904 and commissioned in November 1904. It was closed down in 1906 due to inadequacy of orders from Government, railways and private buyers. Its pig iron production continued but when the 1896 agreement expired in 1907, Government refused to renew it.

The Tatas were more fortunate than the sterling company. In 1902, Tata asked for an assurance from the Secretary of State that, "when making purchases, the Indian Government would be willing *ceteris paribus* to give preference to our manufactures over imported material, especially iron and steel". Viceroy Curzon replied in January 1903 expressing the Government's desire to give preference to local production provided the quality was not inferior to and the price not higher than similar supplies obtained through the India Office and that Tata's Company and other manufacturing firms in India would have to stand on the same level. Nevertheless, Tata received Government pledges almost straightway: a guarantee in 1905 to purchase 20,321 tonnes of steel rails annually for ten years, promise in 1906 to purchase as much as possible of pig iron, reduced railway freight rates for carriage of construction materials and plant, and the opening of a new railway line to connect the plant to iron ore mines. The managing agents were satisfied with "the very generous concessions" from Government. The good quality of Tata products helped in securing orders from private railways and engineering firms in Calcutta and Bombay also.

The total capacity of the two iron works, Bengal and Tata, remained, nevertheless, only a fraction of the total amount of iron and steel imported. A large part of the demand was met by mercantile houses (though their supplies were not always of the best quality), thereby promoting commerce, not industry.

**Engineering Stores:** The engineering industry survived in the initial

years mainly due to port, municipal and private, rather than Government, demand. The relaxation of Stores Rules in 1876 did not help the engineering industry at all, since engineering stores were to be procured exclusively through London. In 1887, in fact, the Secretary of State pointed out the dangers of depending upon local engineering purchases and, in 1888, further asked Government to issue instructions "with a view to limiting to the utmost the local purchase of building materials not produced in India." Local purchases declined from Rs. 3 lakhs in 1882-83 to Rs. 45 thousand in 1887-88. In 1891 some relaxation was made on grounds of economy, not protection, for less important manufactured articles of iron and steel made up in India from unfinished imported articles, but railway supplies were again excluded. From 1882-83 to 1898-99, the value of building and engineering materials, tools and plant, and machinery imported through London came to Rs. 437 lakhs and the materials of another Rs. 60 lakhs were procured from local agents of European suppliers.

Some relaxation in local purchases of engineering stores was effected in 1897 but initial equipment for railways and large engineering projects was again excluded. From 1899 to 1905, a series of relaxations were made: beginning with careful scrutiny of indents before transmission to London through the instance in 1901 that "wheels, axles, springs and drawgear should be indented from the India Office", to the Railway Board orders in 1905 that 25 per cent of all goods stock required for State railways, would be called for in India.

In 1906, the British Government admitted that "local industries must frequently lean to some extent, in the first instance, upon the support of the Government" and that "the system at present prescribed for the purchase of stores does not in practice result in the maximum amount of encouragement which the Government could legitimately give." The matter was referred to a Stores Committee which sharply criticized the stores purchase policy especially in relation to iron and steel and engineering industries. The Committee found that Indian manufacturers were hesitant because of lack of assurance and continuity of orders, that officials suffered from a fear of infringement of the very precisely defined conditions under which purchases could be made in India, and that orders placed locally were largely rush orders. Indian manufacturers were expected to supply an article equal in quality to that obtainable in England "but the work allotted to them was too small to attain a pitch of excellence which had been achieved elsewhere after years of practice." Most engineering products were disqualified because they were inevitably dependent upon imported materials like plates for wagons. In a scrutiny of indents worth £3.3 m., placed on the India Office in 1904-05, the Committee found that orders of £467,000 could have been placed locally.

In spite of insufficient and discontinuous orders from Government, Indian i.e., mostly British-owned, firms succeeded in increasing their business considerably after 1882-83, thanks to the expansion of jute, cotton and tea industries, port and municipal requirements and demand for bridges for railway companies. Firms in Bombay and Calcutta depended mainly on private demand, those in Madras and Upper India on Government.

**Swadeshi Movement:** In 1909, after some acrimonious debate between the Government of India and London and the launching of the Swadeshi movement, new Stores Rules were promulgated, in spite of a request for their suspension from the Secretary of State, who finally insisted on laying down that local purchases of electric power and lighting plant would not be permitted. The Rules prescribed that preference should be accorded to articles manufactured from imported materials and indents should be scrutinized before transmission to London. The purchase of wheels and axles and springs of rolling stock was not permitted; railway bridges of spans upto 45.75 metres only could be purchased.\* The list of approved firms in India was progressively enlarged, from 14 in 1897 to 40 in 1913. These relaxations notwithstanding, there was no appreciable increase in orders for stores produced in India. The value of European stores (engineering and building materials, tools, machinery and plant) procured in India rose from Rs. 15 lakhs in 1908-09 to Rs. 36 lakhs in 1913-14, while purchases of Indian stores rose from Rs. 9 lakhs to Rs. 20 lakhs only.

**State Enterprises:** "In a previous age, Indian industries had flourished round the thrones of the rulers and had looked to them for support; and the tendency was always to expect from Government a more positive regulation of activity than has been usual in those countries where individualistic ideals have been dominant. With the wave of nationalism which marked the first decade of the 20th century, enthusiasm for industrial advance became general among the educated classes. The acceptance by Government of the role assigned to it was not easily secured; and it was not until after the outbreak of war that Government, as a whole, accepted responsibility for giving active assistance to industries."\*\*

The inhibitions of *laissez-faire* were most obvious in the setting up of State enterprises though they did not prevent Government from establishing assorted works to meet part of its own requirements. The principal advantages which Government had were its capacity to hire and retain

---

\*For the text of the Rules, see Sen: op. cit., Appendix A.

\*\*Clow: *The State and Industry*, 1928.

high grade technicians and to generate its own demand for products. These advantages were barely utilized.

Iron-making was attempted in the 1850's and 60's and culminated in the acquisition of the Barakar Works against the opposition of the Secretary of State. From 1885 to 1889, when Barakar Works were in Government hands, local firms including Jessop and Martin petitioned against the unfair competition offered by the Works and requested that its production be confined to pig iron and cast iron sleepers for railways. In 1889, the Works were sold to Bengal Iron and Steel.

The number of railway workshops rose from 77 in 1901 to 96 in 1905 and persons employed therein from 60,000 to 79,000; they served as nuclei for the growth of mechanical engineering but few Indians received technical training in them.

There were already five ordnance factories in 1889, turning out a high standard of work; the Cossipore factory was the first to manufacture steel in India in 1905. The value of imported ordnance and miscellaneous military stores, nevertheless, came to nearly £10 m., between 1883-84 and 1913-14.

Pioneer factories were started in Tamil Nadu for aluminium, chrome tanning and weaving, and an Industries Department under the energetic Chatterton, a European civilian (later Controller of Munitions and a member of the Industrial Commission) was set up in 1906. Even these aroused the fury of local business; the Madras Chamber of Commerce unanimously and strongly opposed the flotation of industrial enterprises by Government.

Morley's infamous Despatch of 1910 cooled what little official ardour there was for State enterprises:

"The policy which I am prepared to sanction is State funds may be expended upon familiarising the people with such improvements in the methods of production as modern science and the practice of European countries can suggest; further than this the State should not go and it must be left to private enterprise to demonstrate that these improvements can be adopted with commercial advantage."

Morley's Despatch was not the only discouraging factor. All the various interests were working at cross-purposes. British manufacturers opposed fiscal protection and relaxation of Stores Rules. European manufacturers in India urged relaxation of Stores Rules but opposed State enterprise and State control. Indian manufacturers were critical of *laissez-faire* and unanimously favoured protection, relaxation of Stores Rules, and pioneer (not permanent State) enterprises.

All that was done in pioneering enterprises, technical and industrial education and commercial and industrial information, was due rather to a few far-sighted individual officers than to any considered and general policy on the part of Government. On the eve of the war, four engineer-

ing colleges had been in existence for a generation but they produced civil engineers who were absorbed in Government and did little to foster industries. Technical schools were started in centres where there were no industries and no prospects of the development of industries; candidates too, were often lacking.

**Tariff Policy:** Fiscal protection could have played only a very limited role in industrial development during the late 19th century. Leaving aside the exceptional case of cotton mills (which got the reverse of protection but expanded and prospered nevertheless), protective tariffs would have in isolation done little to promote industries heavier than cotton under Indian ownership and management, without a definite policy for local purchases by Government of its requirements or for setting up of State-managed or State-financed and promoted enterprises, given the shortage of Indian capital and technical skill for mechanized enterprises. At best, protective tariffs on ferrous and engineering items, had they been imposed against the prevailing climate of opinion, might have brought about a somewhat larger influx of foreign capital into the industries concerned in order to pierce the tariff wall. Even that might have been worthwhile but it did not come about largely because returns from material-based industries, cotton and jute, which required minimum imported skill and large cheap domestic labour were attractive enough to absorb most of the capital inflow.

Under the East India Company, the task of abolishing inland duties was taken up seriously in 1835 and completed in 1844. Though import duties were levied by the different provinces, a fairly consistent tariff was evolved by the late forties. Generally, the duties on raw produce were  $3\frac{1}{2}$  per cent and on manufactured articles  $3\frac{1}{2}$  or 5 per cent; till 1848, these duties were doubled for goods imported in non-British ships. After 1848, the nationality of ships was ignored but, till 1859, the duty on non-British goods was double that on British goods. After 1859, revenue needs led to the abolition of differential rates, and the general rate of duty was raised from 5 to 10 per cent; the duty on cotton yarn was raised from  $3\frac{1}{2}$  to 5 per cent. From 1862 onwards, financial exigencies no longer demanded large revenue from import duties; the duty on cotton piece-goods was reduced to 5 per cent and on yarn to  $3\frac{1}{2}$  per cent. In 1864, the general rate was lowered to  $7\frac{1}{2}$  per cent.

Free trade as a matter of policy was ushered in from 1875, when Government found itself with surplus revenues. The general import duty rate was lowered from  $7\frac{1}{2}$  to 5 per cent, but the duties on piece-goods and yarn were left untouched, which raised a storm in Manchester. The Secretary of State directed Government to abolish the cotton duties as soon as its finances permitted. The cotton duties were partially lifted in 1878 and 1879, mainly from items which were being produced

in India. In proposing these changes, the Finance Member laid down the following principles governing tariff policy:

- (a) "That no duty should exist which affords protection to native industry, and as a corollary, that no duty should be applied to any article which can be produced at home, without an equivalent duty of excise on the home production; and also that no duty should be levied except for purely fiscal purposes.
- (b) "That as far as possible the raw materials of industry and articles contributing to production should be exempt from customs taxation.
- (c) "That the duties should be applied only to articles which yield a revenue of sufficient importance to justify the interference with trade involved by that machinery of collection."

In 1882, Government concluded that it could do without customs revenues and that "the duties still existing caused an amount of friction, scrutiny and interference with trade quite incommensurate with the net revenue they produced." From 1882 to 1894, no import duties were levied, with the exception of duties on arms and ammunition for administrative reasons, liquor, opium and salt (which were complementary to excise policy), and a nominal revenue duty on petroleum which was imposed in 1888. Correspondingly all export duties, except on rice, were also abolished between 1860 and 1882.

The sacrifice of customs revenues which was supposed to bring the classical benefits of free trade to the poor toiling masses of rural India succeeded only in increasing their misery. Local industries declined rapidly—the only major exception was handlooms which expanded due to the greater availability of yarn—and land revenue grew more oppressive, particularly as silver depreciated and the rupee value of Home Charges mounted at an alarming pace. In 1894, import duties were levied again at the general rate of 5 per cent; railway materials and machinery were left free, and the rate was only 1 per cent on iron and steel; the Secretary of State declined to permit any duty on the chief import, namely, cotton piece-goods. By December of the same year, the revenue position necessitated the imposition of a 5 per cent duty on cotton piece-goods and yarn; this was balanced by the infamous countervailing excise of 5 per cent on yarn counts above 20s. The limitation of excise to yarn failed to satisfy Lancashire. Accordingly, in 1896, the import duty on piece-goods was lowered to 3½ per cent with an equivalent countervailing excise on Indian piece-goods, and cotton yarn was admitted free of duty. This level and structure of import duties remained practically unaltered till 1916.

On the eve of the First World War, the cotton mill industry (which was largely but not wholly under Indian ownership and management) could hardly be described as an infant. In 1913-14, India had 271 mills with

nearly 68 lakh spindles and 1 lakh looms. But there was no mill machinery industry. The explanation lay for the most part in the general absence of an engineering infra-structure, fairly consistent decline in the prices of British textile machinery from the 1890's through the 1870's and lack of skills. The industry depended to a considerable extent for its prosperity on sales of yarn at home and abroad which implied a corresponding emphasis on preparatory and spinning machinery, rather than weaving equipment. Since the former was more complex and novel than the latter, the difficulties in undertaking its manufacture were greater. As new Indian *entrepreneurs*, unfamiliar with textile technology, entered the industry in rapid succession, they placed orders for what they believed was the best equipment available. British machinery suppliers like Greaves and Cotton who went into manufacture had no reservations or doubts about their choice.

**Industrial Policy 1916-39:** The outbreak of the First World War brought about a considerable change for the better industrial policy thinking. The implementation of this change was rendered difficult during the war by the practical absence of engineering and chemical capacity and trained personnel, and later, in the twenties, by the appearance of severe international competition and consequent demoralization of Indian capital, and pressure from British manufacturers to retain the Indian market. Tariff policy, at first for revenue and then for protective purposes, acquired much greater importance during this period though Indian middle class opinion continued to regard it as halting and inadequate. Government store purchase policies also became more explicitly helpful to industrial development and acquired greater significance as private railway companies were progressively acquired by Government. The consistent decline in the prices of imported machinery after 1923 and piecemeal protection to individual industries, however, made entry into machinery industries unattractive. Barring sporadic attempts to finance some industrial units, most of which ended in failure, there was no policy for direct promotion of private projects or setting up of public enterprises to fill up gaps in the industrial structure. Vocal Indian opinion, when not preoccupied with fiscal protection, seldom went beyond muted demand for pioneer factories. Constitutional reforms divested the centre of responsibility for industry and vested it in provinces, which lacked the resources and perspective for sustained large-scale interest in industrial development.

In 1912, the Atkinson-Dawson Committee was appointed to enquire into the means of bringing technical institutions into closer touch with employers of labour and, in 1913, the Morison Committee reported to the Secretary of State on the system of State technical scholarships established in 1904. A real change of policy came about only in 1916 with the setting up of the Munitions Board and the appointment of the

Industrial Commission, both under a common chairman.

The functions of the Munitions Board which came into being in February 1917, were to control and develop Indian resources, with special reference to the needs created by the war, to regulate contracts, to limit and co-ordinate demands for articles not manufactured in India, and to apply the manufacturing resources of India to war purposes, with the special object of reducing demands on shipping. The Board was responsible for the supply of all articles except foodstuffs, medical stores and certain technical stores, to all armies in the East. At the peak of its operations, the Board was buying textiles at the rate of Rs. 2 crores a month and hides and leather worth Rs. 1 crore a month. Besides, it scrutinized all indents for stores and could divert purchases from Europe to India. Priority was generally refused when a suitable substitute could be purchased or arranged for manufacture in a short time. The opportunities so created were brought to the notice of manufacturers with the result that a large number of new branches of manufacture were started. Expert assistance was made available in many cases. Ordnance factories were greatly expanded, and attention was paid to the manufacture of accessories for various industries. The Industrial Commission was so impressed by the working of its twin that it hoped "that care will be taken to preserve such features of this organisation (the Munitions Board) as are properly adaptable to peace conditions."

The Industrial Commission was appointed in May 1916 to examine and report upon the possibilities of further industrial development in India, particularly

- (a) whether new openings for the profitable employment of Indian capital in commerce and industry can be indicated;
- (b) whether and, if so, in what manner Government can usefully give direct encouragement to industrial development—
  - (i) by rendering technical advice more freely available,
  - (ii) by the demonstration of the practical possibility on a commercial scale of particular industries,
  - (iii) by affording, directly or indirectly, financial assistance to industrial enterprises, or
  - (iv) by any other means which are not incompatible with the existing fiscal policy of the Government of India.

Questions of tariff policy were excluded from the scope of its enquiries. The Commission drew attention to the extraordinary extent to which the country, with its great industrial possibilities and requirements, was dependent upon outside sources of supply for raw materials and manufactured articles. It found the cause in the fact that export and import trade and a large railway network had been created without an iron and steel complex to support it. Only the obvious need of having repairs done on the spot had led to the establishment of numerous engineering

workshops, without any corresponding equipment for actual manufacture. The direction of industrial development had been predetermined by the existence of a large export trade in raw materials, and by the ease with which most classes of manufactured articles could be imported from abroad. The Commission attributed the import of boilers and prime movers to the absence of a complete system of engineering industries. Lack of familiarity with machinery accounted for the fact that the demand for agricultural machinery was limited to the products of a few small local manufacturers, supplemented by imports worth Rs. 2½ lakhs in 1913-14. India produced 3.048 m. tonnes of raw sugar and imported sugar worth Rs. 15 crores, but the value of sugar machinery imported was only Rs. 4½ lakhs. Similarly, oilseeds worth nearly Rs. 25 crores were exported but import of crushing and refining plant was only Rs. 3 lakhs. Paper imports cost Rs. 160 lakhs while import of paper mill machinery was only Rs. 3½ lakhs.

"These figures", the Commission said "are significant of the exiguity of the efforts hitherto made in India to replace imported articles by the manufacture of indigenous raw materials. On the other hand, the very large value of the imports of machinery for the textile industry is due to the entire absence of any engineering works capable of supplying her needs." It also pinpointed the dependence on imported technologists and engineers and the preference of capital for a safe profit from trade or such well established industries as jute and cotton to a doubtful return from such ventures as metallurgical and chemical manufactures. "The industries based on technical science have been disregarded, because profits in other ways have been easy and assured. The neglect of applied science is, perhaps, the most conspicuous among our administrative deficiencies." Another contributory cause has been absence of a stores purchase organization to counteract "the tendency of indenting officers to place on some recognised authority the responsibility for price and quality."

The Commission listed the main deficiencies as in metals, chemicals\*, rubber, superior textiles, leather finishing and cement. The Commission warned that "until they (the recommended industries) are brought into existence on an adequate scale, Indian capitalists will, in times of peace, be deprived of a number of profitable enterprises whilst in the event of war which renders sea transport impossible, India's all-important existing industries will be exposed to the risk of stoppage, her consumers to great hardship, and her armed forces to the gravest possible danger." It recommended that Government should take special steps to facilitate the manufacture of such essential articles as magnetos, incandescent

---

\*These deficiencies and the concerted measures required to overcome them were re-echoed in the Planning Commission's *Notes on Perspective of Development*, 1960-61 to 1975-76, published in 1964.

lamps, ferro-tungsten, high speed steel graphite crucibles, porcelain insulators, chemical glass and certain heavy chemicals, rubber and vulcanite.

The Commission also recommended the creation of Scientific and Technical Service cadres, training facilities, and acquisition of lands for industrial enterprises. Regarding purchases of stores, it favoured the creation of an organization for purchase and inspection under Imperial and Provincial Departments of Industries, the meeting of all indents of Government and railways as far as possible in India, and the setting up of an agency for preparing specifications. As for cottage and small industries, it recommended familiarization with the principles of co-operative credit, small loans from Provincial Governments, facilities for marketing, technical training, and education in the use of new tools and designs.

**Post-War Difficulties:** In post-war years, constitutional reforms, deteriorations in economic conditions, attractions of protection and political opposition to the creation of new service cadres combined to distract attention from the Commission's recommendations.

The Commission's report was in favour of centralization, but the Reforms of 1919 led to decentralization. The general result was a separation of the spheres of influence of the Central and Provincial Governments in regard to development of industries. The adoption of a policy of protection was, at a somewhat later date, to place the Government of India in a position to assist industries substantially. It was also able to exercise some influence on the development of industries by means of its purchasing activity. In all other directions, its power to advance industrial progress was restricted. Provincial Governments, on the other hand, were unable to adopt protective policies and the comparatively small extent of their own requirements of stores made it difficult for them to make an impact with their purchases. They had to face serious financial difficulties and the two features which the Industrial Commission had regarded as the chief obstacles to progress, viz., "the lack of a definite and accepted policy and the absence of an appropriate organisation of specialised experts" remained after the Reforms. "Much was achieved despite these difficulties" but, in the absence of a uniform all-India policy, the element "of co-ordination was necessarily weak and in consequence it was not always possible to secure the fullest results from the efforts which were made."\* The idea that industry was to be a transferred subject but the administration would be in the hands of all-India services proved unpopular, especially since it was feared that the services would be exclusively European. The

\*Clew: *The State and Industry*. This is the main source for policy during the twenties.

idea of industrial service cadres was finally abandoned in 1922.

The prospects of industrial development became considerably dimmer before most of the new Industries Departments in the provinces could be effective. Retrenchment after 1922 fell heavily on these Departments, since large industrialists did not need them and the smaller ones were not vocal. At the Centre, the Industrial Intelligence Section disappeared, inter-provincial conferences, publications and scholarships were discontinued. Fortunately, the stores branch was not disbanded as recommended by the Inchcape Committee on retrenchment.

A Stores Purchase Committee was appointed by the end of 1919 to recommend measures to enable Government to "obtain their requirements so far as possible in India." It recognized that the policy of purchasing Indian stores was defeated by the absence of an agency for purchase and inspection and recommended the setting up of a department to purchase and inspect certain stores, particularly oils and paints, leather, textiles and timber and engineering stores for all Central departments except military, railways and public works. Company railways, provinces and States, and municipalities could also employ the Department. The Committee was divided on the question of local purchase of imported goods; the majority was in favour of purchasing imported stores through resident middlemen but the minority was against it.

New rules were published in 1924. The preamble stated that "the policy of the Government of India is to make their purchases of stores for the public service in such a way as to encourage the industries of the country, so far as is consistent with economy and efficiency." Instead of the prices being "not unfavourable," the prices now were to be only reasonable. Subject to certain conditions, purchases of machinery manufactured abroad were permitted in India from branches of approved manufacturing firms. This formed an exception to the principle followed hitherto that Indian goods should be purchased in India and foreign goods in London. The Legislative Assembly passed a resolution calling for a system of rupee tenders for delivery in India, but this was not accepted till 1927 in principle. The new rules did not apply to the provinces.

In 1928, new rules were drafted giving preference, first, to articles produced in India from Indian materials, second, to articles wholly or partially manufactured in India from imported materials and, third, to articles held in stock in India. With certain exceptions, all stores were to be purchased in India and tenders were to be for supply in India against rupees.

In spite of the halving of its budget in 1922 by the Legislative Assembly, and the stoppage of its expansion recommended by the Inchcape Committee (which Government did not accept), the Indian Stores Department dealt with textiles and leather, engineering, hardware and miscel-

laneous articles. It also looked after intelligence, a metallurgical inspectorate at Jamshedpur, and the Alipore Test House and had inspecting offices at Calcutta, Kanpur, Bombay, Karachi and Madras. Its purchases, mainly textiles and leather, went up from Rs. 165 lakhs in 1922-23 to Rs. 373 lakhs in 1927-28, and stores inspected during the same period from Rs. 142 lakhs to Rs. 574 lakhs. But these represented only a fraction of the purchases of Government and railways.

**State Enterprises:** In the twenties, the Government continued to supply a large (though unquantified) part of its own needs. About 10 per cent of the factory population in the mid-twenties was employed in public factories and a considerable number of minors worked in Government-owned coal and salt mines. The Government of Madras, as before, took the lead in pioneering enterprises and its Industrial Institute conducted a number of experiments, both successful and unsuccessful; projects for ink, soap, fish canning and bone-meal succeeded while adhesives and fruit canning failed; the Institute also demonstrated the successful use of power-driven sugarcane crushing. In Bombay, fish trawling and oil extraction failed, mainly because the fish refused to co-operate; alleged interference with private enterprise led to the closure of a semi-commercial porcelain factory in the J.J. School of Art, Bihar and Orissa failed to set up a projected sugar factory, and its forays into blankets and matches proved unsuccessful. The Punjab model tannery made heavy losses and was closed down in 1927. In Uttar Pradesh the State turpentine factory did extremely well after the transfer of its majority control to private hands, while a bobbin factory had a chequered career even after such transfer. Clow's careful comment on the situation was: "It seems probable that, with the increase of industrial enterprise in India, the field for successful State pioneering factories has contracted and will contract further."

In 1927, the Railway Board was attacked for having ordered too many wagons and it became evident that orders for wagons would be small for some time. This was an industry which had received a guarantee from Government in 1918 of purchase of a specified number of wagons subject to conditions regarding price and quality. This undertaking was withdrawn in 1924 when the industry received protection but remained dependent upon Government. In the course of negotiations with two exclusive wagon manufacturing companies which had been formed as a result of the guarantee, one was taken over by Government.

Some of the progressive Princely States, however, seemed to have taken the recommendations of the Industrial Commission rather seriously. Mysore, Hyderabad, Gwalior, Baroda and many of the Kathiawar States actively financed several large industrial ventures in British India and some of them made special efforts to attract *entrepreneurs* with offers of assistance and concessions.

Mysore followed up its earlier pioneering efforts with the establishment of an iron and steel works based on charcoal in 1923, and factories for sandal-wood oil, buttons and experimental industries like power-driven crushing mills and jaggery manufacture. In addition to outright ownership, the State made loans, gave guarantees, provided research and technical assistance, and participated in the share capital of private enterprises. During 1917-22, according to the Mysore State Gazetteer, the State department of industry "stimulated private initiative and private effort in the installation of machinery for deep well pumping, in the more efficient utilisation of agricultural production by means of power-driven machinery, and the establishment of a number of small organised industries in various parts of the State". These enterprises lost very little money over the years prior to the depression. In the thirties, the State set up a sugar factory and a paper mill as Government companies, carried out preliminary surveys and investigations for a number of projects, and participated in the share capital of a silk factory and granted various kinds of concessions like free or cheap land, power and materials for a number of engineering enterprises.

Hyderabad started an Industrial Trust Fund in 1929 for aid to industries with a capital of Rs. 1 crore; for improvement and development of small and cottage industries, industrial experiments and demonstrations, and economic and industrial enquiries; and for the provision of grants in aid for research work and scholarships for industrial training. Its funds were also used for investment in leading public companies outside the State.

Baroda took some interest in industrial development within the State from the 1880's but most of the assisted enterprises failed. After these failures, the State confined its assistance to financial participation in banking and several well known public companies like Tata Chemicals, etc.

The larger and coastal States of Kathiawar also took a keen interest during the inter-war years in the setting up of cotton mills and various miscellaneous activities like pottery. This interest was more prestigious, than motivated by purely business or economic considerations, though many of these enterprises did well during the Second World War.

**Protection:** If the Reforms made it difficult or impossible for the Government of India to assist Indian industries by some methods, they were destined to provide the Central Legislature and the Central Government with a method of granting State assistance hitherto untried in India. India became fiscally autonomous in 1919. The Montagu-Chelmsford report said:

"Desiring industries which will give him Indian-made clothes to wear and Indian-made articles to use, the educated Indian looks to the example of other countries which have relied on tariffs, and seizes on

the admission of even free traders that for the nourishment of nascent industries a tariff is permissible. We do not know whether he pauses to reflect that these industries will be largely financed by foreign capital attracted by the tariff, although we have evidence that he has not learned to appreciate the advantages of foreign capital.... So long as the people who refuse India protection are interested in manufactures with which India might compete, Indian opinion cannot bring itself to believe that the refusal is disinterested or dictated by care for the best interests of India."

The Fiscal Commission 1921-22 was unanimous in finding that the adoption of a policy of protection was in the best interests of India, but was divided on the extent and scope of protection. The majority favoured discriminating protection for industries subject to three main safeguards: (1) the industry should possess natural advantages, (2) without the help of protection it is not likely to develop at all or not so rapidly as is desirable, and (3) it will eventually be able to face world competition without protection. Claims for protection were to be examined by a Tariff Board independent of political influence. While recommending protection, the Tariff Board was to keep the following broad principles in mind:

- (1) Industries that are subject to the law of increasing returns as well as those which are capable of supplying the entire home market should be regarded as possessing additional claims to protection.
- (2) Even though the protection of a particular industry should involve injury to the interests of other related industries, the Tariff Board should not withhold protection from that industry, provided that such protection is calculated to result in an economic advantage to the country.
- (3) While protection should ordinarily be granted to what are called infant industries, it may also be extended to industries that are in a state of temporary deterioration or atrophy and even to a strong and prosperous industry which might thereby be induced to develop a new branch.
- (4) Tariff protection should not ordinarily be granted to new industries.
- (5) The rate of protection should be neither too low nor too high, and should be determined primarily in the light of comparative costs.
- (6) The Tariff Board should be directed to review periodically the protection given to different industries so as to indicate the desirability of the continuance, or modification, or withdrawal, of protection.

The Chairman and four members did not endorse these safeguards and desired that no safeguard be laid down other than "such discrimi-

nation as may be considered necessary by the Government of India and the Indian Legislature." They wanted the Tariff Board to be semi-political and semi-commercial. Among other main recommendations, the Commission also suggested the abolition of the cotton excise duty (on political grounds), levy of customs duty on Government imports (accepted in 1924), and restriction of Government monopolies or concessions of foreign capital to firms registered in India with rupee capital and having a reasonable proportion of Indian directors and willing to train Indian apprentices. The minority wished to impose these conditions by legislation on all foreign firms establishing industries behind the tariff wall.

The Commission also recommended that raw materials and machinery be ordinarily admitted free of duty and that semi-manufactured goods used in Indian industries be taxed as lightly as possible. Industries essential for national defence and for the development of which conditions in India are "not unfavourable" should "be adequately protected if necessary". Regarding Imperial preference, it suggested that no such general system be introduced but the question of preferential duties on a limited number of commodities could be considered by the Legislature on the recommendation of the Tariff Board. No such preference should diminish the protection required by industries or involve on balance any appreciable economic loss to India. Any preference to be given to U. K. should be granted as a free gift but, in the case of other Empire countries, preference should be granted only on the basis of mutually advantageous agreements. It unreservedly condemned the cotton excise duty and called for the regulation of excise policy solely in the interests of India.

Though Government was agitated over the harm that protection would do to the inarticulate agricultural masses, the necessity of raising revenue had already led to large increases in customs duties so that some industries were already enjoying a fair measure of protection. Annual revenue from import duties had gone up from Rs. 8 crores in the period 1909-10 to 1913-14 (average) to Rs. 12 crores in 1917-18 and Rs. 28 crores in 1921-22. As a proportion of total revenue, import duties rose from 12 per cent in pre-war years to 24 per cent in 1921-22. These increases had not been made uniformly nor had they been made solely with regard to consideration of revenue. To some extent, therefore, the new policy involved the substitution of a tariff scientifically designed to assist industries for one which was arbitrary and irregular in its effects on industries.

The Commission had recommended first priority for protecting the iron and steel industry which was facing severe competition from imports after enjoying the prosperity brought about by war orders. The first Tariff Board made a detailed investigation into the costs of Tata Iron & Steel and the effects of protection on steel-using industries and recom-

mended substantial increases in import duties on iron and steel in various forms and the grant of bounties on steel rails and fishplates and on railway wagons. The burden was estimated at Rs. 1.5 crores per year, over a third of which would be borne by the general consumer, the remainder by public bodies, railways and larger industries. The alternative was extinction of the industry and severe damage to industrial confidence, besides loss of employment of trained personnel and severe loss to the coal industry. When the recommendation came before a special session of the Legislature, members argued, for the first time, the pros and cons of protection, nationalization and advisability of confining protection to grant of bounties. The Assembly deleted the proposal for duty on agricultural implements, and approved protection for three years. Within two months, the company applied again for further duties because of dumping by Continental producers. In January 1925, the previous duties were left intact but the additional protection recommended was given in the form of bounties.

|                   | <i>Duty before<br/>April 1924</i> | <i>Duty approved<br/>June 1924</i> | <i>Duty Proposed<br/>November 1924</i> |
|-------------------|-----------------------------------|------------------------------------|----------------------------------------|
|                   | Rs. per ton                       |                                    |                                        |

The duties generally represented 50 to 75 per cent in *ad valorem* terms. Further proposals for bounties were approved in 1925. The cost of protection could not be estimated but the bounties totalled Rs 2.26 crores over the three years 1924-25 to 1926-27. In 1927, the Tariff Board gave the verdict that "the decline in steel prices and the expansion of the market indicate that the protective duties have not proved burdensome, that the trade of the country has not suffered, and that no serious hardship has been caused to the producer of steel or to the general public." The new duties agreed to in 1927 were generally lower, the bounties were discontinued, and the duties allowed preferential rates to British imports. The duties were levied for seven years by which time it was hoped that Tatas would be able to withstand British but not Continental competition. In 1931-32, Tata, Indian Iron and Mysore Iron, the three principal manufacturers of pig iron entered into an agreement to fix prices, regulate output and allocate markets.

The most publicized fiscal measure of the twenties was not the imposition but the removal of a duty as an article of faith. Tariff changes in 1917 and 1921 had made the import duty on cotton piece-goods substantially higher than the excise (though the duty exemption for mill

machinery and stores had been withdrawn) but this failed to make any impact upon business sentiment and organized political opinion. The Government proposal in 1922 to raise the duty on imported piece-goods (as part of the general revision in order to cover the revenue deficit) from 11 to 15 per cent was conditional upon raising the excise from  $3\frac{1}{4}$  to  $7\frac{1}{2}$  per cent, which the Legislature declined to accept. Consequently, no change was made either in import or excise duty but a 5 per cent duty was levied on imported twist and yarn (which had been on the free list since 1896) over the protests of handloom interests. In 1925, when Bombay millowners made the withdrawal of a proposed wage cut conditional upon repeal of excise duty and received the backing of the Provincial Government, the duty was suspended by an ordinance. The remission amounted to Rs. 2 crores and did not substantially help the industry, particularly in Bombay, which suffered at least as much from internal as external competition. The Bombay mills had frittered away their resources during the war boom by distributing Rs. 50 crores as dividend between 1915 and 1922, an average of 53 per cent on paid-up capital.

Encouraged by their triumph over excise, the Bombay and Ahmadabad millowners pressed home with a demand for protection against Japanese competition. The Tariff Board was divided in its recommendations on the subject in 1927 and initially Government confined the relief to restoring the duty exemption on mill machinery and stores. Within a few weeks, however, Government agreed to subordinate its concern for handlooms and granted blanket protection till 1930 to mill yarn of counts 40 and below against Japanese competition, which was actually concentrated in the count range 30 to 50 only. In 1928 and 1929, the piece-goods market became acutely competitive for Bombay and Ahmadabad and demands were made for protection to cover piece-goods as well. Government, too, was looking for revenue to cover its deficit and did not look kindly at Japanese imports which cut into the market for Lancashire. In 1930, after the receipt of the Hardy report, a combination of specific and *ad valorem* duties was levied on imported piece-goods with a slight preference for British goods. Dey\* estimated that the new duties were equivalent to a dividend of 11 to 12 per cent on the then paid-up capital of the entire industry and that about one-half of the total sum paid by tax-payers went as bonus to producers. These rates were further enhanced twice in 1931, and raised steeply from 20 to 50 per cent on non-British goods in 1932. An industry which had grown vigorously and profitably for at least sixty years in spite of official apathy or antipathy, thus, came to depend upon protection, at least, partly because Bombay and, to a lesser extent, Ahmadabad mills were not able to withstand competition from other internal centres and which, there-

---

\**The Indian Tariff Problem*, p. 90

fore, found Japanese supplies a convenient scapegoat for covering up their mismanagement of finance and labour. Evidence of mismanagement came soon with the break-up of the Currimbhoy Ebrahim group in 1933 and the transfer or liquidation of several other mills in Bombay shortly thereafter.

Protection to the sugar industry came about largely as a result of heavy revenue duties, but the industry developed only after the Tariff Board recommended their conversion into protective duties. The import duty on sugar was 5 per cent from 1894 to 1916 when it was raised to 10 per cent, and further to 15 per cent in 1921 and 25 per cent in 1922. Three years later, the duty was made specific and was raised fairly consistently for revenue reasons through 1931, when Dey\* estimated it as equivalent to 190 per cent *ad valorem* at current prices. In spite of the heavy duty, imports nearly doubled over the twenties to about 9 lakh tonnes. The revenue from import duty rose from Rs. 53 lakhs in 1900-1901 to Rs. 870 lakhs in 1929-30, in which year Government encouraged the industry to seek protection. The Tariff Board recommended that the revenue duty (which stood at 120 per cent at the end of 1930-31) be transferred to the protective schedule for 15 years, the rate for the first 7 years to be 135 per cent and for the next 8 years 101 per cent. Government, without committing itself to the conversion, raised the rate of duty in 1931 to the level recommended by the Board. The policy underlying sugar protection was not designed primarily to help the sugar industry but to protect the interests of farmers growing sugarcane, the cultivation of which fetched the highest monetary return among all staple crops. In 1929-30, there were only 29 sugar factories producing 91,444 tonnes of white sugar. The import of sugar mill machinery in real terms increased thirty times between 1928 and 1933; sugar production was 5.69 lakh tonnes in 1932-33 and reached self-sufficiency in 1935-36 when there were 135 factories.

**Protection to Other Industries:** In 1924 the import duty on sulphur was abolished in order to help chemical manufacturers. The Tariff Board reported on paper in 1925 and concluded that sabai paper was not an infant industry; protection could be given only along with such non-tariff concessions as protection of process, patents and State guarantees for debenture issues. Government agreed to grant only protective duties for seven years but the industry was saved. Among other industries that received protection between 1923 and 1939 were printer's ink, matches, salt, heavy chemicals, sericulture, magnesium chloride, plywood and tea chests. Protection to heavy chemicals hardly served any purpose because the period of protection was only 1½ years. Magnesium chloride and plywood received only a small measure of protection.

Among the industries that were denied protection were cement (in

---

\*The Indian Tariff Problem, pp 238-39.

1925, though the conversion of *ad valorem* duty into specific in 1926 enabled the industry to satisfy 95 per cent of demand by 1936), glass and worsted woollens (because their essential raw materials were not available locally), kerosene and coal. Another industry, locomotive manufacturing, was denied protection in 1924 on the ground that the home market was not large enough.

As viewed by the Second Fiscal Commission, the basic defect in the approach of the First Fiscal Commission was that "protection was not visualised as an instrument of general economic development but was viewed as a means of enabling particular industries to withstand foreign competition." The conditions laid down by it were, moreover, interpreted rather rigidly. The result was lop-sided development with a lack of attention to the development of basic and ancillary industries.

**Effects of Protection:** While protection did impose in some cases rather avoidably high costs on the consumer, mainly because it was not aimed at general industrial development, it succeeded to a considerable extent in safeguarding the existence and expansion of the protected industries and also developed some interest in allied industries. Between 1922 and 1939, the production of steel increased eightfold from 1.32 lakh tonnes to 10.57 lakh tonnes; the production of tinplate, wire, wire-nail, engineering and agricultural implements was also encouraged. Cloth production went up from 1554.5 million metres to 3658 million metres, matches from 16 to 22 million gross, paper and paperboard from 24,385 tonnes to 68,075 tonnes and cane sugar from 24,385 tonnes to 945,942 tonnes.

Employment in protected industries grew 47 per cent between 1923 and 1937 from 580,000 to 881,000, while in unprotected industries the increase was only 24 per cent from 8,70,000 to 10,51,000. None of the protected industries suffered any setback in production during the thirties when other industries were passing through difficult times. The area under cotton and sugarcane expanded considerably.

Going by the record of protected industries, the Second Fiscal Commission observed that "the policy of discriminating protection, within its limited scope, has achieved a fairly large measure of success and that, on balance, the direct and indirect advantages to the community of protection to these major industries offset the burden on the consumers."

**External Capital:** Industrial enterprises had been, since the mid-19th century, dependent to a considerable extent on the supply of capital from abroad and those responsible for providing the capital had naturally secured a large measure of control. At the same time, the demand for industrialization was closely associated with nationalistic aspirations. As industry developed, there were apprehensions that the power of foreign capitalists was increasing. The question was discussed at length by the First Fiscal Commission which was divided on the issue; it was referred

to an External Capital Committee in 1924, consisting of the Finance Member and members of the Legislature. The Committee concluded that external capital was a valuable factor in assisting economic development and that general measures discriminating against it or penalizing it by way of taxation or control would be definitely injurious both to the development of Indian resources and the interests of Indian investors. It also recommended that where investment carried with it the control of an undertaking, certain conditions (stated below) should be applied provided that discrimination was feasible. But it considered that, where a general concession was given, *e.g.*, by a tariff, it was impracticable to effect any discrimination. On behalf of Government, Sir Atul Chatterjee stated in the Assembly on March 2, 1922, that :

"no concession should be given to any firms in regard to industries in India unless such firms have a rupee capital, unless such firms have a proportion at any rate of Indian directors, and unless such firms allow facilities for Indian apprentices to be trained in their works. This has been mentioned more than once, and I can only repeat this declaration."

The problems created by the setting up of foreign-controlled enterprises, both before and after the adoption of high revenue duties and discriminating protection, were highlighted in the thirties with the entry of international combines into the "new" industries and the frequent non-co-operation of such enterprises with the Tariff Board, in the enquiry into the woollen industry, for example.

**Unbalanced and Inadequate Growth :** In 1939, there were only 11,600 factories (each employing 20 persons and above) and the number of persons engaged in them was 17.5 lakhs. About one-half of these workers were in cotton and jute mills; engineering (including railway workshops), metals and chemicals together accounted for less than one-fifth, and Government factories employed about one-tenth. The 1931 Census disclosed that, over the preceding twenty years, the working population had expanded by 4 per cent but persons employed in industry had decreased from 17.5 million to 15.3 million or by nearly 13 per cent. The decline was marked in traditional handicrafts but the advance of modern factory industries failed to compensate for it. What were the reasons for this stagnation or arrested growth ?

What little data there are of income trends in the inter-war period indicate that per capita income hardly increased during the period; probably it declined. The total production and per hectare yields of food crops, especially rice, remained constant or declined in British India excluding Burma. The terms of trade were adverse to agriculture. Gold exports, representing dissavings, totalled Rs. 321 crores during the seven years 1931-37. Between 1928-29 and 1932-33, the value

of exports fell from Rs. 339 crores to Rs. 135 crores and of imports from Rs. 260 crores to Rs. 135 crores. Budgetary policy was orthodox: direct and indirect taxes were raised and expenditure was reduced. The total revenue expenditure of Central, Provincial and Local Governments declined from Rs. 365 crores in 1928-29 to Rs. 325 crores in 1934-35; capital expenditure of Central and Provincial Governments went down from Rs. 44 crores to Rs. 5 crores over the period. Aggregate public sector outlay in 1934-35 was Rs. 345 crores against Rs. 412 crores in 1928-29.\* Decline in purchasing power and minimization of Government purchases dimmed the prospects of industrial development which came to be based largely on substitution of imported light consumer goods behind a tariff wall which helped to create and maintain a gap between the prices and costs of finished goods.

The tariff wall had a large window in the shape of Imperial preference during the thirties, and it was partial in the sense that it was extended piecemeal and never covered the import of machinery and stores on the ground that tariffs on them would raise industrial costs. Cotton, sugar, cement and steel expanded under the umbrella of protection, statutory or informal. Their expansion did not lead to any marked growth in engineering and chemicals. The growth of engineering industry was arrested by severe retrenchment in railway\*\* and other public expenditure (the key element for the industry), and decline in coal and jute output. What demand there was for capital and intermediate goods (mainly from protected industries) was satisfied from imports which were substantially cheaper than in the early twenties; this demand was in any case subject to a ceiling set by the possibility of short term import substitution in terms of quantity and/or selected qualities. The cement glut in the thirties brought out the dangers of piercing this ceiling too rapidly.

Setting up of non-traditional industries required—understandably to a greater extent than in the planned fifties and sixties—foreign capital and skills, which were not forthcoming. British private capital was attracted to India when profits were fabulous in the jute industry during post-war years (Table I). The annual export of British capital to India increased from £14.7 millions (9% of total) in 1908-10 to £29 millions in 1921 and further to £36 millions in 1922 when it was about one-fourth of total British capital exports. The annual figure dropped to about £1 million between 1924 and 1926 and to less than £1 million in 1927. There was some revival of British investment in the thirties but the new investment was almost wholly in consumer goods—and it came from international combines :

\*K. Mukerji: *Levels of Economic Activity and Public Expenditure in India*, pp. 89-90.

\*\*The capital at charge of Indian railways rose from Rs. 831 crores in 1928-29 to Rs. 880 crores in 1936-37 while working expenses were reduced during the period from Rs. 75 crores to Rs. 70 crores. (*Indian Railways: One Hundred Years, 1853-1953*).

"In some important cases, notably the manufacture of cigarettes, matches, rubber tyres, soap, paints, and certain chemicals, these industries are branches of important firms in the United Kingdom which have decided that it is to their advantage to meet the Indian demand from works situated inside the tariff wall, and also to be in a position to claim the status of Indian origin when tendering for the requirements of Government purchasing departments."\*

As the depression took its toll of British prosperity and employment, the liberalization of policies that had been evident soon after the First World War became gradually diluted till, in the thirties, one missed any reference to the importance of basic industries and assurance of Government purchases which the Industrial Commission had stressed. Protection to politically influential industries sweetened the pill of imperial preference. No attempt was made to extract a *quid pro quo* from protected industries in the form of rationalization of management and location or to bring about backward linkage of production to intermediates and capital goods. It is fair to add, at the same time, that the few Indian business groups in existence were, on the one hand, debilitated by their misadventures and decline in profitability during the twenties and, on the other, their energy and resources were exhausted in the large expansion of sugar and cement and maintenance of cotton mills on an even keel. Not till the late thirties could the Tatas, for example, recover sufficiently from their post-war setbacks to go into chemicals and heavy engineering. Filling up of the structural gaps which the Industrial Commission had pinpointed required considerable Government initiative and assistance. Instead, Government was concerned exclusively with balancing its own budget.

The Second World War found India somewhat better prepared and equipped than during the First World War but, as compared with the level and variety of demands imposed on the economy, the situation was not very different. Cotton, jute and steel remained the principal items of war procurement, though large orders for ammunition shells gave engineering factories and railway workshops some useful experience of mass production.

The Second World War gave a considerable impetus to the development of industrial potential; its contribution to actual expansion was not equally great. In 1940, Government announced that industries started during the war would be adequately protected if they were organized on sound business lines. After an initial setback caused by stoppage of trade with enemy countries and disruption of shipping, an uptrend was established which lasted till 1945 and then petered out the very next year.

Those industries which were already in existence worked to full cap-

Source: Gopal, M. H. *The Theory of Excess Profits Taxation* (Mysore, 1947), pp. 96-7

activity often in more than one shift. New plants were added in several cases and a few basic industries were established in spite of the extreme difficulty of obtaining capital equipment. A rapid expansion of small-scale industries created new sources of supply; a variety of goods like cutlery, skewers, hand tools, taps, drains and camouflage nets and many other consumer and intermediary goods were manufactured. No precise information is available regarding the output of these small units, some of which disappeared soon after the war. The index of industrial production (1937=100) rose from 102.7 in 1939 to 120 in 1945. The major increases were under steel, chemicals, paper, paints and liquors (Table II), while jute, matches, sugar and wheat flour remained depressed. The production of major industries could not, on the whole, be said to have increased substantially though higher prices and profit margins did bring about unprecedented prosperity to industrial enterprises and their managements. Capital equipment was exposed to considerable wear and tear; maintenance and replacement were neglected. Coal and transport bottle-necks remained a serious threat to output expansion through the war.

Some of the important new industries that were set up during the war were (a) ferro-alloys like ferro-silicon and ferro-manganese, (b) non-ferrous metals and metal fabricating industries like aluminium, copper, copper-sheets, wires and cables, etc., (c) mechanical industries like diesel engines, pumps, bicycles, sewing machines, machine tools and cutting tools, (d) a few items of textile, tea and oil processing machinery, and (e) chemicals like sulphuric acid, caustic soda, chlorine, superphosphates, photographic chemicals and bichromates. Some of these new articles were produced in very small quantities.

Between 1939 and 1945, the volume of factory employment expanded from 18 lakhs to 31 lakhs while in Government factories it expanded from 132,000 to 419,000 (in 1944). The number of ordnance factories trebled and the number of employees increased from 15,000 to 100,000; the number of workshops capable of supplying engineering components rose from 600 to 1500. Output of guns and ammunition rose manifold (artillery equipment produced increased from 97 to 1,376). The monthly production of machine tools expanded from 100 in 1939 to 350-400 in 1945. By September 1941, 54 firms were licensed to manufacture machine tools and lathes, furnances, power blowers, sand blasting plant, etc. Over 280 new items of engineering stores were manufactured for the first time by 1941, ranging from small tools and machine tools to heavy calibre guns, torpedo boats and degaussing cables. Wire mesh, benzol, rubber goods, disinfectors, binoculars, lubricating oils, lead pipes and sheets, chloroform, carbonic acid, oxygen apparatus, stoves and heavy chemicals were produced for the first time. Aluminium alloy drop forgings and various high speed and stainless steels were produced for the air force.

TABLE II  
Interim Index of Industrial Production  
(1937 — 100)

|      | General Index | Cotton Textiles | Jute | Steel | Chemicals | Paper | Cement | Matches | Paints | Sugar | Wheat Flour | Distilleries and Breweries | Petrol |
|------|---------------|-----------------|------|-------|-----------|-------|--------|---------|--------|-------|-------------|----------------------------|--------|
| 1938 | 105.4         | 109.0           | 98.3 | 108.0 | 84.4      | 121.6 | 124.8  | 85.1    | 130.1  | 88.7  | 100.6       | 102.6                      | 123.0  |
| 1939 | 102.7         | 104.3           | 92.4 | 125.0 | 103.9     | 135.1 | 152.9  | 87.0    | 147.1  | 62.5  | 100.0       | 100.0                      | 120.5  |

Source Report of the Second Fiscal Commission, 1949-50, p. 21.

Power alcohol manufacture was taken up. The number of heavy automobile units assembled in Bombay rose from 11,000 in 1939 to 47,000 in 1942; armoured plate vehicles were produced in Jamshedpur, but their output was limited by the necessity of importing chassis.

Till the Japanese invasion of Burma and Assam, there was no serious attempt to develop aircraft, ship-building and automobile manufacture on the ground of certain "serious difficulties" which the invasion nevertheless, helped to overwhelm. An official technical training programme was introduced only in 1941 and then, too provided for the training spread over one year of 7,300 persons at all levels including semi-skilled workers. There was no policy for large-scale training of manpower and its utilization to the maximum advantage.

"Never within recent years," noted Tyson in 1942, "has there been any lack of capital in India or a reluctance to stake it on new and sometimes speculative projects". But the engineering industry was, not surprisingly, found to be organized on a jobbing and servicing basis; mobilizing it for mass production created problems, especially because there was a severe shortage of technicians, skilled labour and machine tools. Control of capital issues was introduced in 1943. There was no control over imports from sources other than enemy countries until May 1940; 117 commodities were under control by May 1941, but comprehensive import control was introduced only in June 1942, and the tendency even then was to cut down all imports in the same proportion. The value of machinery imported declined from Rs. 20 crores in 1939 to Rs. 11 crores in 1943. Before the American entry into the war which rendered the world supply position difficult, shipping imposed its limits.

As Prest pointed out "India was called upon to produce more manufactured goods and grow more food despite the wartime lack of raw materials, fertilizers and machinery which inevitably made these tasks even more difficult than they had been before. The major part of the industrial expansion was in a few industries, engineering, iron and steel, textiles and chemicals, most of which were highly localized. In 1939, 400 out of 800 engineering works, 37 out of 157 foundries and rolling mills, 17 out of 26 chemical works and nearly all coal mining were in the Bay of Bengal area. This meant that the local resources of skill and even unskilled labour were exhausted soon. The Japanese entry and evacuation and flight, together with demand for local military construction, aggravated the scarcity of labour. Many of the lacunae were the result of lack of foresight. "Government thought in the first year of the war that the maximum force for which India could supply equipment was 1 lakh, an Air Force of nine planes with Indian pilots was thought ambitious and the production of ships, automobiles and aircraft was dubbed impossible."

**Government Purchases, World War II :** Unlike the First World War, when the creation of the Munitions Board took more than two years, a Supply Department was set up as soon as the war broke out in September 1939. It was concerned as much with production as with purchases. The Department acted as the executive agency of, first, the War Supply Board and later, the War Resources Committee, which directed the industrial war effort in collaboration with the Eastern Group Supply Council. The Director General of Supply was at first responsible for all supplies from ordnance factories and purchases from private industry, but some of his functions were later diverted to other directorates, principally the Directorate General of Munitions which looked after metals. The general method used by these agencies until 1941, was the peace-time one of competitive tendering, but later this disappeared and contracts were placed with industry on the basis of ascertained cost and profit margins. Competitive tendering was continued for small industries. Just before the war, the Chatfield Committee had recommended a capital expenditure of Rs. 7 crores on the expansion of existing ordnance factories at the expense of the British Government. These went into production by 1942. The Roger Mission of 1940-41 surveyed the whole field of industry and recommended capital expenditure in India by the British Government of Rs. 1,235 crores on expansion and rational integration of production.

From 1939-40 to 1944-45, total defence expenditure amounted to Rs. 2,738 crores, of which Rs. 1,389 crores was recoverable from the British Government. The value of contracts placed between 1938-39 and 1942-43 exceeded Rs. 560 crores, including a little more than Rs. 11 crores on small industries. Non-munitions industries also benefited from contracts. Between 1939 and 1945, the Supply Department absorbed, among other things, 3,566 million metres of cloth out of a total output of 23,774 million metres, 43 per cent of paper output, and the entire production of woollen mills. Textiles and engineering stores accounted for 43 per cent each of Supply Department purchases between 1939 and 1941. In the first year of the Eastern Group Council's existence, India supplied 60 per cent of total war demands in the region, 64 per cent after the fall of Hong Kong and Malaya.

**Industrial Policy:** As in the First World War, Government was eager to give assurances of various kinds of assistance for post-war industrial development. In June 1941, a high level Reconstruction Committee of the Viceroy's Executive Council was appointed to draw up plans for post-war reconstruction. Soon after the publication of the Bombay Plan in 1944, one of its signatories, Ardeshir Dalal, was appointed to head the newly created department of planning and development at the Centre. The department established a number of industrial panels

consisting of officials and non-officials and, on April 23, 1945 issued a statement of industrial policy. The declared objectives of industrial development were stated to be: to increase the national wealth by the maximum exploitation of the country's resources, to make the country better prepared for defence, and to provide a high and stable level of employment. The highlights of the policy statement were as under:

- (1) About twenty major industries would be brought under the control of the Central Government.
- (2) Basic industries of national importance, namely, aircraft, automobiles, tractors, chemicals and dyes, iron and steel, prime movers, electric machinery, machine tools, electro-chemicals and non-ferrous metals, could be nationalized if adequate private capital was not forthcoming since it was essential in the national interest to promote such industries. All other industries would be left to private enterprise under varying degrees of control. Coal would be handled as a special case.
- (3) In order to regulate industrial development, the Government would have to take power to license industrial undertakings. Industrial workers would be enabled to secure fair wages and reasonable living conditions. Controls would be utilized to prevent excess profits and to ensure the quality of industrial products, etc.
- (4) Government would have the primary responsibility for assisting industrial progress through the development of transport, power, and facilities for scientific and industrial research and technical education. Government might also assist industry by helping to raise capital by tariff and taxation policy and by the procurement of capital goods from abroad.

In 1945, Government realized the importance of assisting or protecting industries during the transitional stage pending the formulation of a long-term tariff policy. An interim Tariff Board was set up for two years to investigate the claims of various industries seeking protection or Government assistance. To qualify for such cover, an industry had to satisfy the Tariff Board that:

- (a) it is established and conducted on sound business lines;
- (b) having regard to the natural or economic advantages enjoyed by the industry and its actual or probable costs, it is likely within a reasonable time to develop sufficiently to be able to carry on successfully without protection or State assistance; or
- (c) it is an industry to which it is desirable in the national interest to grant protection or assistance and that the probable cost of such protection or assistance to the community is not excessive.

The criteria laid down were more liberal than in pre-war days; the power to make recommendations on matters other than protection

gave the Board considerable flexibility of inquiry and evaluation. Besides protection and other forms of assistance, the Board was empowered to:

- (i) maintain a continuous watch over the progress of protected industries and advise Government on the modifications of protection or assistance required;
- (ii) report to Government on factors which lead to higher costs of production in India as compared with other countries;
- (iii) enquire into the cost of production of commodities and determine their wholesale retail or other prices;
- (iv) advise Government on measures required to secure internal production on the most economical cost basis;
- (v) recommend measures required for protection against dumping from abroad;
- (vi) undertake studies on the effects of *ad valorem* and specific duties and tariff valuations on various articles and the effects of tariff concessions granted to other countries; and
- (vii) report to Government as and when necessary on combinations, trusts, monopolies and other restrictions on trade which may tend to affect the industries enjoying protection by restricting production or maintaining or raising prices and to suggest ways and means of preventing such practices.

Most of these additional functions were not actually carried out. The main work of the Board consisted of investigating the claims of protection and inquiring into the cost of production of prices of articles like steel, etc. To anticipate slightly the developments which took place after 1946, the Tariff Board followed the method of equating domestic cost with the landed cost of equivalent imports to determine the quantum of protection and also allowed a margin of upto 20 per cent (generally 10 per cent) for consumer prejudice against the domestic product. In a few cases, subsidies and import restrictions were also recommended. Apart from these, it also made other recommendations covering:

- (a) placing of Government orders,
- (b) modification of capital structure of companies in applicant industries,
- (c) safeguards for companies registered in India competing with foreign companies manufacturing in India,
- (d) refund of duty on capital goods or raw materials required by the industry,
- (e) increased employment and training of Indian nationals and assistance for technical training and employment of foreign experts,
- (f) formation of manufacturers' associations and institution of joint sales organizations, and

(g) prescription of suitable standard specifications.

During the five years 1945-50, the interim Tariff Board conducted 90 inquiries, including 5 price inquiries against 51 carried out between 1923 and 1939, and Government announced its decisions in most cases within two months of the receipt of its recommendations. This was in striking contrast with the period of 3 to 24 months taken by Government to make its decisions between 1926 and 1937 after 5 to 18 months taken by the then Board to submit its report, quite apart from the delay in referring applications to the Board or outright rejections without reference to the Board.\* The interim Board recommended protection for the first time to 38 industries and continuance of protection to 22 industries. Among the important industries which received protection during 1945-50 were aluminium, antimony, caustic soda, bleaching powder, soda ash, textile machinery, bicycles, electric motors, plastics, preserved fruits, sewing machines, sheet glass, starch, and calcium chloride.

**Industries in Princely States:** The leading progressive States planned and carried out a number of enterprises during and immediately after the war. In 1940, Mysore (Karnataka), in collaboration with the industrialist Walchand Hirachand, established Hindustan Aircraft but, soon after, the Government of India bought out Walchand and took it over as an aircraft repair shop. The State also established an industrial and testing laboratory, and took up a large part of the equity of several companies established for the manufacture of matches, radio and electrical equipment, lac and paints, chrome tanning, and chemicals and fertilizers. Departmental enterprises entered into the manufacture of vegetable oils, glass, enamel, electric bulbs, porcelain, and plywood. A survey in 1951 found that the State had invested a little more than Rs. 5 crores in departmental enterprises, Rs. 84 lakhs in joint ventures with private interests and advanced loans exceeding Rs. 30 lakhs to the latter. The Mysore Iron and Steel Works which had started in 1923 with a wood distillation plant and a 61-tonnes per day capacity charcoal blast furnace had changed over to the production of steel and cast iron pipes in 1936; two years later a cement unit was added and, in 1942, a ferro-silicon plant was added.

In Hyderabad, the mining areas under Singareni Collieries (established in 1920) were further developed. After the war, the State promoted and financed a large number of enterprises for the manufacture, among other things, of machine tools and forgings, cotton, sugar, heavy chemicals, sheet glass, glucose, starch, casein, plastics, metal products, etc. By 1949, there were 43 industrial concerns in which the Government held large blocks of shares.

---

\*Report of the Second Fiscal Commission, p. 11

The Travancore Government promoted and invested heavily in companies for the manufacture of fertilizers and chemicals, sugar, rubber, cement, rayon, electro-chemicals, titanium, and timber soon after the war. It also set up departmental enterprises for the production of soap, porcelain, bicycles and an assorted variety of other goods.

While many of these enterprises became the nuclei of growth and contributed to the industrialization of the regions, the arrangements for their management, finance and marketing were not always satisfactory. Nearly all of them enjoyed guaranteed markets and various other concessions like free or cheap land, power, etc., but these in turn imposed obligations of a constricting nature. Departmental enterprises were stifled by administrative control, while private managements were not always keen to give their best since their own equity was disproportionately small. There was no over-all policy to regulate promotion, assistance and supervision; each project was taken up or aided on an *ad hoc* basis. Most of these enterprises had to be drastically reorganized in the fifties. These mistakes notwithstanding, there is no doubt that assistance and concessions from Princely States played a key role in the promotion of industrial entrepreneurship in the South, and laid the foundation for the impressive and relatively broad-based progress witnessed later during the fifties and sixties.

**Summing Up:** Pre-independence industrial policy wavered between, on the one hand, a paternalistic urge which manifested itself, during peace-time, in sporadic and fitful essays in industrial demonstration, education and unviable small direct assistance and concessions, during the two war periods in hectic procurement and liberal promises of post-war generosity and, on the other, acceptance of orthodox non-interventionist economic dogmas. The influence of British manufacturers was strong, till 1914, in the determination of tariff policy and, later, in more sophisticated direction of the course of discriminating protection and Government and railway purchases. The feelings of the Indian entrepreneurial class were assuaged with protection to cotton, sugar and steel, in which the British hold over the Indian market was being severely eroded by imports from non-sterling countries. In so far as protection led to industrialization during the twenties and thirties, a growing new market for industrial machinery was created for the benefit of British manufacturers who continued to enjoy a practical monopoly of supply of major engineering items to the railways. The engineering industry, largely British-controlled then, built itself up for repair and job functions, to which assembling of imported components was added during and after the war.

Curiously enough, both the periods — 1870's to 1890's and the late 1920's to early 1930's — in which there were something like minor and

limited investment booms coincided with world-wide decline in machinery prices. This remarkable coincidence took away what little incentive there might have been to establish machinery manufacture. A representative of Tatas stated before the Tariff Board in 1932 that financial and technical conditions were such that private industrialists were not able or inclined to enter into heavy engineering and chemicals without the promise of substantial support from Government. For its part, Government was eager to cut down expenditure and purchase commitments; guarantees of Government purchases or inducement of domestic purchases of plant and machinery at higher than import prices were unthinkable. Government production of railway, cotton and jute equipment (which had a relatively large market) would have run foul of orthodox policies and British manufacturers; production of equipment for sugar, paper and cement was ruled out, among other reasons, by the small size of the market and the once-for-all nature of the investment in these import substitutive industries. While the policy of discriminating production and high revenue duties was partial and halting, the real failure was not just of what industrial policy there was but lay in the absence of an over-all economic policy designed to arrest the decline of general purchasing power and employment opportunities and thereby to create an environment of growth. Protection could only give a shot in the arm for partial and fragmented import substitution in the short run; it could not expand aggregate demand for industrial products and create prospects of indefinite expansion.

The Indian entrepreneurial class exhausted its energies during the inter-war years in the expansion of cotton, sugar and cement. Its horizons did not stretch any wider due to lack of capital, technical skill and know-how of selling unfamiliar goods. Except for the Princely States and rich zamindars, which constituted a rather narrow and unpredictable class of long-term investors, there were no institutions to provide long-term finance for projects requiring considerable capital and likely to take a long time to earn a return from goods with uncertain sales prospects. The twenties and thirties were decades of lost opportunities mainly because Government refused to take an active and direct part in industrial development and the entrepreneurial class was distracted by the temporary — and in the long run costly — advantages of protection for consumer goods.

The pace of industrial investment, as measured by imports of "machinery and millwork", was extremely slow even after allowing for decline in import prices. Such imports averaged Rs. 5 to 6 crores a year from 1904 to 1918, rose to nearly Rs. 22 crores (when prices were inflated) in the period 1919-20 to 1923-24 and fell to about Rs. 13 crores between 1929-30 and 1936-37 (Table III). The index of all import prices declined by 37 per cent between 1927-28 and 1936-37; even on the out-

side but unrealistic assumption that machinery prices declined in the same proportion, the investment in industry during the inter-war years could hardly be described as substantial.

TABLE III  
Annual Imports of Machinery and Millwork 1899-1939

| Period/year               | Amount<br>(Rs. lakhs) |
|---------------------------|-----------------------|
| 1899-1900 to 1903-04 (av) | 2.79                  |
| 1904-05 to 1908-09 (av)   | 3.98                  |
| 1909-10 to 1913-14 (av)   | 5.61                  |
| 1914-15 to 1918-19 (av)   | 5.13                  |
| 1919-20 to 1923-24 (av)   | 21.64                 |
| 1924-25 to 1928-29 (av)   | 16.19                 |
| 1929-30 to 1933-34 (av)   | 13.36                 |
| 1934-35                   | 12.64                 |
| 1935-36                   | 13.68                 |
| 1936-37*                  | 12.76                 |
| 1937-38                   | 17.14                 |
| 1938-39                   | 19.04                 |

\*Excluding Burma.

The war squeezed out the last ounce of production from existing industrial capacity but gave little scope for expansion of capacity, particularly in areas crucial for future growth. Its main contribution lay in the building up of immense trading and industrial fortunes through price inflation and drastic curtailment of mass consumption, and in familiarizing a key section of the population with new material aspirations and goods. Barring some import of steel and a little equipment on the recommendation of the Roger Mission, no concerted effort was made to import machinery under U.S. Lend-Lease arrangements. The immediate problem for industry after the war was to make up the damage caused by excessive wear and tear and lack of maintenance. World-wide shortage of machinery and shipping, political disturbances and blocking of sterling balances made it difficult to launch any major industrial expansion soon after the war.

On the eve of independence, India was one of the top dozen industrial countries of the world, measured by the size of its industrial output. Most of this output consisted of cotton piece-goods and yarn, jute, steel, paper, cigarettes, cement, coal and sugar. There was practically no production of capital goods in 1946, India produced machine tools worth Rs. 91 lakhs, electric motors 46,000 h.p., power transformers 39,000 kva and 473 diesel engines (Table IV). Non-ferrous metals, electrical engineering, automobiles, tractors, prime movers and heavy chemicals were either non-existent or still in their infancy. The output of chemicals was nominal: sulphuric acid 60,963 tonnes (against 19,305 tonnes in 1919), and a few thousand tonnes of caustic soda, soda ash, chlorine

TABLE IV  
Production of Major Industries 1946

| <i>Industry</i>                        | <i>Unit</i>     | <i>Production</i> |
|----------------------------------------|-----------------|-------------------|
| <b>Consumer Goods:</b>                 |                 |                   |
| 1. Cotton cloth                        | m. metres       | 3,574             |
| 2. Woollens                            | th. kg.         | 122               |
| 3. Sugar                               | th. tonnes      | 9.05              |
| 4. Cigarettes                          | m. no.          | 18,879*           |
| 5. Drugs (tinctures and galenicals)    | th. litres      | 2,273*            |
| 6. Paper and paper board               | th. tonnes      | 107.7             |
| 7. Matches                             | 50 gross        | 412,000           |
| 8. Electric lamps                      | th. no.         | 6,31              |
| 9. Storage batteries                   | th. no.         | 27                |
| 10. Electric fans                      | th. no.         | 1,10              |

and bichromates. The partition fortunately left India with nearly the entire industry of undivided India (Table V). As compared with the country's resources and population, however, only the surface had been scratched. Per capita income was Rs. 200 and per capita consumption of electrical energy 9.2 kwh. Total industrial employment was 15 millions, of which 2.6 millions or less than 2 per cent of the total working population was employed in large scale factories. National income originating in factory establishments in 1948-49 (when national income was first officially estimated) was Rs. 550 crores, about 6 per cent of total national income, while small and cottage enterprises accounted for Rs. 870 crores, another 10 per cent of the national income.

## II. Industrial Policy since Independence

Industrial policy since independence has aimed at rapid growth of industry as a spearhead of all-round economic development through a vigorous and strategic expansion of public sector enterprises, unprecedented inducements for private investment and simultaneous efforts to bring about institutional changes and social reforms which would ultimately facilitate sustained industrial growth. The broad outlines of industrial policy and the demarcation between public and private sectors are stated at length in the Industrial Policy Statements of 1948 and 1956 but these provide no more than flexible guidelines for policy thinking and implementation. A comprehensive view of industrial policy has to include, besides the 1948 and 1956 statements, the programmes and priorities laid down in the Five-Year Plans, the considerable amount and variety of legislation enacted to create and strengthen the

desired institutional structure for planned development, and the administrative interpretation and implementation of all these. The last is not the least important. The texts of policy statements and laws are the results of balancing of various conflicting ideas and interests; they do not provide a comprehensive logical framework readily applicable to individual situations and problems. The policy statements explicitly accept the need for exceptions and flexibility; the laws vest considerable discretion in executive agencies.

The major role of industry, especially heavy industry, in economic development, and active State participation in and direction of industrial growth were two common elements in all programmes of development, beginning with Visvesvaraya's pioneering essay in planning in the mid-thirties, through the Royist People's Plan, the Bombay Industrialists' Plan, the Gandhian Plan, the official post-war reconstruction schemes, the reports of the Congress National Planning Committee, and, finally the report of the Advisory Planning Board under the chairmanship of K.C. Neogy in 1946. The Government's immediate concern after independence, however, was to deal with the steep fall in production levels since the termination of the war owing to shortage of raw materials and transport, backlog of equipment replacement and labour unrest. An Industries Conference attended by representatives of Central and Provincial Governments, industrialists and labour was held in December 1947, and considered ways and means of (i) utilizing the existing capacity more fully and (ii) harnessing industry to the growing requirements of the people. On the recommendation of this Conference, Government drew up an immediate plan for the provision of essential capital goods and raw materials to thirty industries, including steel, cotton textiles, cement, superphosphates, paper, drugs, machine tools, motor car batteries, and electrical motors. A coal transport committee was established in Calcutta to expedite the movement of coal from coal-fields to industrial centres. A tripartite agreement, the fore-runner of several to come, was reached on a three-year industrial truce between labour and employers. The industrial policy statement which followed in April 1948, was based largely on the recommendations of this conference. A resolution on labour-capital relations, later accepted by Government, stated:

"The system of remuneration to capital as well as labour must be so devised that, while in the interests of the consumers and the primary producers, excessive profits should be prevented by suitable methods of taxation and otherwise, both will share the product of their common effort, after making provision for payment of fair wages to labour, a fair return on capital employed in the industry and reasonable reserves for the maintenance and expansion of the undertaking."

The number of man days lost due to industrial disputes, which had

risen from 4 million in 1945 to 16.5 million in 1947, fell to 7.8 million the next year and further to 3.8 million in 1951. This achievement was greatly facilitated by the spate of arbitration awards raising wages and cost of living allowances and providing for profit sharing bonuses. Thanks to the better industrial climate and some improvement in the transport and raw material position, production in various key industries tended to revive.

**1948 Statement:** The Government Resolution on industrial policy, of April 6, 1948 (Appendix I) emphasized the need for the expansion of production as the pre-requisite for more equitable distribution. Within its limited resources and trained personnel, Government would expand its existing units and start new ones in other fields rather than acquire and run existing private units. In order to eliminate the uncertainties and fears engendered in the private sector by statements of various ministers, etc., Government declared that only atomic energy and railway transport would be State monopolies; in six industries, coal, iron and steel, aircraft manufacture, ship-building, communication equipment and mineral oils, all new undertakings would be under State auspices "except where, in the national interest, the State itself finds it necessary to secure the co-operation of private enterprise subject to such control and regulation as the Central Government may prescribe." Existing undertakings in these fields would be allowed "all facilities for efficient working and reasonable expansion" for ten years, after which the whole matter would be reviewed. Fair and equitable compensation would be paid in the event of nationalization. State enterprises will as a rule be managed through statutory corporations. "The rest of the industrial field will normally be open to private enterprise, *individual as well as co-operative*", but 18 specified industries of national importance or which require considerable investment or high degree of technical skill will be subject to Central regulation and control.

The resolution made no economic or technical distinction between cottage and small industries but promised all assistance, including protection against competition from large units, for their survival and expansion. Great stress was laid on co-operativization of these industries. "The present international situation is likely to lessen to a marked degree our chances of getting capital goods for large-scale industry, and the leeway must be made up by having recourse to small size industrial co-operatives throughout the country."

Government indicated its readiness to extend assistance to private or co-operative enterprise, in particular, by removing transport difficulties, facilitating the import of essential raw materials, imposing tariffs to prevent unfair foreign competition, and by reviewing the system of taxation to encourage saving and productive investment.

Looking back, the 1948 Statement appears to lack both vision and perspective. It was too concerned with soothing the fears of industries reeling under threats of nationalization and offering industrial labour a recognition of its rights as a partner in industry. The ten-year reprieve granted to existing private undertakings in basic industries led to more, not less, uncertainty and little was done by the State itself for some years to enter these industries. New State enterprises were confined to fertilizers, telephone cables, penicillin, machine tools, telephone instruments and steam locomotives. Private investment in steel was curbed till 1952 by prospective state entry and unremunerative prices and in cotton mills by restrictions on modernization of equipment in the name of protecting handlooms. A number of new private industries did, however, come up during the period: automatic looms, gramophone needles, aluminium powder, electric meters, miniature electric lamps, machine tools, piston rings, ball bearings, electric motors upto 70 h.p., electric transformers, scientific glassware, and machine-made glass ampoules.

State industrial enterprises, it was soon found (as the Damodar Valley Corporation got bogged down in organizational difficulties), could not work well as statutory corporations; they came to be registered as joint-stock companies. Large joint ventures with private enterprise in basic industries, which were expected to become fashionable after the flotation of Air India International in 1949 with Tata collaboration, went out of favour soon; Air India (along with domestic aviation), Hindustan Ship-building and Eastern Shipping were taken over wholly by Government after a short partnership with private interests which (Tata in Air India excepted) found the financial burdens onerous.\*

The statement betrayed absence of clear understanding of the distinctive problems and prospects of small and cottage industries, and perception of the specific fields in which co-operativization could make headway. No plans were announced for long-term finance for setting up new industries or for modernization. The setting up of the Industrial Finance Corporation did mark a step forward in this direction but, for a number of years, it financed mainly the traditional industries. In 1948, neither Government nor businessmen nor economic experts had any clear idea of the wide variety of basic engineering and chemical industries, other than basic iron and steel, required for industrial development.

**Second Fiscal Commission 1949-50:** Government appointed the Second Fiscal Commission in April 1949 to examine afresh the question of protection in the general setting of industrial development. The Commission looked upon the process of industrialization as "basically a problem

---

\*During the Third Plan, such joint ventures of the Centre with private interests were revived but almost wholly with foreign collaborators in oil-refining and explosives.

of the reorganization of the occupational pattern." Whether and how far it should take the form of cottage, small-scale and large-scale industries depended, in its view, upon:

- a. the nature of the industry,
- b. the technological character of the industry,
- c. the relative proportions of capital and labour needed for the industry,
- d. the extent to which decentralization in production in small units is economical on the basis of private and social costs, and
- e. the rate at which it is desired to effect a change in the occupational pattern.

State initiative and assistance, it recommended, should play an important part in the promotion of cottage and small-scale industries. Where no conflict existed between these sectors, programmes of development should be framed in consultation with all the interests concerned. Where, however, there is competition between large-scale industries, on the one hand, and small and cottage industries, on the other, and it is established that the latter deserve support against competition from the former, Government should take necessary steps to safeguard the position of the latter in consultation with the interests affected till such time as they are able to stand on their legs.

The Commission recommended the following order of priorities for the *public sector*:

- (i) essential defence industries;
- (ii) industries connected with the development of natural resources *e.g.*, water power, key minerals like coal and petroleum;
- (iii) public utility industries, *e.g.*, railways, power generation, etc.; and
- (iv) heavy key and basic industries which, in the absence of private enterprise, the State may have to initiate and develop;

and for the *private sector*:

- (i) increase of production in existing undertakings upto the maximum of their installed capacity;
- (ii) expansion of existing industries upto the limits of effective demand in their market with special reference wherever possible to export markets;
- (iii) establishment and development of industries which are complementary to existing industries in the public or private sector, *e.g.*, industries which manufacture the components of other industries or which carry the processes of production a stage nearer final consumption;
- (iv) establishment of such industries as are related to existing

industries and may increase the external economies resulting from the establishment of a group of connected industries; and

- (v) establishment of industries catering for a large market, internal or external, rather than those satisfying a limited or specific demand.

For the location of relatively 'foot-loose' industries, the Commission recommended reliance in the first instance upon negative measures to prevent further concentration in areas already congested, together with simultaneous positive steps to improve the attractiveness of areas which were socially more desirable for migration of new or existing industries. The Commission ended its general remarks on what it considered a realistic note:

*"Having regard to the available capital resources and technical ability, we do not think that it is possible to achieve a more intensive pattern of large-scale industrialisation than that visualized (by the Commission) . . except through a measure of austerity or regimentation which, in the circumstances of this country, we consider it extremely difficult to enforce."*

On tariff policy proper, the Commission was of the view that protection should be related to overall planning of economic development to avoid unequal distribution of the burdens of tariffs and un-co-ordinated growth of industries. It divided industries into three categories: (a) defence and other strategic industries, (b) basic and key industries, and (c) other industries. It recommended that industries in category (a) should be protected regardless of cost on national considerations. Regarding basic and key industries in the plan, the Tariff Commission to be set up with enlarged powers should decide the form and quantum of protection and lay down the terms and conditions for grant of protection or assistance and review from time to time the extent to which these conditions have been or were being complied with by the protected industries. For the third category, it laid down the following criteria:

*"Having regard to the economic advantages enjoyed by the industry or available to it and its actual or probable cost of production, it is likely within a reasonable time to develop sufficiently to be able to carry on successfully without protection or assistance and/or it is an industry to which it is desirable in the national interest to grant protection or assistance and, having regard to the direct and indirect advantages, the probable cost of such protection or assistance to the community is not excessive."*

The Commission also gave liberal clarifications of certain specific issues:

1. Local availability of raw materials need not be a necessary condition for protection so long as there are other countervailing advantages.

2. The potential export market can be taken into account.
3. Ordinarily an industry should be able to satisfy the entire domestic demand but this need not be an overriding consideration in the short run.
4. Compensatory protection to industries using the products of protected industries should be considered on merits.
5. Protection to new and embryonic industries prior to their actual establishment should be considered in those industries which require heavy capital outlay or highly specialized personnel.
6. Excise duties on protected articles should be generally avoided.
7. Price fixation of raw materials for protected industries, wherever necessary, should be done by the Centre and not by States.

A portion of the revenues collected from protective duties should be set aside in a Development Fund, out of which subsidies in lieu of protective tariffs could be given to selected industries. Quantitative restrictions should be used sparingly and temporarily. Subsidies should be preferred to tariffs where domestic supply meets only a small portion of the domestic demand and where the commodities are essential raw materials. The obligations of protected industries should mainly be with regard to prices, production, quality of production, adoption of technological improvements, research, training of apprentices and higher grades of labour and avoidance of anti-social activities.

As for stores purchases, the Commission suggested a reasonable margin of preference for domestic goods so long as they conformed to standard specifications, and a higher margin of preference to the products of cottage and small industries.

**Industries Act 1951:** Licensing and regulation of important industries were the main instruments of centralized social and economic control envisaged in the 1948 Statement. Private opposition led to delay and changing of the title of the bill from 'Industries Control and Regulation' to 'Industries Development and Regulation'. The law finally enacted in 1951 applied initially to 37 industries listed in the first schedule. Its important provisions are:

1. All existing industrial undertakings in the scheduled industries have to be registered with Government within a prescribed period.
2. No new industrial unit can be established or substantial extensions to existing plants made for a fixed investment exceeding Rs. 5 lakhs without a license from the Central Government.
3. Government can order an investigation in respect of any scheduled industry or undertaking if, in its opinion, there has been or is likely to be an unjustifiable fall in the volume of production in the industry or undertaking or if there is a marked deterioration in

quality or an increase in price for which there is no justification; a similar investigation can also be ordered in respect of any industrial undertaking being managed in a manner likely to cause serious injury or damage to consumers.

4. In the event of an industry or undertaking not carrying out the directions issued after such an investigation, Government can take over its management.

These powers have to be exercised in consultation with a Central Advisory Council. Moreover, Development Councils were to be established for maintaining the necessary liaison between the public and private sectors, for ensuring that private industry conformed more and more to the planned pattern of development, and for building up a cadre of specialists in each industry. The more important of their functions are to:

- (a) recommend targets for production, co-ordinate production programmes and review progress;
- (b) suggest norms of efficiency and reduce costs;
- (c) recommend measures for full utilization of capacity and improved working of less efficient units;
- (d) assist in distribution of controlled materials and obtaining local supplies;
- (e) promote scientific and industrial research and collect statistics;
- (f) investigate possibilities of decentralization of processes and development of ancillary, small and cottage industries;
- (g) promote training and retraining of personnel; and
- (h) undertake enquiries for advising Government.

The Act was amended in 1953 to include more industries. By that year, 10 Development Councils had been set up for various industries.

The glow of exhortations to private industry to place itself under social discipline or face the consequences became progressively dimmer as the agricultural and price situation continued to grow worse from 1948 to 1951 and industrial production failed to increase sufficiently. As the First Plan was being drawn up in 1951, the overwhelming degree of attention required for agriculture, power, transport and utilization of existing industrial capacity led to a gradual change in emphasis from control of private enterprise to its harmonious but regulated growth as an integral part of overall development. The most tangible evidence of this change of attitude was provided by the agreements signed in 1951-52, after prolonged negotiations, with the three foreign oil companies which controlled the distribution of oil products, Standard Vacuum, Burmah-Shell and Caltex, for the setting up of petroleum refineries. Government promised to exempt them from certain provisions of the Industries Act, promised not to nationalize the refineries for 25 years, guaranteed availability of foreign exchange for annual remittance of profits in

foreign exchange, permitted them to import crude from areas of their choice, exempted imports of crude oil from customs duty, authorized the companies to sell products at prices equivalent to imported prices and decided to assess their machinery imports at a specially low rate of  $5\frac{1}{2}$  per cent *ad valorem*. Many features of these agreements were to cause difficulties and call for frequent readjustments as the international oil market became steadily more competitive but their conclusion in 1951-52 implied that industrial policy was flexible enough to accommodate technically and economically useful exceptions.

**First Five Year Plan:** The philosophy of industrial policy in a mixed economy was elaborated in the First Plan:

"It is clear that in the transformation of the economy that is called for (under democratic planning) the State will have to play the crucial role . . . a rapid expansion of the economic and social responsibilities of the State will alone be capable of satisfying the legitimate expectations of the people. This need not involve complete nationalisation of the means of production or elimination of private agencies in agriculture or business and industry. It does mean, however, a progressive widening of the public sector and a re-orientation of the private sector to the needs of a planned economy."

"The distinction between the public and the private sector is one of relative emphasis; private enterprise should have a public purpose and there is no such thing under present conditions as completely unregulated and free private enterprise. Private enterprise functions within the conditions created largely by the State . . The points of interaction between private and public enterprise are multiplying rapidly . . the private and public sectors cannot be looked upon as anything like two separate entities: they are and must function as parts of a single organism."

For the duration of the First Five Year Plan, Government admitted that it had no alternative but to give the topmost priority to agriculture, including irrigation and power, largely because of the projects in hand, but also because, without a substantial increase in the production of food and raw materials needed for industry, it would be impossible to sustain a higher tempo of industrial investment. The high priority given to agricultural investment in the State programme limited the investment which the State itself could undertake in industries. Progress in this field was, therefore, to depend to a great extent on effort in the private sector, though in key and basic industries which came in the State sphere, long-term demands had to be anticipated and "in fact, supply must come first for demand itself to develop at the required rate."

In view of the high priority for agriculture and the limitation of resources even for essential defence industries, the following general

priorities were laid down in the First Plan:

- (i) fuller utilization of capacity in producer goods industries like jute and plywood, and consumer goods industries like cotton textiles, sugar, soap, *vanaspati*, paints and varnishes;
- (ii) expansion of capacity in capital and producer goods industries like iron and steel, aluminium, cement, fertilizers, heavy chemicals, machine tools, etc.;
- (iii) completion of industrial units on which a part of the capital expenditure has already been incurred;
- (iv) establishment of new plants which would lend strength to the industrial structure by rectifying, as far as resources permit, the existing lacunae and drawbacks, e.g., manufacture of sulphur from gypsum, chemical pulp for rayon, etc.

Some of the policy questions that were later to assume greater importance were touched upon. Regarding the capital vs. consumer goods controversy, it was stated that a larger supply of consumer goods had to come mainly from fuller utilization of existing capacity which could be modernized and made more efficient. As for economies of scale in industrial projects (a rather premature issue at the time), the Plan recognized that some conflicts of considerations were bound to arise but licensing under the Industries Act "should ensure an impartial consideration of all the issues involved in a substantial expansion of existing units or establishment of new ones."

Public sector industrial investment during the First Plan was targeted at Rs. 101 crores, the bulk of it in projects directly under the Centre. The main components of the programme were an iron and steel project, completion and expansion of Sindri fertilizers, integral railway coach factory, expansion of Chittaranjan Locomotive Works, machine tools and ship-building, besides relatively lighter projects like penicillin, D.D.T., and newsprint. Actual investment was Rs. 57 crores. The targets of production and actual achievement are given in Table VI

It was recognized that in the formulation and assessment of the programmes in the private sector, "it is necessary to keep in mind the fact that, in an economy which is not completely centralized, Government can influence but not determine the actual course of investment. Nevertheless, the programmes of development, as now presented are in the nature of best judgements as to what is feasible and desirable." Against the targeted aggregate gross investment of Rs. 463 crores on new projects, replacement and modernization in the private sector, actual investment came to Rs. 340 crores (Table VII). In cotton textiles and power, investment exceeded the targets. Much of the investment was in existing units, to which extent there was no question of a more balanced regional allocation of industry.

TABLE VI  
First Plan: Public Sector Production

|                            |               | Target              | Actual<br>1955-56 |
|----------------------------|---------------|---------------------|-------------------|
| 1. Pig iron capacity       | lakh tonnes   | 3.55                | nil               |
| 2. Finished steel capacity | lakh tonnes   | 1.0                 | 0.35              |
| 3. Locomotives             | no.           | 92                  | 125               |
| 4. Integral coaches        | no.           | 50                  | 20                |
| 5. Ships                   | th. GRT       | 20                  | 13                |
| 6. D.D.T.                  | tonnes        | 711                 | 289               |
| 7. Penicillin              | m. mega units | 4.8                 | 6.6               |
| 8. Ammonium sulphate       | lakh tonnes   | 3.20                | 3.31              |
| 9. Superphosphate          | th. tonnes    | 16.76               | nil               |
| 10. Newsprint              | th. tonnes    | 30.5                | 4.3               |
| 11. Cables                 | km.           | 756                 | 845               |
| 12. Telephones             | th. no.       | 50 (revised)        | 50                |
| 13. Exchange lines         | th. no.       | 35 (revised)        | 35                |
| 14. Cement                 | lakh tonnes   | 2                   | 1.80              |
| 15. Lathes                 | no.           | 1,600 (revised 200) | 77                |

TABLE VII

First Plan: Private Sector Investment

(Rs. Crores)

|                            | Target (net)     | Actual (gross) |
|----------------------------|------------------|----------------|
| 1. Cotton textiles         | 9                | 80             |
| 2. Petroleum refining      | 64               | 45             |
| 3. Iron and steel          | 43               | 49             |
| 4. Engineering             | 12               | 25             |
| 5. Chemicals and plastics  | 14               | 15             |
| 6. Cement and refractories | 15               | 18             |
| 7. Paper                   | 5                | 11             |
| 8. Sugar                   | neg.             | 15             |
| 9. Power                   | 16               | 32             |
| 10. Jute                   | —                | 15             |
| 11. Rayon and staple fibre | 15               | 8              |
| 12. Others                 | 40               | 27             |
|                            | 233 <sup>a</sup> | 340            |

Note: Actuals include expenditure on modernization and rehabilitation. Target figures are for net investment only.

\*Excludes Rs. 230 crores for replacement and modernization.

**Village and Small Industries:** The village industry programme in the First Plan was imbued with a spirit of nationalistic revivalism and village self-sufficiency. It was described as having a central place in the rural development programme and was based on the feeling that products of large-scale industry had increasingly limited the market for the products of several classes of rural artisans. In other words, these industries were considered as being the victims of competition from large industry. A Rs. 7 crore programme was drawn up for the development of such industries as oilseed crushing, soap-making, paddy husking, palm *gur*, *gur* and *khandsari*, leather, woollen blankets, hand-made paper, bee-keeping and cottage matches, besides the provision

of facilities for organization, finance, raw materials research, technical guidance, supply of equipment, and marketing assistance. Wherever a large-scale industry competed with a cottage industry (which was not clearly distinguished from a village industry as such), a common production programme was recommended to enable the latter to organize itself. While some criteria for such protection (e.g., comparison of efficiency, scope for development through small-scale methods, employment potentials, social considerations, etc.) were laid down, and controls for this purpose over large industry were envisaged, no safeguards, time limits or inquiry procedures were laid down as pre-requisites on the analogy of protection against external competition. No priorities *inter se* were recommended for various industries. One or more of the following elements could enter into the framing of common production programmes:

- (a) reservation of spheres of production;
- (b) non-expansion of the capacity of a large-scale industry;
- (c) imposition of a cess on large-scale industry;
- (d) arrangement for the supply of raw materials, and
- (e) co-ordination of research, training, etc.

All India and State Boards were set up for handlooms, *khadi* and village industries, sericulture and coir during the First Plan period. The production of certain varieties of cloth (mainly *dhottis* and *saris*) was reserved for handlooms, a cess was levied on all mill cloth to finance assistance to handlooms and *khadi*, mill printing of cloth was limited to the best year's production in the period 1949-54, and the expansion of large units' capacity for garment-making was restricted. All applications for substantial expansion of existing units or for the establishment of new large units in leather footwear and tanning industries were examined from the point of view of their effect on cottage and small units; an excise duty was also levied on large-scale leather footwear production. The excise rebate for cottage match units was enhanced. A differential excise was imposed on the washing soap industry and a subsidy given for *neem* and non-edible oils used in making soap. In certain other industries, including some types of agricultural implements, furniture-making, sports goods, slates and pencils, *bidi*, writing inks, chalks, crayons and candles, further expansion of co-operativization was, however, extremely poor except in the case of handlooms.

The main beneficiaries of this policy were handlooms (and even more powerlooms) and *khadi*. The production of handloom cloth was estimated to have increased from 678 million metres in 1950-51 to 1,325 million metres in 1955-56 (the latter was probably an over-estimate), while the value of *khadi* went up from Rs. 1.3 crores in 1950-51 to over Rs. 5 crores in 1955-56, when its production was 31 million metres.

As for small industries, i.e., small-scale units using power and/or

functioning as ancillaries to large units, it was recognized that considerable development had taken place in this field without much direction or assistance from Government but this growth lacked some of the elements that make for efficiency and stability. Apart from providing Rs. 15 crores for their development (including handicrafts and handlooms), and seeking to encourage the development of ancillaries, reliance was placed upon State purchases. It was agreed that, where basic considerations like quality, delivery date, etc., were comparable, the products of cottage and small industries would receive preferential treatment. In those items in which cottage industry had advantages over large-scale industry or had established itself as a supplier on competitive terms, orders would be placed with cottage and small units to the fullest extent before placing any orders with large units. For other products, a price preference and suitable relaxation of specifications would be allowed on merits.

The impact of these measures on actual purchases was, however, rather small. The total value of purchases made from cottage and small industries by the Directorate General of Supplies and Disposals rose from Rs. 66 lakhs in 1952-53 to Rs. 105 lakhs in 1954-55. A number of emporia and sales depots for handloom, handicrafts and village industries were established during the Plan period. Total outlay on village and small industries during the four years 1951-55 amounted to Rs. 15 crores.

**First Plan—Summing Up:** Industry was more of an appendage to rather than an important central part of the First Plan. Apart from this overriding consideration and a general recognition of the strategic role of industrialization, Government was only groping its way towards an understanding of industrial problems and the industrial needs of the community, as distinct from the acceptance of the idea of social control over the management, expansion and profits of private industry. Many of the implications of a mixed economy were as acceptable to private industry as to Government but there was no consciousness of the instruments required to integrate plan priorities with the working of the prices mechanism which continued to dominate the allocation of resources. This consciousness, though not the instruments themselves, was to come many years later. Meanwhile, Government relied on such broad measures as industrial licensing, uniform tax incentives and concessions for power, land, etc. Licensing under the Industries Act, it was soon found, belied the great expectations that were set by it, except in so far as, together with import restrictions, it created safe and sheltered markets.

The stepping up of machinery imports and private investment during the latter half of the Plan was not wholly due to un-blocking of sterling balances held in London and liberalization of import policy. It represented in large measure the response of Indian capital and enterprise

to larger Government expenditure in the aggregate, larger Government and railway purchases, together with faith in the continuity and growth of all these and of private investment and consumption. This faith proved to be amply justified.

TABLE VIII

First Plan: Major Industrial Targets and Achievements

| Item                              | Production<br>1950-51 | Additional Production<br>by Plan-end |             |
|-----------------------------------|-----------------------|--------------------------------------|-------------|
|                                   |                       | Target                               | Achievement |
| 1. Finished steel (lakh tonnes)   | 9.95                  | 6.8                                  | 3.05        |
| 2. Pig iron (lakh tonnes)         | 15.95                 | 12.8                                 | 2.23        |
| 3. Cement (lakh tonnes)           | 27.3                  | 21.4                                 | 19.3        |
| 4. Aluminium (th. tonnes)         | 3.75                  | 8.4                                  | 3.65        |
| 5. Ammonium sulphate (th. tonnes) | 47.0                  | 411.1                                | 352.3       |
| 6. Superphosphate (th. tonnes)    | 55.9                  | 127.1                                | 16.25       |
| 7. Locomotives (no.)              | 3                     | 170                                  | 176         |
| 8. Cotton yarn (m. kg.)           | 435                   | 209                                  | 206         |
| 9. Mill cloth (m. metres)         | 3,400                 | 898                                  | 1,165       |
| 10. Handloom cloth (m. metres)    | 741                   | 814                                  | 584         |
| 11. Jute mnfa. (th. tonnes)       | 837                   | 382                                  | 234         |
| 12. Bicycles (th. no.)            | 97                    | 433                                  | 416         |
| 13. Sewing machines (th. no.)     | 33                    | 59                                   | 78          |
| 14. Power alcohol (m. litres)     | 22.7                  | 59                                   | 22.7        |
| 15. Sugar (th. tonnes).           | 1,118                 | 406                                  | 772         |

**1956 Statement:** In December 1954, Parliament accepted a socialistic pattern of society as the objective of social and economic policy. In conformity with this objective, and the Directive Principles of State Policy embodied in the Constitution adopted in 1950, and the higher aspirations which were justified by the growth achieved during the First Plan, it was considered desirable to issue a new Industrial Policy Statement in April 1956 (Appendix III). The need to soothe private sector fears of nationalization was not altogether absent for (apart from the Reserve Bank which was nationalized in 1948), the Imperial Bank was taken over by the Reserve Bank in 1955 (seven years after the announcement of its proposed nationalization), and air transport and life insurance were nationalized in 1953 and early 1956, respectively.

The new policy was aimed at accelerating the rate of economic growth and speeding up industrialization, in particular, through the development of heavy industries and machine making industries, expansion of the public sector in industry and trade, and building up of a large and growing co-operative sector. The lists of industries in the 1948 resolution were elaborated and re-categorized in three schedules:

(A) Industries the future development of which will be the exclusive responsibility of the State. These included, apart from arma-

ments, atomic energy and transport, also iron and steel, heavy plant and machinery, coal and other mining, petroleum and power. All new units in these industries, except approved cases and expansion of existing private units, will be under State auspices or where collaboration with private interests is considered necessary, the State will ensure that it can guide and control the operations.

- (B) Industries in which the State will increasingly establish new undertakings but in which private enterprise will also have the opportunity to operate on its own or with State participation, *e.g.*, aluminium, machine tools, ferro-alloys, basic and intermediate chemicals, essential drugs, fertilizers, synthetic rubber, road and sea transport.
- (C) All remaining industries will ordinarily be developed through private, including co-operative, initiative but State enterprise will not be altogether excluded from this list.

Unlike the 1948 Statement, which was concerned primarily with the imposition of social discipline over the private sector, this resolution set out in somewhat great detail the positive role of the State in relation to the private sector. Besides ensuring the development of transport, power and other services, and providing appropriate fiscal and other concessions, the State also undertook to provide through institutions, as well as directly, financial aid to industries, especially to enterprises organized on co-operative lines for industrial and agricultural purposes. The idea of a ten-year reprieve before possible nationalization was dropped altogether. After reiterating the need for social and economic controls, the resolution explicitly promised freedom to expand and non-discrimination between public and private units in the same industry:

"The Government of India recognise that, it would, in general, be desirable to allow such undertakings to develop with as much freedom as possible, consistent with the targets and objectives of the national plan. When there exist in the same industry both privately and publicly owned units, it would continue to be the policy of the State to give fair and non-discriminatory treatment to both of them."

The Resolution further reiterated the policy of supporting cottage and small-scale industries on the grounds stated in the First Plan but, after narrating various measures for their protection and assistance, it emphasized the need to make these industries self-supporting and to bring about a technological transformation in them:

"... the aim of the State policy will be to ensure that the decentralised sector acquires sufficient vitality to be self-supporting and its development is integrated with that of large-scale industry. The State will, therefore, concentrate on measures designed to improve the competitive strength of the small-scale producer. For this it is essen-

tial that the technique of production should be constantly improved and modernised, the pace of transformation being regulated so as to avoid, as far as possible, technological unemployment."

Industrial estates were conceived as one of the instruments for the development of cottage and small industries, preferably on a co-operative basis.

To anticipate some major developments which took place later during the Second and Third Plan periods, it may be stressed here that, notwithstanding the ups and downs of development after 1956 and varying interpretations of the Resolution in the framing and implementation of detailed policies, the broad framework and spirit of the Resolution have been implemented faithfully. In Schedule A, existing large coal, steel and power units have been permitted and assisted to expand; the question of their nationalization which was never seriously under consideration ceased to be a practical proposition after World Bank loans were granted to private units in these industries, *inter alia*, on the undertaking from Government that they would not be nationalized. Government has, at the same time, considerably stepped up its share in the output of these three industries. In copper and manganese, existing private units, many of them foreign controlled, have continued undisturbed. In all other major industries except ship-building (from which the private interest concerned was eager to retire for financial reasons), where there were no private units to deal with, all new units have been under State auspices. A joint Government-Stanvac oil exploration project in Bengal — which proved to be a failure — was the only exception and since then there has been no foreign equity participation in oil exploration. All new oil refineries are either fully Government-owned or are under Government majority control; in both cases internal distribution of products is in the public sector.

As for Schedule B, in regard to which there has been some misunderstanding about alleged State withdrawal from certain industries, the Resolution clearly states that private enterprise will also have the opportunity to operate on its own. The private sector, in collaboration with foreign investors in several cases, has gone into aluminium, low grade machine tools, ferro-alloys, special steels, synthetic rubber, coal carbonization, chemical pulp, and essential drugs. A modicum of private interest in fertilizers, which aroused ideological controversy for some time, almost petered out when the uncertainty of profits at foreign collaboration cast its gloom. In the field of basic and intermediate chemicals and essential drugs, Government received a project report in or about 1958 from a Russian team, which also offered financial and technical assistance for the setting up of a comprehensive complex of plants. Western private influences had something to do with the emasculation of and considerable delay in this series of projects, but the

issues were not so simple as made out in certain quarters. The offer of Russian assistance did not cover all material, technical and financial aspects of the project; some of the processes offered involved either a breach of patent rights or the adoption of a relatively inferior technology; rapid changes in chemical technology due to the use of petro-chemicals, etc., created doubts about the feasibility of some aspects of the project; in some cases either the equipment or basic materials or both had to be imported from Western sources which were not willing to oblige; finally U.S.S.R. itself accepted certain international patent obligations.

**Second Five Year Plan:** The principal objectives of the Second Plan were:

- (a) a sizeable increase in national income so as to raise the level of living in the country;
- (b) rapid industrialization with particular emphasis on the development of basic and heavy industries;
- (c) a large expansion of employment opportunities; and
- (d) reduction of inequalities in income and wealth and a more even distribution of economic power.

The basic strategy of the Second Plan was stated lucidly in the Mahalanobis Draft Plan frame. The food and agricultural raw materials problem, it was believed, had approached towards a solution; the time was, therefore, ripe for a massive push to industrialization. To achieve the four-fold objectives of a high rate of growth (defined more in terms of investment than output or consumption), high employment potential, minimum foreign exchange cost over a period of time, and price stability, the Mahalanobis draft proposed concentration on the building up of heavy industry. The extra demand for consumer goods resulting from this investment was to be met in full by the expansion of cottage industries, which were assumed to have low capital and high labour requirements in relation to output. Largescale units in consumer goods industries should not expand except to the limit of their existing capacity because such expansion would (i) create a demand for foreign exchange for the import of the necessary equipment which would not be indigenously available (the new heavy industry would be building machines for machines), and (ii) create excess demand for consumer goods. This strategy was spelt out in the Plan itself as follows:

"...if industrialisation is to be rapid enough, the country must aim at developing basic industries and industries which make machines to make the machines needed for further development. This calls for substantial expansion in iron and steel, non-ferrous metals, coal, cement, heavy chemicals, and other industries of basic importance. The limitation is, of course, the scarcity of resources and the many urgent claims on them. Nevertheless, the criterion is not merely

immediate needs but the continuing and expanding needs in the coming years as development goes forward. India's known natural resources are relatively large, and in many of these fields, as in steel, for instance, she is likely to have a comparative cost advantage. It is desirable to aim at proceeding farthest in the direction of developing heavy and capital goods industries which conform to this criterion. "Investment in basic industries creates demands for consumer goods, but it does not enlarge the supply of consumer goods in the short run; nor does it directly absorb any large quantities of labour. A balanced pattern of industrialisation, therefore, requires a well-organised effort to utilise labour for increasing the supplies of much needed consumer goods in a manner which economises the use of capital. A society in which labour is plentiful in relation to capital has to develop the art and technique of using labour-intensive modes of production effectively — and to much social advantage — in diverse fields. Indeed, in the context of prevailing unemployment, the absorption of labour becomes an important objective in itself. In using labour-intensive methods, it may well be that the cost of product is somewhat higher. This entails a sacrifice which can be reduced through technical and organisational improvements. In any case, a measure of sacrifice in the matter of consumption is inevitable while the economy is being strengthened at the base. The sacrifice diminishes as more power, more transport, and better tools, machinery and equipment become available for increasing the productivity of consumer goods industries, and in the long run the community gets increasingly large returns. Meanwhile, the stress on utilisation of unutilised or under-utilised labour power alleviates the immediate problem of unemployment. Another point that may need stressing in this connection is that the use of labour-intensive methods often implies that a smaller proportion of the incomes generated is available for saving and re-investment. Steps must be taken to ensure that this does not happen on any significant scale.

"... conditions have to be created in which modern techniques can be adopted and introduced more and more in (small and cottage industries) and the transition should be orderly .. development along new lines has to be the keynote of policy. As national income increases, demands get diversified, and as power, transport and communications are developed, the scope for small enterprises of various kinds, which either cater for new consumer demands or function in a way complementary to large-scale industry, increases steadily. From the point of view of enlarging employment opportunities as well as of increasing production, these new lines of development have to be fostered energetically.

"The sector of village and small-scale industry has to be organised

more and more on co-operative lines so as to enable the small producer to secure the advantages of buying raw materials and selling his products on a large scale, of getting access to institutional credit and of utilising improved methods and techniques. An integral programme of production may in some cases work on the basis of differential taxation; in others, buying over of the product at stated prices and a state-sponsored or co-operative marketing arrangement may be needed."

The programme for expansion of industrial capacity was conceived in terms of the following priorities:

1. increased production of iron and steel and of heavy chemicals, including nitrogenous fertilizers, and development of heavy engineering and machine building industries;
2. expansion of capacity in respect of other developmental commodities and producer goods such as aluminium, cement, chemical and pulp, dye-stuffs, and phosphatic fertilizers and of essential drugs;
3. modernization and re-equipment of important national industries which have already come into existence, such as jute, cotton and sugar;
4. fuller utilization of existing installed capacity in industries where there are wide gaps between capacity and production; and
5. expansion of capacity for consumer goods keeping in view the requirements of common production programmes and the production targets for the decentralized sector of industry.

These priorities were justified at some length: (a) steel determines the tempo of progress as a whole and India has a comparative advantage in its production, (b) heavy engineering is a natural corollary to iron and steel and internal availability of machinery would remove the difficulties and uncertainties of dependence upon external aid, (c) fertilizers are essential for agricultural development, (d) cement ranks next only to iron and steel as a development commodity, and (e) modernization of equipment in cotton and jute is necessary for earning foreign exchange, but additional production in these industries should be achieved to the maximum extent possible through greater use of idle capacity to save capital resources.

The proposed outlay on village and small industries was raised substantially to Rs. 200 crores, of which Rs. 55 crores was specifically for small as distinct from cottage and village industries. The amount was distributed as shown in Table IX.

This amount was exclusive of the provision made for these industries under rehabilitation of displaced persons (Rs. 11 crores) and community development blocks (Rs. 1.5 lakhs each). The role of the Centre was restricted to all-India administrative, research and hire-purchase schemes

**TABLE IX**  
**Second Plan Outlay on Village and Small Industries**

(Rs. crores)

|                                        |    |                                              |
|----------------------------------------|----|----------------------------------------------|
| 1. Handlooms                           | 60 |                                              |
| 2. <i>Khadi</i>                        | 17 |                                              |
| 3. Village industries                  | 39 |                                              |
| 4. Handicrafts                         | 9  |                                              |
| 5. Small industries                    | 55 |                                              |
| 6. Sericulture and coir                | 6  |                                              |
| 7. General administration and research | 15 |                                              |
| Total:                                 |    | 200 (excluding working capital requirements) |

costing in all Rs. 25 crores; the remaining amount of Rs. 175 crores was in the State sector. The problems of small industries, their urban or semi-urban location, use of machines, power and modern techniques, were viewed in a separate perspective for the first time. Their performance in training for entrepreneurship was strikingly demonstrated by the manufacture of bicycle and sewing machine parts in Ludhiana. A working definition for identifying them was laid down: all units or establishments having a total capital investment of less than Rs. 5 lakhs and employing less than 50 persons when using power or less than 100 persons when not using power. Facilities for their technical, financial and marketing assistance on a basis separate from village and cottage industries and handicrafts were recommended for the first time: Small Industries Service Institutes and industrial extension centres in each State, National Small Industries Corporation for hire-purchase of equipments and marketing assistance, and industrial estates to discourage further concentration of population in large urban centres were designed specifically for their development.

Planned regional diffusion of industrial activity had received little attention in the First Plan. Only marginal deviations could be made from the compulsions of economic and technical considerations in the case of the larger industries, but the claims of relatively backward areas were nevertheless kept in view in the location of public sector projects, including steel plants. Regional patterns of development could be and were fostered for a wide range of consumer goods and processing industries. These included cotton textiles (especially spinning), sugar, light engineering such as bicycles, sewing machines, electric motors and radio receivers, re-rolling of steel and non-ferrous metals from billets and semis, moulded plastics, and processing of drugs in bulk. Cotton mills were licensed in Rajasthan, Orissa, Assam and Punjab by fixing State quotas and persuading applicants to locate in these States. New sugar factories (especially co-operatives financed by State Governments, Industrial Finance Corporation and State Bank) and distilleries

were encouraged in Andhra, Tamil Nadu, Karnataka and Maharashtra, steel re-rolling mills in Assam, Madhya Pradesh, Kerala and North Bihar, and factories for tyre and tubes, cables and electric lamps in Kerala. A synthetic rubber plant based on industrial alcohol was established in Uttar Pradesh. The decision to sell steel at a uniform price at all railheads was an important step forward in the wider dispersal of light engineering industries.

Industry claimed about 17 per cent of total public outlay in the Second Plan, as compared with 8 per cent in the First. In absolute terms, the allocation for large-scale industry was raised from Rs. 94 crores in the public sector and Rs. 233 crores in the private sector in the First Plan to Rs. 620 crores and Rs. 575 crores (latter include mining), respectively. Almost the entire public sector outlay, which actually came to Rs. 870 crores or 56 per cent of total investment in organized industry, was for development of basic industries, such as iron and steel, coal, fertilizers, heavy engineering and heavy electrical equipment. This helped to strengthen the public sector and "also to create conditions conducive to a rapid growth of medium and light industries in the private sector." The net output of factory establishments was to increase by 64 per cent and of capital goods by 150 per cent. Measured by the Index of Industrial Production (1956-100), the actual increase was about 40 per cent in the aggregate, 118 per cent for capital goods, 60 per cent for intermediate and producer goods (including mining and electricity), and 19 per cent for consumer goods.

TABLE X  
Second Plan's Major Industrial Targets and Achievements

| <i>Item</i>          | <i>Unit</i> | <i>Production target</i> | <i>Actual production</i> |
|----------------------|-------------|--------------------------|--------------------------|
| 1. Steel finished    | m. tonnes   | 4.37                     | 2.23                     |
| 2. Fertilizers : N   | th. tonnes  | 294.6                    | 111.8                    |
| P                    | th. tonnes  | 121.9                    | 55.9                     |
| 3. Textile machinery | Rs. crores  | 17.0                     | 9.0                      |
| 4. Cement machinery  | Rs. crores  | 2.0                      | 0.6                      |
| 5. Paper machinery   | Rs. crores  | 4.0                      | —                        |
| 6. Aluminium         | th. tonnes  | 25.4                     | 18.8                     |
| 7. Newsprint         | th. tonnes  | 61.0                     | 25.4                     |
| 8. Chemical pulp     | th. tonnes  | 30.5                     | —                        |
| 9. Soda ash          | th. tonnes  | 233.7                    | 147.3                    |
| 10. Caustic soda     | th. tonnes  | 137.2                    | 101.6                    |
| 11. Dye-stuffs       | m. kg.      | 10.0                     | 5.2                      |
| 12. Cement           | m. tonnes   | 13.2                     | 8.6                      |

The main industrial targets of the Second Plan which were not achieved were those set for iron and steel, fertilizers, certain items of industrial machinery (e.g., paper and cement plant machinery, heavy castings and forgings), aluminium, newsprint, raw films, chemical pulp, soda ash,

caustic soda, dye-stuffs and cement — and for most cottage and village industries which were to supply the additional consumer goods. The shortfalls were concentrated in those very industries which were crucial for future growth and price stability. Investment in most cases exceeded the targets (Table XI), largely due to price increases but partly also due to initial under-estimation of requirements, but production remained in arrears. There were specific reasons in each industry for under-fulfilment of production targets, in addition to the shortage of foreign exchange that began to be felt acutely after 1957.

TABLE XI  
Second Plan : Investment in Industry

|                                                | <i>Plan estimate</i> | <i>Actual investment</i> |
|------------------------------------------------|----------------------|--------------------------|
| 1. Metallurgical industries                    | 503                  | 770                      |
| 2. Engineering, light and heavy                | 150                  | 175                      |
| 3. Chemical                                    | 132                  | 140                      |
| 4. Cement, electric porcelain and refractories | 93                   | 60                       |
| 5. Petroleum refining                          | 10                   | 30                       |
| 6. Paper                                       | 54                   | 40                       |
| 7. Sugar                                       | 51                   | 56                       |
| 8. Textiles: (i) natural fibres                | 36                   | 50                       |
| (ii) rayon                                     | 24                   | 34                       |
| 9. Others                                      | 42                   | 115                      |
| 10. Replacement and modernization              | 150                  | 150                      |
| Total:                                         | 1,244                | 1,620                    |

**The Principal Deficiencies and Defects of Industrial Policy as Declared and Implemented:** The private enthusiasm for industrial expansion that was aroused in the latter half of the First Plan received a fresh stimulus during the Second Plan from heavy deficit financing, relatively liberal import licensing, easier availability abroad of capital goods, and liberal distribution of industrial licenses. The wide-spread urge for industrialization and the material requisites of well-being was a favourable development but neither at the fiscal and specific level nor within the planning-cum-price mechanism, were there any means in operation for the direction of private investment in accordance with plan priorities. Barring the expansion of private steel and shipping brought about primarily by massive financial assistance and assurance of demand, rather than by price incentives, the official attitude in general was that, so long as a project was in the Plan, every industry and every industrial license granted had an equal priority. Tax concessions like development rebate, tax holiday, extra depreciation, etc., were available in identical measure to nearly all industries, instead of being graded or differentiated

according to priorities. There was, similarly, no grading or differentiation in the provision of finance, power, land, materials, water, etc. While it would be quite incorrect to say that the essential industries, being subject to price and other controls, lacked incentives to expand or could not mobilize capital — since they did in fact expand and raise large amounts of capital — there was no self-correcting or planning mechanism for restricting investment or production in relatively less or non-essential industries as resources, especially foreign exchange, became more scarce than anticipated. This became quite clear after the foreign exchange crisis in 1958: adequate foreign exchange could not be found for power and import of components, spare parts and materials for essential users but imports of equipment for less essential industries were deemed to have high priority just because they were capital goods.

In the course of licensing industrial projects and later, foreign collaboration, sufficient attention was not given to the economics of optimum location and scale of production. The underlying belief was that economic concentration would be avoided by licensing a relatively large number of units in each industry, dispersed over a number of regions, each having a separate foreign collaboration from a different country as far as possible. Consequently, uneconomically small units proliferated, and burdened the economy with high capital (especially foreign exchange) costs and low utilization of capacity as the shortage of materials became more pronounced. Each collaborator tended to install a different kind of plant, spare parts of which had to be imported for a long time from the country of origin alone, and each made a separate charge for imparting his technology and skill. The country paid several times over for each such technology and skill, which could have been avoided with fewer but larger plants and a policy for the use and transfer of trained manpower. In the event, even an increase in the concentration of economic power was not avoided. In certain industries like cement, on the other hand, the policy of denying substantial expansion to large units tended to slow down the growth of output since those who received the licenses were in many cases unable to utilize them.

The Mahalanobis strategy could not be accepted in full, among other things, owing to the pressing demands for higher consumption — and consequent import of equipment for consumer goods production. Agricultural failures and higher food prices, and transport bottle-necks led to price inflation which, became, paradoxically, the only instrument, a crude and indiscriminate one, of restraining consumption, with almost no support from fiscal, monetary and direct policies. Even if these mishaps had been avoided, the strategy would not have worked so neatly as its author postulated for some of its assumptions proved to be unrealistic or premature. One of the major premises of this strategy was that cottage industries were capital-saving. This proved incorrect for

it was found in the case of the *Ambar Charkha*, to take only one example, that it required more labour as well as more capital per unit of output as compared with mill spinning and the product was not entirely suitable for handloom weaving. In spite of rebates, subsidies, freight concessions, etc., the products of cottage industries (handlooms excepted) were not acceptable to consumers on grounds of both price and quality. Given the existing technology, there was a limit beyond which the total output of each cottage industry could not increase. The organizational effort required for improved technology and marketing was also seriously under-estimated. And, to top it all, the official predilections in favour of *khadi* tended to distract attention from the promotion of intrinsically more promising industries like footwear, coir, *bidi*, handicrafts, and small establishments using power.

The public sector was expected to and did play a crucial and strategic role in raising investment and filling gaps in the industrial structure: three steel plants, lignite, ship building, fertilizers, heavy electricals, machine tools, antibiotics, cables, railway locomotives and coaches, besides large expansion in coal, railways and power, all these started the process of changing the face of the country. But the costs of nearly all of them exceeded by far the Plan estimates, and fulfilment of production targets was inordinately delayed, thereby upsetting the foreign exchange budget and the production programmes of interrelated industries. Equally serious was the failure of the public sector to develop in good time a large technical and managerial cadre and sufficient trained labour to supply its manpower requirements and, wherever necessary, to provide the necessary guidance to the private sector. The development of such a cadre was an important part of the Industrial Policy Resolution.

While the plan progressed — and more than 80 per cent of its physical targets were achieved — many of the fundamental questions of industrial planning in a mixed economy were not answered; they were, in fact, not raised at all in the context of planning as such. What level and structure of direct business taxation would ensure private investment in accordance with priorities and also offset the disincentive to efficiency and cost reduction brought about by a high statutory rate of income tax? Should a scarcity premium be attached (by means of notional or shadow pricing or through the actual price mechanism) to the use of foreign exchange, domestic capital and essential commodities and, if so, what should be the mechanism for charging this premium in accordance with changing situations and requirements? Granted the objectives, strategy and targets for individual industries, what are the non-market or quasi-market criteria for determining the priorities between them *inter se*? Finally, how is the administration of policy to combine negative fiat with positive directions?

**Third Five Year Plan:** On the eve of the Third Plan, national income (at 1960-61 prices) had gone up over the decade of planning by 42 per cent to Rs. 14,500 crores and per capita income by 16 per cent to Rs. 330. Industrial production was 94 per cent higher than in 1950-51. The share of public sector industries in the net output of organized manufacturing industries had gone up from 1.5 per cent to 8.4 per cent and much of this increase had taken place in key industries like steel, coal mining and heavy chemicals. Besides the building up of a metallurgical and chemical base for future industrialization, considerable progress had been made in industries manufacturing consumer durables, in small industries and in the modernization and re-equipment of older industries like cotton, jute and sugar, part of it from indigenously manufactured equipment.

Far-reaching gains had been secured in the industrial field but these were insufficient to make any great impact on the general condition of the mass of the population or to alter radically the structure of the economy. Over the decade, national income originating in industry at current prices rose from Rs. 1,460 crores to Rs. 2440 crores, but as a proportion of the total, the increase was from 16 to 19 per cent only, and from 6 to 9 per cent, if factory establishments alone are taken into account. Employment in manufacturing industries rose only 17 per cent but the crude index of productivity went up by 49 per cent.

The principal objective relating to industry in the Third Plan was "to expand basic industries like steel, chemicals, fuel and power, and establish machine-building capacity, so that the requirements of further industrialisation can be met within a period of ten years or so mainly from the country's own resources." Industrial production was to increase by 70 per cent over the five years (at a compound annual rate of 11 per cent) against 30 per cent for national income as a whole. About 29 per cent of total investment, public and private, against 27 per cent in the Second Plan, was allocated to industry and minerals. Total investment in industry of the public sector was targeted to increase from Rs. 960 crores (including Rs. 90 crores actual in village and small industries) to Rs. 1,245 crores (including Rs. 150 crores for village and small industries). In the private sector, the targeted increase was from Rs. 850 crores (village and small industries Rs. 175 crores) to Rs. 1,475 crores, of which Rs. 150 crores were for replacement and modernization and Rs. 275 crores for village and small industries. Proposed aggregate investment in large-scale industry, thus, amounted to Rs. 2,720 crores and in village and small industries to Rs. 425 crores.

Of basic importance in the Third Plan was the programme for the expansion of capital and producer goods industries with special emphasis on machine building, and development of managerial skill, technical know-how and designing capacity. In this programme, the public

sector was assigned a key role but the private sector was also expected to play an important part. The share of the public sector in the net output of organized manufacturing industries would rise from 8 per cent to 25 per cent and the bulk of this would comprise capital and producer goods in the fields of metallurgy, industrial machinery, machine tools, fertilizers, basic chemicals and intermediates, essential drugs and petroleum refining. The emphasis was on industries which would help to make the economy self-sustaining, and reduce as rapidly as possible the need for external assistance to purchase these goods and also permit a broadening of the export base. The production of consumer goods was also to be expanded substantially, mainly in the private sector.

The industrial plan for the period 1961-66 was governed by the overriding need to lay the foundation for further rapid industrialization over the next 15 years; at the same time, provision was made to the extent possible for meeting the demand for other manufactured goods over the next five years. Power and fuels, it was anticipated, were likely to be inhibiting factors in the first half of the Third Plan, which might entail forgoing the adoption of industrial processes which make a heavy demand on electric power, notwithstanding their attractiveness. (This fear proved misplaced largely because industrial production failed to achieve the projected growth rate.)

Without departing from the 1956 Resolution, the Third Plan laid much greater emphasis than before on the "supplementary and complementary" nature of the public and private sectors. Specific attention was drawn to the entry of the private sector into nitrogenous fertilizers "in a bigger way than in the past." In pig iron, it was proposed to allow private plants with a maximum capacity of 1.016 lakh tonnes (raised to 3.048 lakh tonnes in 1964 on reconsideration of economies of scale and production requirements) as compared with 15,241 tonnes permitted till then. Programmes for the manufacture of dye-stuffs, plastics and drugs in the private sector were envisaged to be largely complementary to the programme for manufacture of primary aromatic compounds as by-products at steel works and of organic intermediates to be undertaken in the public sector. Similarly, public manufacture of bulk drugs was to be complemented by subsequent processing in the private sector. This change in what may be described as interpretation or implementation of industrial policy resulted, in large measure, from the pace of industrial growth and diversification, both achieved and proposed, and acceptance in general terms by both the sectors of their relative places in integrated development.

Among the general considerations for fixing industrial priorities, the Plan emphasized (i) greater and more intensive utilization of existing capacity through multi-shift operation and/or installation of balancing equipment, (ii) expansion of existing plants in preference to establish-

ment of new units in the interests of quicker completion and bringing down of the investment cost of output, and (iii) accent on those projects which would earn or save foreign exchange and discouragement of those heavily dependant upon import of raw materials. Subject to these, the following priorities were laid down for programmes and projects:

1. Completion of Second Plan projects which were under implementation or were deferred in 1957-58 due to foreign exchange difficulties.

2. Expansion and diversification of the capacity of heavy engineering and machine building industries, castings and forgings, alloy tools and special steels, iron and steel and ferro-alloys and increasing the output of fertilizers and petroleum products.

3. Increased production of major basic raw materials and producer goods like aluminium, mineral oils, dissolving pulp, basic organic and inorganic chemicals and intermediates, including petro-chemicals.

4. Increased production from domestic industries of commodities required to meet basic consumer needs like essential drugs, paper, cloth, sugar, vegetable oils and housing materials.

The Plan did not fail to take into account the growing concentration of economic power in the private sector as a result of the rapid growth of large business groups which had been able to make disproportionate use of the greater and wider opportunities for investment.\* "Against the background of the goal of a socialist pattern of society," it stated, "steps would be taken to safeguard against the concentration of development in the hands of a few *entrepreneurs* "leading to complete or partial monopolies."

In the Third as in the Second Plan, care was taken, subject to economic and technical considerations, to disperse the location of new major public projects as well as expansion of existing ones. The claims of under-developed regions have also been kept in view in the licensing of private industrial projects. The progress, programmes and production targets of a number of industries have been examined from time to time with a view to securing the location of new capacity on a zonal basis. Special attention has been paid in the allocation not merely of cotton mills and light engineering industries but also of new industries like aluminium, cellulose acetate, artificial fibres, chemical processing, fertilizers and rubber tyres and tubes, to industrially backward States like Rajasthan, Uttar Pradesh, Assam and Kerala. It has been accepted as a matter of policy that each major public project should act as a nucleus

---

\*In a statement laid before Parliament, it was implicitly admitted by Government that during the calendar years 1960 and 1961, at any rate, licensing policy had, in effect, operated to the advantage of large business groups. (*Company News and News*, May 16, 1963, p. 45). This was inevitable to some extent because in the private sector these groups alone had the capacity to undertake large new projects, but such exclusive ability has been tending to get diluted of late.

growth through the establishment of industrial estates in its neighbourhood and that fully developed industrial areas with necessary infrastructure are provided in selected centres in each State.

**Village and Small Industries:** The main objectives laid down in the village and small industries programme in the Third Plan were:

- (i) to improve the productivity of the worker and reduce production costs by placing relatively greater emphasis on positive forms of assistance such as improvement of skill, supply of technical advice, better equipment and credit, etc;
- (ii) to reduce progressively the role of subsidies, sales rebates and sheltered markets;
- (iii) to promote the growth of industries in rural areas and small towns;
- (iv) to promote the development of small-scale industries as ancillaries to large industries; and
- (v) to organize artisans and craftsmen on co-operative lines.

There has thus been a clear shift in policy away from the negative and protective attitudes of earlier years in favour of a positive, intrinsically economic programme for placing village and small industries on a sound productive basis. It is clearly recognized that small industries combine the advantages of modern technology and the use of power with those of increased employment and greater opportunity for small *entrepreneurs* as well as for co-operatives. Programmes have been drawn up for the extension of Government guarantees for bank credits to small industries, enlargement of the hire-purchase scheme of the National Small Industries Corporation, larger Government purchases from small and cottage industries, and for the setting up of 300 new industrial estates against 120 sanctioned (and 60 commissioned) during the Second Plan. Regarding industrial estates, there is still an official belief that they could be the instrument for dispersion of industries away from congested areas. The record of industrial estates actually in operation, however, indicates clearly that most of the successful estates are those which are located close to large industrial centres.

This shift in policy is confirmed by the minor increase in the outlay allocated for traditional village and cottage industries and the greater concentration proposed on small industries and industrial estates: (Table XII)

Government purchases of the products of small-scale industries have increased considerably since 1951 (Table XIII). About 70 items are reserved for exclusive purchase from this sector.

**Fiscal and Allied Developments:** As foreign exchange difficulties became more serious, returns from investments in public enterprises were found small and getting delayed, and it was realized that planning

TABLE XII

Outlay on Village and Small Industries : Second and Third Plans  
(Rs. crores)

|                                      | Second Plan<br>Actual | Third Plan |

Government Purchases of Small Industry Products  
(Rs. crores)

|                                    | Total | Annual<br>average |
|------------------------------------|-------|-------------------|
| First Plan period 1951-56          | 7     | 1.4               |
| Second Plan period 1956-61         | 21    | 4.2               |
| Third Plan period (1961-Dec. 1964) | 92    | 25.5              |

and the price mechanism were not inherently antithetical but could usefully supplement each other, a number of changes in policy and policy administration were effected from 1963 onwards. Some of these concerned licensing procedures, quicker utilization of foreign aid, and removal of price and distribution controls on certain essential commodities like steel and chemicals had, therefore, a direct bearing on industrial policy. Other changes related to tax concessions, export incentives, import duties, monetary policy and large-scale financial assistance and had, at first sight, only an indirect relationship with industrial policy but were, in fact, of fundamental significance for directing private investment — and for that matter disciplining the managements of public enterprises, too — into consistency with plan priorities and the realities of pricing of scarce inputs.

Much of the licensing, estimated at about 80 per cent of the total for the Third Plan period, was completed almost *en bloc* in or about 1960. Measures were taken from 1962 to start weeding out the dormant licenses, and to list the industries in which no further licenses would be given. At the same time, on the recommendation of the Swaminathan Committee, a list of priority industries was drawn up for prompt clearance of licensing and foreign exchange formalities. There was, however, no laying down of priorities within this list or assurance of full and prompt

satisfaction of exchange requirements for equipment and materials to the industrial units concerned; in some cases, *e.g.*, alloy steel, a high priority in licensing was not matched by expeditious approval of liberal terms of foreign collaboration which were in fact allowed to some low priority industries. The period of validity of licenses for maintenance imports was extended to facilitate continuity of supplies.

The report of the Raj Committee on steel prices and distribution marked a basic change in the attitudes towards controls on the prices and distribution of scarce essential commodities. The committee expressed itself firmly in favour of using the price mechanism for rationing and rationalizing demand and as an incentive for regulating the pace of investment and pattern of production, and restricting distribution controls to the prior satisfaction of priority demands. Price and distribution controls on structural steel were lifted in 1964 and on pig iron in August 1965, and were replaced by increased excise duties to keep down demand.

From January 1963, the raising of the bank rate and subsequent tightening up of credit policies ushered in a policy of dearer money — and higher price of capital, whether borrowed or equity. The setting up of the Industrial Development Bank of India with the promise that this institution would see high priority projects through to completion was expected to cushion high priority investments against the quantitative impact of restrictive monetary policies. The raising of import duties in 1964 and again twice in 1965 as an alternative to devaluation should give a stimulus to import substitution in equipment and materials; their impact on profitability has been cushioned by substantial raising of the rate of development rebate over the entire period of the Fourth Plan for the essential industries listed in the Finance Acts of 1964 and 1965. The absence of any deliberate link between this list of essential industries and that operative for licensing purposes remains a lacuna.

For the first time since the ushering in of planning, the structure of taxation of industry, both direct and of excise duties, now contains differentiated and graded rates on a long-term basis for income tax, development rebate, and credits for additional exports and production. So far as the fiscal and long-term financial aspects of planned industrial policy are concerned, steps have been taken in the direction of integrating market criteria and plan priorities.

**Evaluation of Policy:** Post-independence industrial policy marks a clear break from pre-independence days, though the conscious adoption of a mixed economy represents a continuity of British (and pre-British) tradition. A public sector existed at the time of independence. In British India it was practically confined to major public utilities and

supply of a part of Government requirements of defence and industrial goods. A few Princely States like Mysore, Travancore, Hyderabad and some small states in Uttar Pradesh, Saurashtra and Madhya Pradesh had ventured directly or indirectly into the production of a limited variety of consumer and producer goods. This species of public sector was not part of any overall programme of industrial development; it was largely the result of various *ad hoc* and vaguely strategic considerations. The Industrial Policy Statements of 1948 and 1956 demarcated the roles of the public and private sectors and also promised official blessings for co-operativization and cottage and small industries. Industry, especially factory industry, has yet to acquire a dominant position in the economy, in terms of both output and employment, but it has climbed to a plateau from which further ascent is assured.

The plan emphasis on heavy industry since 1956 is based on a strategy of development which suits the country's requirements. No feasible alternative has been at the expense of agriculture in the sense that financial or physical resources which could or should have been devoted to agricultural development have been diverted to industry. A substantially higher rate of growth in industrial production, especially of capital and producer goods, as compared with agriculture, is fundamental to the process of development for reasons which are primarily empirical, not ideological.

The annual rate of growth of population increased from 1.33 per cent in 1941-51 to 2.16 per cent in 1951-61, and has risen further since then. The projected rate of increase of national income has, therefore, to be stepped up adequately to raise per capita income in the short run as well as to provide the sinews of faster growth in future. This could be brought about by concentrating on the production of consumer goods, which would raise the standard of living immediately, but this strategy is self-defeating because it does not provide the resources and equipment for sustained growth from within. Given the magnitude of India's requirements, foreign exchange is and will remain the most scarce input in the near future. Exclusive emphasis on consumer goods and neglect of heavy industry would necessitate continued import of even agricultural inputs like fertilizers and agricultural machinery and involve subsequently a demand for foreign exchange for the import of equipment to manufacture these items; even for purely industrial inputs the dependence upon aid would be prolonged, and most industry would continue to remain material-based. The principal deficit items in the economy are metals, machinery and chemicals and it is only when these are progressively manufactured the dependence upon aid can be reduced substantially.

An industrial licence is necessary under the Industries (Development and Regulation) Act 1951 for setting up new or additional industrial

capacity in scheduled industries covered by the Act. The exemption limit for fixed investment was Rs. 5 lakhs till the Third Plan when it was raised to Rs.10 lakhs, and further to Rs. 25 lakhs in 1964. The ostensible purposes of industrial licensing are: (a) to limit industrial capacity within the target set by the plans; and (b) to direct investment in industries according to plan priorities. The policy of industrial licensing has gone through various phases. From 1951 to 1958, licensing tended to be restricted within the plan targets, mainly because the tempo of industrial development was not very rapid and the demand for licences was not overwhelming; imports were allowed reasonably freely and new industrial projects had to face competition from imported goods, unless they obtained tariff protection. The second phase lasted from 1958 to 1961, when the foreign exchange crisis first had its effect. Imports, especially of materials and components, were restricted and Government decided to liberalize the issue of licences, whenever a case for import substitution was made. Licences were issued far in excess (in some cases 25 per cent but normally 10 per cent) of capacity targets in several industries. For example, in paper, spun pipe, steel tube, and many other industries, the licences issued by the end of 1960 were far in excess of the capacity targets set for 1965-66, on the ground that many licensees often failed to establish capacity. The effect of this policy was to make investment plans more akin to those in a free market economy but without being subjected to market discipline. In the third phase, beginning with 1962, industrial licensing again became strict, mainly owing to the growing stringency of foreign exchange, and revocation of licences was initiated. The number of licences issued was 1,363 per year during 1959-61, 1,104 in 1962, 976 in 1963 and 782 in 1964. There were 315 revocations in 1962, 204 in 1963 and 202 in 1964.

Generous and *en bloc* licensing during the period 1958-1961 for Second and Third Plan capacity targets, together with restrictive import licensing which reduced statutory protection to insignificance (Appendix IV for the list of protected industries as of March 1963), imposed great strains on foreign exchange resources and the order books of domestic machinery manufacturers. No explicit criteria have been laid down to guide licensing policies, except for the banned, restricted and priority lists published since 1962. Some conclusions can, however, be drawn from the decisions made:

1. In some industries where economies of scale operate, certain minimum size is laid down, *e.g.*, paper in the First and Second Plan Industrial Programmes, but in most other industries where also economies of scale operate, there has been no much insistence.
2. Since regional decentralization is favoured, applications for location in backward areas receive preferential treatment.

3. Licences are issued to new *entrepreneurs* in preference to existing business houses in order to broaden the entrepreneurial base.
4. To reduce monopoly power, licences are given to those applicants, including some from large business houses, who do not have any establishment in a particular industry, e.g., Birla in cement and aluminium.
5. Government has fostered consortia for the manufacture of complete industrial plants, e.g., cement, sugar and paper but the licences are issued for specific plant manufacturing only, not for general fabrication, so that, even if their capacity is versatile and idle, they cannot change over to the manufacture of other plant.
6. To reduce the strain on foreign exchange, licensees have been required in some cases to manufacture the required components or intermediates, e.g., pulp for paper, compressors for refrigerators and air-conditioners, intermediates for chemicals and pharmaceuticals, glass tubes for incandescent lamps, plastic materials for polystyrene, apart from the more generalized version of this applied to automobiles, machine tools, etc. This has led in many cases to uneconomical vertical integration and development of captive supplies at the expense of the final consumer.
7. Export obligations have been imposed on certain licensees as a condition for the release of foreign exchange for the import of plant and raw materials, and to cover the liabilities arising out of foreign collaboration.

The impact of licensing on the pace and pattern of growth has been, as observed earlier, uneven and quite often unrelated to priorities. Though investment opportunities have been far larger than the internal and external resources available, no criteria have been laid down for undertaking the manufacture of specified items according to their suitability for economic manufacture. Consequently, in many industries, the cost of manufacture has been avoidably higher than international levels. Quite often, when an item comes to be domestically manufactured, users can continue to live off their old stocks, as happened in the case of polystyrene in 1958, PVC in 1962, synthetic rubber and ball-bearings in 1964-65. Over-licensing and *en bloc* Plan licensing, instead of phased issues, have tended to slow down the actual utilization of licences due to fears of over-production. Instead of the normally expected plan criteria of maximum value added or maximum net foreign exchange saved or maximum employment provided, there have been, by and large, only *ad hoc* decisions taken "on the merits of each proposal," which inevitably lead to delays.

To return to the course of licensing policy between 1966 and 1968, Government exempted a number of industries from the licensing provisions of the Act. The exempted industries were those which did not

involve any substantial import of components or raw materials. At the same time, industries in respect of which protection to cottage and small industries was important, were not delicensed.

In 1966, Government made an announcement of policy designed to facilitate further utilization of installed capacity. Licenced or registered industrial undertakings were told they were free to diversify their production upto 25 per cent of the licenced or registered capacity without formally obtaining an industrial licence. But this was subject to certain conditions: no additional plant and machinery was installed except minor balancing equipment obtained indigenously; no additional foreign exchange expenditure was involved; and the items into which production was diversified were not reserved for the small scale sector. In a clarification in December 1967, Government said if the industries which had diversified their production, were priority industries, even imports of raw materials could be allowed for the purpose. In diversifying production, however, there should be no additional demand for indigenous raw materials.

In the early sixties, a number of studies were conducted which revealed that there had been a growing tendency towards concentration of economic power in the hands of the captains of industry in the process of industrial development. The background to these studies was the reference made by the then Prime Minister, Jawaharlal Nehru in the Lok Sabha on August 22, 1960, moving that the Third Five Year Plan draft outline be taken into consideration, he said, "It is said that the National Income over the First and Second Plans has gone up by 42 per cent. A legitimate query is made: where has this gone? To some extent of course, you can see where it has gone. I sometimes do address large gatherings in the villages and I can see that they are better fed and better clothed, they build brick houses .. Nevertheless, this does not apply to everybody in India. Some people have hardly benefited. Some people may even be facing various difficulties. The fact remains, however, that this advance in our National Income, in our per capita income has taken place; and I think it is desirable that we should enquire more deeply as to where this has gone and appoint some expert committee to enquire into how exactly this additional income that has come to the country or per capita has spread "

Accordingly, a committee headed by P. C. Mahalanobis was appointed in October 1960. One of its terms of reference was "to ascertain the extent to which the operation of the economic system has resulted in concentration of wealth and means of production".

In its Report submitted in February 1964, the Committee, among other things observed "that the working of the planned economy has contributed to the growth of big companies in Indian industry. The growth of the private sector in industry and especially of the big com-

panies has been facilitated by the financial assistance rendered by public institutions like the Industrial Finance Corporation, the National Industrial Development Corporation, etc." The Committee referred to various other measures including tax incentives and pointed out that big enterprises were evidently in a better position to take advantage of such facilities. In the use of bank credit, for industrial expansion, the main beneficiaries have been the big and medium enterprises. The Committee's conclusion was: "Despite all the countervailing measures taken . . . concentration of economic power in the private sector is more than what could be justified as necessary on functional grounds." The Committee pointedly said that industrial licensing was an important instrument for preventing the emergence of industrial monopolies "though this objective has to be constantly balanced against the equally imperative need of promoting efficiency and productivity." The Committee drew attention to its own limitations and emphasized the importance of collecting "more comprehensive and detailed information regarding the many aspects and ramifications of economic power and controls in the private sector" in order to formulate an appropriate policy.

Government, therefore, appointed the Monopolies Inquiry Commission headed by K.C. Das Gupta, a judge of the Supreme Court in April 1964. It was asked "to enquire into the existence and effect of concentration of economic power in private hands."

The Commission, distinguishing between "productwise concentration" and "countrywise concentration", pointed out that "the planned economy which the Government decided to accept for the country as the quickest way to achieve industrialisation on the right lines has proved to be a potent factor for further concentration." An important reason for concentration, in the opinion of the Commission was that "big business was at an advantage in securing the licences for starting new industries or for expanding the existing capacity. We are convinced that the system of controls in the shape of industrial licensing, however necessary from other points of view, has restricted the freedom of entry into industry and so helped to produce concentration." The Commission also spoke of the advantage which business had over small people in obtaining assistance from banks and other financial institutions as another helpful factor in the growth of concentration.

At the instance of the Planning Commission, Prof. R. K. Hazari reviewed the operation of the industrial licensing system over the First and Second Plan periods and made an Interim Report in December 1966. One of his conclusions was that the large and medium business groups enjoyed a higher ratio of approval in licensing applications as compared to others and that their share in the investment applied for and approved had tended to rise over the decade. This was specially true about certain

business houses and he named the House of Birlas as the most important of them. During a debate on this Report in the Rajya Sabha in May 1967, the Minister for Industrial Development announced that a committee would be appointed to go into the basic question of the functioning of licensing system and any advantage obtained through it by some of the larger industrial houses.

The Committee headed by S. Dutt and appointed in July 1967, was given a four-point terms of reference. It was asked to enquire into the working of the industrial licensing system to ascertain whether the larger industrial houses had in fact secured undue advantages over others, whether they were disproportionately large and whether there was sufficient justification for it. The second point was the extent to which the licences issued were in conformity with the Government's Industry Policy Resolution 1956. Thirdly, the Committee was asked to inquire whether the basic policies of the public financial institutions had resulted in any undue preference to the larger industrial houses.

The Industrial Licensing Policy Inquiry Committee, as it was called, in its report submitted in July 1969, covered the period between 1956 and 1966 and to the extent necessary developments subsequent to 1966 and during the First Plan. Meanwhile, the Administrative Reforms Commission and the Planning Commission also went into various aspects of industrial licensing policy and recommended certain important changes. Taking these into account as also the recommendations of the Dutt Committee (which spread over a very wide canvas) Government announced a modified Licensing Policy in February 1970. The new policy aims at accelerating the pace of industrial development but avoiding concentration of economic power and providing adequate opportunities and scope for medium and small *entrepreneurs*. It represents an effective and pragmatic compromise between the necessity for greater liberalization on the one hand so as to encourage small and medium *entrepreneurs* and on the other, the need for regulation and control of certain special categories of undertakings such as the larger industrial houses, foreign concerns etc.

The exemption limit for licensing has been raised from Rs. 25 lakhs to Rs. 1 crore. There is provision for substantial expansion without a licence by a maximum of Rs. 1 crore subject to certain conditions. Certain classified industries are not eligible for this exemption: (1) certain special products for which licensing is considered always necessary, products reserved for the small sector and items in the 'core' sector, which have been planned to meet the essential needs of the economy; (2) the larger industrial houses and companies with foreign majority participation where growth and expansion need to be channelled in suitable directions; and (3) exemptions have to be related to certain criteria, particularly foreign exchange. Viewed in this context, the new

licensing policy seeks to provide a framework for accelerated industrial growth consistent with social justice and overall socio-economic objectives.

The broad features of this modified licensing policy are:

1. There is a list of 'core' industries consisting of basic, critical and strategic industries in the economy. Detailed industry plans would be drawn up for them and essential inputs provided on a priority basis. A list of broad groups of industries has been drawn up for inclusion in the 'core' sector for the Fourth Plan. These are:

- (1) Agro industries and inputs:
  - (a) Fertilizers — Nitrogenous and Phosphatic
  - (b) Tractors and power tillers, pesticides (basic chemicals only)
  - (c) Rock Phosphate and pyrites
- (2) Iron and Steel:
  - (a) Iron ore
  - (b) Pig iron and steel
  - (c) Alloy and special steels
- (3) Non-Ferrous Metals
- (4) Petroleum:
  - (a) Oil exploration and production
  - (b) Petroleum refining
  - (c) Selected petro chemicals:
    - (i) Integrated petro-chemical complexes
    - (ii) D.M.T.
    - (iii) Caprolactum
    - (iv) Acrilonitrile
    - (v) Synthetic rubber
- (5) Coking coal
- (6) Heavy Industrial machinery:
  - (i) Paper machinery
  - (ii) Chemical machinery
  - (iii) Specialized machine tools
  - (iv) Rubber machinery
  - (v) Printing machinery
- (7) Ship-building and dredgers
- (8) Newsprint
- (9) Electronics:

Selected electronic components which are deemed to be in the 'core' sector are:

- (i) Resistance, fixed and variable.
- (ii) Condensers or capacitors, fixed and variable.
- (iii) Semi-conductors, including diodes, thick film, thin film and integrated circuits.
- (iv) Connectors, switches and relays.

- (v) Transmitting and receiving tubes including cathode-ray tubes.
- (vi) Sophisticated micro-wave components and antennas.
- (vii) Ferrites and magnets.
- (viii) Thermistors and varistors.

2. In addition to the 'core' sector, all new investment propositions of over Rs. 5 crores will be considered to be in the 'heavy investment' sector. Except for industries reserved for the public sector, undertakings belonging to the larger industrial houses together with foreign concerns and subsidiaries or branches of foreign companies would be expected to participate in and contribute to the establishment of industries in the 'core' and 'heavy investment' sectors.

3. In the 'middle' sector involving investments ranging from Rs. 1 crore to Rs. 5 crores, licences will be given liberally to undertakings outside the larger industrial houses. Applications with foreign exchange implications will, however, be subject to careful scrutiny. Applications from the larger business houses or from enterprises controlled by them and branches or subsidiaries of foreign companies would be considered for expansion where it is found necessary to develop a minimum economic level which would ensure greater cost efficiency or if the industries are established in industrially under-developed areas. The larger industrial houses and foreign companies would also be licensed in the middle sector if a substantial export commitment of 60 per cent or more of the new or additional production is given. The obligation will have to be achieved in 3 years. A similar obligation minimum of 75 per cent has been laid down for the small scale sector as well.

4. New undertakings or substantial expansion of units requiring investment of Rs. 1 crore or less will not need a licence under the Industries (Development and Regulation) Act. This exemption is, however, available only to undertakings or categories of undertakings which have existing assets of less than Rs. 5 crores and which (a) do not belong to the larger industrial houses, (b) do not need Rs. 10 lakhs or more than 10 per cent by way of foreign exchange for import of machinery and equipment, whichever is less, and do not require foreign exchange except for the marginal import of raw materials, components and the like, (c) are not foreign companies or branches or subsidiaries of foreign companies (such companies being those where more than 50 per cent of paid-up capital is in the hands of non-Indians or non-residents), and (d) are not included in the category of dominant undertakings.

5. The existing policy of reservation for the small scale sector will be maintained and its area extended. In respect of agro industries, preference will be given to co-operatives.

6. The 'joint' sector concept recommended by the Industrial Licensing Policy Inquiry Committee has been accepted. In future, it is in-

tended that there would be greater participation in management, particularly at policy levels, by public financial institutions in the case of major projects involving substantial assistance from them. These financial institutions would be able to exercise option for converting bonus into equity either wholly or partly within a specified time.

7 The role of the public sector has been reoriented to cover major production gaps likely to develop in the economy, particularly in short gestation and quick yielding projects, including consumer industries and intermediates.

8. The new licensing policy lays great stress on the development of export oriented industries. It is recognized as part of Government policy that industrial capacity has to be consciously built up in those fields in which India has a comparative advantage and where favourable trends are emerging in the international markets.

### III. Growth of Industries since Independence

**Large Scale Industries:** Industrial progress in the first two Five-Year Plans (1951-61) has been described as the beginning of an industrial revolution in India. Growth and diversification of industry were quite remarkable and particularly rapid during the Second Plan period. Measured by the index of industrial production (1956=100) output grew at an annual average rate of 6.3 per cent between 1951 and 1955 and 8.3 per cent during 1955-60. The average rate for the next four years (1960-64) was 8.6 per cent. With 1956 as base, production of capital goods rose from 45 in 1951 to 264 in 1964, that of intermediate goods (including fuel and power) from 71 to 212 while consumer goods, which have a weightage of as much as 53 per cent, rose from 79 to 136 only. In overall terms, organized industrial production had practically doubled during the decade. The index of industrial production had risen from 100 in 1950-51 to 194 in 1960-61,

In this ten-year period, three new steel mills, each with about a million tonne capacity were completed in the public sector and two existing steel works in the private sector had been doubled so as to bring their ingot capacity to two and one million tonnes, respectively.

The foundations had been laid of heavy electrical and heavy machine tool industries, heavy machine building and other heavy engineering equipment. Production of machinery for the cement and paper industries had begun for the first time. There were spectacular increases on a wide front in the field of chemical industries leading not only to larger units and greatly increased production of basic chemicals such as nitrogenous fertilizers, caustic soda, soda ash and sulphuric acid, but also to the manufactures of several new products as for example: urea, ammonium phosphate, penicillin, synthetic fibres, industrial explosives, polythylene, newsprint and dye-stuffs. The production of many other

industries increased substantially. Of these may be mentioned bicycles, sewing machines, telephones, electrical goods and appliances, textile and sugar machinery, petroleum, non-metallic minerals, footwear, etc.

In spite of these far-reaching gains and impressive growth, the achievements have not been adequate enough to make any great impacts on the general condition of the masses of the population or radically to alter the structure of the economy. Compared with the targets set, there have been some large shortfalls. The combined output of steel by the three new public sector steel plants was only 0.6 million tonnes in 1960-61 as against the target of 2 million tonnes. Similarly in the private sector Tata Steel Mill the actual output of saleable steel for the Second Plan period was only 4.5 million tonnes as against 5.2 million tonnes forecast by the Tariff Commission. In the field of fertilizers there were delays in the completion of the projects followed by teething troubles. Delays occurred in the Electrical Plant at Bhopal mainly due to foreign exchange difficulties. The Heavy Machinery, the Mining Machinery and the Foundry Forge Projects were far behind schedule in the initial stages of construction. These and other projects showed that the gestation period, especially in heavy engineering industries, was generally longer than expected.

The main industrial targets which have not been achieved were those set for iron and steel, fertilizers, certain items of industrial machinery such as paper and cement plant machinery, heavy castings and forgings, aluminium, newsprint, raw fibres, chemical pulp, soda ash, caustic soda, dye-stuffs and cement. The shortfalls were in those very industries which were of crucial importance and whose economies of benefits were taken into account at the beginning of the Third Five Year Plan (Table XIV).

TABLE XIV  
Production Targets for 1960-61 and Performance

|                            | Unit           | Production Targets | Production Actually |
|----------------------------|----------------|--------------------|---------------------|
| 1. Finished steel          | million tonnes | 4.3                | 2.2                 |
| 2. Nitrogenous fertilizers | 000 tonnes     | 295.0              | 112.0               |
| 3. Phosphatic fertilizers  | 000 tonnes     | 122.0              | 56.0                |
| 4. Textile machinery       | Rs. crores     | 17.0               | 9.0                 |
| 5. Cement machinery        | Rs. crores     | 2.0                | 0.6                 |

\*Revised to 10—11 million tonnes in May 1958.

Most of the other targets of capacity and production were approximately fulfilled and in some cases exceeded as, for example, power driven pumps, diesel engines, electric motors, ACSR cables, electric fans, radio receiving sets and sugar.

The Planning Commission reported that, broadly speaking, industrial advance had been in keeping with the avowed object of enabling the economy to reach, as soon as possible, the stage of self sustaining growth, for, despite the shortfalls, notable progress had been achieved in the capital goods industries.

**Set-back In Growth:** A period of eight years comprising the Third Plan and three Annual Plans impressed a markedly uneven industrial growth. In the first four years, conditions were relatively favourable but the following three years were a period of considerable stress and strain in the economy. The growth rate declined first slowly and then steeply till it reached a stage of virtual stagnation. The index of industrial production (1960 as base) stood at 8.2 per cent in 1961-62, 9.6 per cent in 1962-63, 9.2 per cent in 1963-64 and 8.8 per cent in 1964-65. Deterioration set in thereafter and the index fell to 5.3 per cent in 1965-66, 0.2 per cent in 1966-67, and 0.5 per cent in 1967-68. The set-back, among other causes, was due to low rates of growth in textiles and food industries on the one hand and metals and machinery industries on the other. In many of these industries, there was a fall in absolute output. In 1968-69, however, there was a sharp recovery and industrial production recorded a rise of 6.2 per cent.

Of the several causes that led to the decline from 1964-65, the most important were the dislocation caused by the India-Pakistan conflict in 1965 and two successive draughts. Many industries were severely affected by the shortage of raw materials and components because of the stoppage of external aid in 1965. Although aid was resumed later on and the import policy for raw materials liberalized after devaluation, new factors added to the difficulties. The two bad agricultural years led to considerable decline in savings, investments and purchasing power. Agricultural raw materials for industrial production were in short supply.

On the other hand, completion of projects added to capacity. But subdued demand accumulated the unutilized capacity in many industries, especially in the capital goods industries. Although imported raw material position was easy, depressed demand prevented full exploitation of industrial potential. The inflationary environment and the increase in the cost of projects as a result of devaluation led to serious problems. To some extent, the position was relieved by a determined effort to find markets abroad.

Agricultural production improved in 1967-68 and consequently industrial production and investment showed an upward trend. The improve-

ment in agriculture was maintained in 1968-69 and capacity utilization in many industries also improved. Production in some industries like machine tools and cables remained at comparatively low levels but the better utilization of capacity in them is dependent on the increase in the tempo of investment.

Despite these set-backs, there has been much contribution to a diversified industrial structure. Substantial capacity has been created in many new lines. Several large projects initiated earlier, have gone into production and this has helped in the expansion of capacity, through indigenous effort in vital sectors like iron and steel, mining and power generation. Virtual self-sufficiency has been achieved in the supply of equipment and rolling stock for rail and road transport and communication. There has been appreciable increase in the production capacity of steel and non-ferrous metals. Capacity is being expanded in petroleum, fertilizer and petro-chemical industries. In many industries, it would be possible by a fuller utilization of existing capacity to achieve higher levels of production in the Fourth Plan. Design and engineering capabilities have been expanded. Process technology has been either acquired or developed to enable the planning, designing and construction of industrial projects with maximum indigenous efforts in fields like fertilizers, rayon and dissolving pulp.

The industrial policy over the years has undoubtedly fostered growth and has created a strong and sophisticated industrial base. At the same time certain inherent shortcomings and difficulties have surfaced. Experience has shown that it was not possible to ensure adequate phasing of targets of production laid down in the Plans and to review them periodically for adjustments as changing situations required. Consequently in certain industries capacity in excess of requirements was created while in some others capacity fell short of needs. The bunching of licensing and inadequate implementation led to imbalances in some sectors of industry. In some cases, though licences were issued to the full extent of requirements and sometimes even more, actual manufacturing capacity that was created fell far short. Detailed controls put considerable strain on administrative machinery and also delayed implementation and did not always secure the desired objectives. The private sector displayed inadequate cost consciousness and had no appreciation of the imperative of reducing costs because of the existence of a sellers' market in India.

**Recent Industrial Production Trends:** In 1970-71, the economy generally maintained its overall momentum of growth. In certain areas, the economy showed an encouraging improvement over the previous years' performance. In other areas, however, there were signs of certain disturbing trends emerging.

The national income in real terms grew at an estimated rate of 5 to

5.5 per cent for the second successive year strictly in line with the Fourth Plan target. To a large extent, this rise was due to a 6 per cent growth rate achieved in agriculture, and in turn, to an 8 per cent growth rate in foodgrains production (109.5 million tonnes). Wholesale prices continued to be under pressure throughout the year and reached an increase of 3.1 per cent during 1970-71, slightly lower than 4 per cent recorded during the previous year. This stabilizing trend was reflected in a welcome decline of 2.4 per cent in the prices of foodgrains and of 5.1 per cent in the prices of industrial raw materials.

Exports during the year registered an 8.3 per cent increase as against 4.1 per cent in 1969-70. Imports, however, increased by 2.9 per cent during the year as against a steep decline of 17.1 per cent in the previous year.

The general index of industrial production at 180.8 for the year 1970 reveals a rise of 4.8 per cent over the previous year as compared with 7.1 per cent rise in the 1969 over that of 1968. It would appear that industrial revival that succeeded the recession years of 1966-68 has since been followed by a deaccelerating industrial trend in 1970.

The index of industrial production in 1970 by groups and sub-groups shows that apart from "electricity generated" which showed a rise of 11 per cent and "mining and quarrying" which managed to maintain its production levels, the major group "manufacturing" showed a growth rate of 4.4 per cent.

The major growth leaders in the group "manufacturing" recorded an increase of between 12 and 19 per cent. These are manufacturers of aluminium, copper, food, miscellaneous and electrical machinery.

Industrial groups that have maintained a reasonably healthy growth rate, between 4 and 10 per cent include jute textiles, chemical manufacture, non-metallic minerals, paper products, beverages and tobacco, petroleum refinery products, non-electric machinery, written textiles and metal products.

Areas where production levels have either declined or have just been maintained include iron and steel, cotton textiles, footwear, wood and cork products, leather and fur products, rubber products and transport equipment.\*

---

\*Note: While 'textile manufacture' has been assigned a weight of 27 per cent in the index of industrial production, the item 'cotton textiles' carries a weight of 21 per cent. As a result, comparative stagnation in the production of cotton textiles tends to pull down the entire general index.

Similarly, the item "iron and steel" carries a weight of 6 per cent in the general index and a percentage decline of 6.9 per cent in production has affected the production of a number of steel based industries

In the case of items such as "footwear" and "rubber products", the relative stagnation or decline in production could be ascribed to statistical reasons. Some of the industrial units borne on the registers of DGTD have been transferred to those of the small scale sector.

**Remedial Measures:** Several steps have been taken to improve the rate of industrial production. Licensing of capacity, both for setting up new capacity and for expansion of existing units, has been accelerated. Procedure has been streamlined to permit consideration of future applications. The total number of industrial licences and letters of intent (as stated earlier) has gone up. In addition, the facility to set up industrial units without industrial licensing for units upto Rs. 1 crore of investment (as also expansion schemes involving upto Rs. 1 crore per unit with capital of less than Rs. 5 crores) subject to certain constraints of foreign exchange is expected to lead to the creation of additional capacity and thus lead to rapid growth of industrial production.

The pace of licensing of import of capital goods has also been speeded up as the figures below will show:

TABLE XV

## Value of Import Licence

(Rs. crores)

|         | (Rs. crores) |
|---------|--------------|
| 1964—65 | 303.39       |
| 1965—66 | 170.22       |
| 1966—67 | 412.46       |
| 1967—68 | 164.67       |
| 1968—69 | 83.83        |
| 1969—70 | 73.20        |
| 1970—71 | 127.09       |

Further, licensing of import of industrial raw materials has been significantly stepped up. The total volume of import licensing has gone up by 27 per cent in 1969-70 as compared to 1968-69. During 1970-71, import licencing increased by a further 35.5 per cent. The policy on import of steel has been specially liberalized to meet the shortage.

In the small scale sector, the policy of licensing of imported raw materials has been particularly liberalized. Entitlement of non-ferrous metals, for example, was increased by 50 per cent across the board in 1970-71. Also small scale units have been allowed an increased entitlement by 25 per cent of import of all categories of mild steel. The

growth of the total volume of import licensing for the small scale sector is given in the table below:

TABLE XVI  
Import Licences for Small Scale Sector, 1964-71

|         | (Rs. in crores) |
|---------|-----------------|
| 1964—65 | 17.64           |
| 1965—66 | 4.40            |
| 1966—67 | 74.09           |
| 1967—68 | 49.77           |
| 1968—69 | 36.72           |
| 1969—70 | 65.57           |
| 1970—71 | 83.26           |

These figures are exclusive of release to the small scale sector through canalizing agencies like the State Trading Corporation, the Minerals and Metals Trading Corporation and Hindustan Steel.

**Small Scale Industries:** There was some development of modern small scale industries, especially in engineering, during the Second World War but, after the cessation of hostilities, the units could not adapt themselves to the changed needs. Some degree of revival took place during the First Plan period: manufacture of sewing machines, bicycles and storage batteries was taken up and capacity was expanded in certain other items like agricultural machinery, leather tanning, radio receivers, bifurcated rivets, furniture, small tools, sports goods, etc., in which the expansion of large industry was restricted partly as a measure of policy. Development was more rapid during the Second Plan, when many units came to produce articles requiring a high degree of technical skill like plastics and some chemicals. Production of radio amplifiers, transistor radios, radio components, tape recorders, simple optical lenses, etc., was taken up. As small scale industry took increasingly to import substitution, there was even a demand for foreign collaboration in such items as minor electrical apparatus, electronic instruments, water meters, engine valves, textile accessories, clock-work, toys, tungsten carbide dies and non-engineering items like glass fibre, adhesives, glass tubes, laminating processes, etc. Government approved phased common production programmes in some industries like refrigerators, water coolers, air conditioners, photo flash bulbs, clocks and watches, and scientific instruments.

The maximum growth of small scale industries has taken place largely over the last decade. They comprise enterprises with an investment of Rs. 7.5 lakhs in machinery and equipment. They use modern equipment and techniques of production and management. Not only have small scale industries grown in numbers, the products of many of them conform to standards and specifications prescribed by the Defence

Services, railways and several large scale industries. A number of small scale units supply parts and components to large industries engaged in the manufacture of machine tools, bicycles, automobiles, coach building and other railway equipments, and electronic and electrical appliances and machinery. Products of some of these industries are exported. Several new items, parts and components requiring high technology and precision are made in this sector thus minimizing their imports.

Small scale industries have been assigned a vital role in our development strategy for three main reasons which have assumed social and economic importance in recent years. Firstly, this sector can provide employment opportunities for surplus labour force at a relatively smaller capital cost. Secondly, small scale industries are useful and effective for mobilizing untapped scarce resources of capital and entrepreneurial skill. Thirdly, these industries are expected to ensure the diffusion of productive industrial activity in order to (a) accord concentration of industry leading to flow of population to metropolitan cities causing socio-economic and political maladies of concentration, (b) create employment opportunities in areas where large additions to labour force accrue year after year and foster balanced development of all parts of the country and (c) promote progressive rural economy through the establishment of economic and functional links between the rural or semi-urban areas and the cities.

In 1960-61, there were 36,109 small scale industrial establishments in the country (Table XVII). As the decade progressed they increased more than five times and in 1969-70 they stood at nearly two lakh units: machines valued at over Rs. 40 crores were supplied on hire-purchase terms in 1969-70 (Table XVIII). As at the end of March 1970, ten thousand parties were given hire-purchase facilities — indigenous machinery worth Rs. 16.6 crores and imported Rs. 23.6 crores. More than 19,000 small scale units have been listed for exclusive purchase by Government of 166 items made by the small scale sector. Between 1956 and 1959 the number of such reserved items was barely 16 (Table XIX). The value of contracts given to the small scale sector by the Directorate General of Supply and Disposal at the end of March 1970 was made Rs. 182 crores spread over fifteen years. In addition the railways purchases made for Rs. 16 crores.

As at the end of March 1970, the Small Scale Sector (both factory and non-factory) gave employment to 63 lakh people for a gross output valued at Rs. 3,670 crores and an investment of Rs. 450 crores.

By the end of March 1970, there were 389 industrial estates all over the country. In 1960-61 there were only 66. Of the 389 industrial estates 303 were functioning and they contained 5,413 work-sheds. Their output in the year 1969-70 was worth Rs. 100 crores and employed over 96 thousand people.

**TABLE XVII**  
**Registered Small Scale Units**

| <i>Year</i>    | <i>No. of Units</i> |
|----------------|---------------------|
| 1961           | 36,109              |
| 1962           | 52,241              |
| 1963           | 74,857              |
| 1964           | 92,583              |
| 1965           | 1,06,883            |
| 1966           | 1,21,619            |
| 1967           | 1,36,273            |
| 1968           | 1,61,865            |
| 1969           | 1,78,210            |
| 1970           | 1,93,131            |
| 1971 (31.3.71) | 2,14,004            |

**TABLE XIX**  
**Items for Exclusive Purchase by Government from Small Scale Sector**

| <i>Year</i> | <i>No. of Units</i> |
|-------------|---------------------|
| 1956—59     | 16                  |
| 1959—61     | 27                  |
| 1961—62     | 46                  |
| 1962—63     | 63                  |
| 1963—64     | 70                  |
| 1964—66     | 72                  |
| 1966—67     | 84                  |
| 1967—68     | 110                 |
| 1968—69     | 122                 |
| 1969—70     | 146                 |
| 1970—71     | 166                 |

The spectacular progress of small scale industries is a tribute to the initiative and grit of the newly rising class of *entrepreneurs* from hitherto trading and agricultural interests and the systematic and positive efforts of Government to encourage them. Their growth has been greatly assisted by the availability of financial assistance from the National Small Industries Corporation, the State Bank of India, the fourteen nationalized banks, State Financial Corporations and State Governments.

The NSIC scheme for hire-purchase of machinery was introduced in 1956 and came into operation in 1957-58. Under the scheme NSIC supplies, plant and equipment against a small earnest money deposit, the balance being recovered in instalments spread over a period of 7 to 10 years on a lower rate of interest than the prevalent bank or market rate. The formalities of assessing the creditworthiness of the applicant and asking him to provide sureties are dispensed with.

Another important sphere of activity of NSIC is the training of artisans and skilled workers at its Prototype Production and Training Centres where they are provided with free hostel accommodation and are paid stipends for the duration of their training. More than 4,000 trainees have so far passed out of these training centres after rigorous in-plant training in several engineering trades.

A special scheme has been in force for over a year to encourage exports in the small scale sector. Manufacturing units exporting more than 10 per cent of their production are eligible for priority issue of licences and for preferred sources of supply for import of raw materials and components. Under this scheme, 447 units qualified for preferential treatment in the year 1970-71. They had produced goods worth Rs. 66.47 crores and the value of their exports was Rs. 22.25 crores during the previous year. Of this export total, as much as one quarter was contributed by 10 units. Twenty-nine units had exported their entire production during the year. These industries are tabulated below:

TABLE XX

| <i>Industry</i>                                             | <i>Number of Units</i> |
|-------------------------------------------------------------|------------------------|
| Curry powder, pickles, pine-apple juice and jam             | 1                      |
| Woollen hosiery and knitwear                                | 3                      |
| Readymade garments                                          | 3                      |
| Printed books, periodicals, journals, etc.                  | 1                      |
| Drugs and pharmaceuticals, medicines etc.                   | 1                      |
| Agarbattles and dhoop                                       | 4                      |
| Brass utensils, brass artware and sports cups               | 8                      |
| Agricultural machinery and implements                       | 1                      |
| Car radios, aeriols, amplifiers, etc.                       | 1                      |
| Automobile parts and accessories                            | 2                      |
| Surgical instruments and equipments                         | 1                      |
| Plastic products, plastic bangles, imitation jewellery etc. | 1                      |
| Sports goods                                                | 2                      |

In the final analysis, 69 units out of the total 447 units exported over 80% of their production, 86 units between 50 and 80 per cent and the remaining 292 units between 10 and 50%.

**Auxiliary Industries:** The auxiliary programme has gained momentum in recent years as feeders for the larger units. They need sophisticated plant and machinery to meet the requirements of the units they serve. In view of this, the upper limit of investment for auxiliaries has been fixed at Rs. 10 lakhs for plant and machinery. In 1970-71 there were 10,000 such units supplying parts and components regularly to about 200 large industries. The total investment in these small auxiliary industries is estimated at Rs. 300 crores and the value of their products at Rs. 32 crores in 1970-71. There were about 600 auxiliaries feeding the automobile industry alone. About 980 types of end products required for 16 large industrial groups are covered by auxiliaries.

In addition, nearly 280 units were engaged in production for feeding 21 public sector undertakings and the value of their output was Rs. 7.35 crores. Fifty-one units were effectively functioning in one centre of Hindustan Machine Tools supplying 50 per cent of components. In terms of import substitution the output of auxiliary industries was valued at Rs. 1.32 crores. Auxiliaries have provided employment to about one hundred thousand persons. The centres of concentration of auxiliary units are in Bangalore, Bombay, Delhi, Ranchi and Madras and scattered in other parts of the country.

There are roughly 1,000 large scale units in the private sector and 60 established in the public sector which still remain to be tapped by auxiliary industries in the small scale sector.

#### **Groups of Industries Supplied by Auxiliary Units**

1. Industrial machinery.
2. Agricultural and earth-moving machinery.
3. Machine tools.
4. Industrial, scientific and mathematical instruments (mechanical)
5. Locomotives and rolling stock, ships and aircrafts.
6. Bicycles.
7. Boilers and steam generating plants.
8. Steam engines, turbine and internal combustion engines.
9. Automobiles.
10. Commercial office and house-hold equipment
11. Electrical machinery, equipment and appliances.
12. Tele-communication equipment.
13. Industrial instruments (electrical).
14. Radio and electronic equipment.
15. Air conditioners and cold storage equipment including refrigerators.
16. Minerals, oil and petroleum industry.

**Industrial Co-operatives:** Cottage and small industries in the co-operatives sector have been given an important place in the overall scheme of industrial development. They get various types of assistance by way of imported and scarce indigenous raw materials, finance for block and working capital and participation of State Governments in their share capital.

The number of co-operatives in the industrial sector in 1970 was estimated at 51,000 with a membership of 37 lakhs and a working capital of about Rs. 370 crores. One hundred and sixty-five were in the medium and large industrial sector — 68 textile mills, 84 sugar factories, 6 vegetable oil and *vanaspati* factories, 4 milk product institutions and 3 manufacturing other food articles.

Of the total, 47,970 were industrial co-operatives organized by artisans, craftsmen, workers, etc. These institutions either undertook production and sale activities or offered supply, sale and other services to their members. Membership of such societies totalled 31.86 lakhs and the number of employed were 8.10 lakhs. These societies had a working capital of Rs. 164.81 crores. During the year ended June 30, 1969, sales totalled Rs. 143.24 crores. Thirteen thousand three hundred and fourteen societies were working at a profit which amounted to Rs. 3.68 crores.

The National Federation of Industrial Co-operatives, registered in March 1966, helps in buying and selling raw materials, components, parts and equipments for the use of industrial co-operatives and marketing of products. The Federation had (1969) a barter deal with the U.S.S.R. for the import of 5,000 tonnes of Sunflower Seed Oil worth Rs. 1.13 crores. In return, woollen and nylon knitwears have been exported. Musical instruments are exported to U.K.

**Khadi and Village Industries:** Since the beginning of planned development in India, village industries have been given a central place in rural programmes. The First Plan says that the development of village industries should be as much a matter of State action, as the increase of agricultural production. One cannot be separated from the other. It argues that products of large scale industries have increasingly limited the market for several classes of rural artisans. Their occupations now give them only partial employment, so that they tend to join the ranks of agricultural workers. The First Plan estimated an expenditure roughly of Rs. 7.25 crores on selected village industry schemes which would give employment for over 16 lakh persons including, full-time and part-time workers and students. The Plan envisaged a Khadi and Village Industries Board which would take on these programmes in consultation with State Governments and organizations engaged in this field.

In drawing up the Second Plan, considerable thought was given to the idea of decentralized spinning in rural homes providing adequate quantities of quality yarn for handlooms which were otherwise depending on mill yarn. Also this would considerably increase the scope for rural employment. The Khadi and Village Industries Board launched a pilot scheme on the basis of the Ambar Charkha, a three unit spinning set consisting of a carding machine, a drawing machine and a four-spindle spinning wheel costing in all about Rs. 100. With this longer programme in view the Board drew up a tentative programme for the manufacture and introduction of 25 lakh multi-spindle *charkhas* over a period of five years offering prospects of part-time and full-time employment to about 50 lakh persons. The expectation that the Ambar Charkha might play a larger part in the future development of *khadi* was not entirely fulfilled for two reasons: work on the new *charkha* was new to the spinners who had been accustomed to the traditional wheel and in the initial stages, the Ambar Charkha in quality was not upto the mark. Meanwhile the *khadi* and Village Industries Board was replaced by the Commission created by an Act of Parliament in 1956.

The Third Plan programme to introduce 3 lakh Ambar Charkhas did not materialize and only 15,534 were introduced in the first two years of the Plan. There was no significant increase in the number in subsequent years. The reason was that the Commission was engaged in designing and developing an improved model of *charkha*.

The total production of all varieties of *khadi*, including woollen and silk, increased from 538 lakh square metres in 1960-61 to 849 lakh square metres in 1965-66 but declined to 600 lakh square metres in 1968-69. In the following year, 1969-70, it went up again to 622 lakh square metres. Its value was Rs. 2,564 lakhs as against Rs. 2,338 lakhs the previous year. The *khadi* industry provides employment for about 11 lakh persons of which more than 9 lakhs are spinners.

The village industries employ 9 lakh persons including part-time workers. Production in 1969-70 was valued at Rs. 78 crores showing a slight fall of Rs. 3.50 crores of the value of production of the previous year. The sales in 1969-70 were, however, showed an edge over those of 1968-69.

The Khadi and Village Industries Commission has been spreading out its activities in the hill border areas and in places with large population belonging to the weaker sections of society. The main objective is to strengthen and stabilize their economy. The programme consists of popularization of improved equipment and implements in place of traditional ones, supply of essential consumer commodities through the development of *khadi* and village industries and organization of institutions/co-operatives of local people and artisans and training and

organizing markets for the surplus production after meeting local needs.

Pioneering work has been done in some vulnerable areas like the Rajasthan international border, Himalayan border areas of Pithorgarh, Uttar Kashi and Himachal Pradesh, and certain pockets in Kutch, Manipur and Tripura, N.E.F.A. and Nagaland.

As a result, a number of institutions consisting of local people and artisans has been set up; and they are progressively prepared to take up development work on a planned basis. Similarly, in the hill areas and tribal belts of Madhya Pradesh, Gujarat and Uttar Pradesh and the Andaman and Nicobar Islands, the results have been encouraging.

**Handlooms and Powerlooms:** The share of handlooms and powerlooms in total cloth output has increased considerably since 1948 and its contribution at present is half the entire production. Their total number in this decentralized sector was 1,409,068 in 1969 as against 1,323,618 in 1961. There is a heavy concentration of handlooms in Andhra Pradesh and Tamil Nadu.

Production in 1969, rose to 4,430 million metres from 2,942 million metres in 1961 and 1,300 million metres in 1951. (Table XXI) *Dhotis, sarees* and towelling cloth account for more than 50 per cent of handloom output. More than two-thirds of their demand for yarn is for counts above 20s.

TABLE XXI  
Composition of Cloth Outputs

(Million Metres)

| <i>Year</i> | <i>Total Cloth Output</i> | <i>Handlooms and Powerlooms</i> |
|-------------|---------------------------|---------------------------------|
| 1948        | 5,100                     | 1,151                           |
| 1951        | 5,051                     | 1,300                           |
| 1961        | 7,657                     | 2,942                           |
| 1969        | 8,613                     | 4,430                           |

The figures include output of cloth — both cotton and non-cotton. Non-cotton cloth includes man-made fabrics besides woollen, worsted and wearable fabrics.

Indian export of handloom goods during 1970-71 was over Rs. 25.62 crores. Non-traditional markets alone purchased goods of the value of more than Rs. 16 crores. Handloom products are exported to more than 100 countries.

**Rural And Urban Household Industry:** For the first time, an attempt was made in the Indian Census of 1961 to collect economic data on the basis of households in addition to the information collected about each individual citizen. In a predominantly agricultural country, most of the population is in the rural areas where much of the produce is consumed by the population. Information purely on the basis of individuals tends to go slightly out of focus, it was explained, unless such information was supplemented by data on the economic activities of the household as an entity.

Earlier, in 1958-59, the National Sample Survey, in one of the rounds, had collected some data on household industries. It had found that 135,000 households were engaged in unregistered manufacturing activity.

The data collected in the 1961 Census, based on 20 per cent sample revealed that there were 16,750,585 households in the country. Of these, 13,707,407 were rural households and the rest urban. Households engaged neither in cultivation nor in industry numbered 6,318,108 and more than half of them were rural. Rural households engaged in cultivation only were 8,554,821 and this formed an overwhelming majority of a total of 8,792,764. Similarly households engaged in industry only were 592,400 out of a total of 788,703. The rest were urban households. A total of 851,010 households were engaged both in cultivation and industry. Of this 831,010 were rural households and a bare 20,000 urban.

TABLE XXII

**Workers Engaged in Household Industry**  
(All Industries)

|       | <i>Households</i> | <i>Family Workers</i> |              | <i>Hired Workers</i> |
|-------|-------------------|-----------------------|--------------|----------------------|
|       |                   | <i>Men</i>            | <i>Women</i> |                      |
| Rural | 1,423,410         | 2,209,828             | 1,372,733    | 238,095              |
| Urban | 216,303           | 272,245               | 147,814      | 39,363               |
| Total | 1,639,713         | 2,482,073             | 1,520,547    | 277,458              |

Households, both rural and urban, were engaged in 367 industries classified into 20 major groups. These are: (1) field produce and plantation crops; (2) forestry and logging; (3) fishing; (4) livestock and hunting; (5) mining and quarrying; (6) food-stuffs; (7) beverages; (8) tobacco products; (9) textiles — cotton, jute, woollen, silk and mis-

TABLE XXXII  
Number of Persons Engaged Only in Household Industries Classified by Major Groups

|                                                                    | Households | Households engaged according to number of persons working |              |                |                 |                         | Unspecified |

cellaneous; (10) manufacture of wood and wooden products; (11) paper and paper products; (12) printing and publishing; (13) leather and leather goods; (14) rubber, petroleum and coal products; (15) chemicals and chemical products; (16) non-metallic mineral products other than petroleum and coal; (17) basic metals and their products except machinery and transport equipments; (18) machinery (all kinds other than transport) and electrical equipments; (19) transport equipments; (20) miscellaneous manufacturing industries.

#### IV. Growth of Corporate Sector

Joint Stock companies came into existence in 1845 when an act was passed to incorporate the Assam Company with an authorized capital of Rs. 50 lakhs. The Companies Act followed in 1850, but the principle of limited liability was introduced only in 1857. Banking and insurance companies received the privilege of limited liability three years later. The growth of the corporate sector was, however, very slow till the boom after the First World War. In 1900, there were only 1,340 companies with a paid-up capital of Rs. 34.70 crores (Table XXIV). Of these, 152 were cotton mills with a share capital of Rs. 11.67 crores, and 129 were tea plantations with a share capital of Rs. 3.25 crores (there were, besides, a number of sterling tea companies but data for these are not available readily in a comparable form). There were also 21 jute mill companies with a share capital of Rs. 2.68 crores.

By 1919, the total number of companies rose to 2,789 and their share capital crossed the Rs. 100 crores mark for the first time to reach the figure of Rs. 106.6 crores. The industry-wise distribution remained broadly unchanged, except for the growth of coal mines and rice and flour mills. Thereafter, growth was rapid (by contemporary standards) upto 1925; the number of companies in that year reached 5,204 and their share capital amounted to Rs. 275.5 crores, in spite of the winding up (liquidation) of 1,836 companies with a share capital of Rs. 39 crores during the period, mainly in 1922-25. In the ensuing slump that lasted through 1938, the number of companies increased consistently (except for a decline between 1937 and 1938) but their share capital remained sluggish. There were 10,657 companies in 1938, more than twice the number in 1925, but their share capital was Rs. 279 crores only.\* This sluggishness notwithstanding there was some growth in banking and insurance, cotton, jute, coal and inland navigation; thanks to protection, the number of sugar companies increased from 20 in 1919 to 172

---

\*Liquidations were a prominent feature from 1917-18 through 1930-31 during which period the paid-up capital of companies that went into liquidation exceeded in every year the paid-up capital of new companies registered.

in 1939 and their share capital expanded from Rs. 82 lakhs to Rs. 11.18 crores; interest came to be evinced in paper and rubber plantations also.

The corporate sector has not looked back since then. By 1947, there were 21,853 companies with a share capital of Rs. 479 crores which, on the eve of the First Five Year Plan in 1951, rose to 28,432 companies and Rs. 775 crores, respectively. At the end of March 1956, which marked the end of indifferent and decentralized administration of the Companies Act, the number of companies stood at 29,874 and their share capital aggregated Rs. 1,024 crores. Proliferation of bogus entities during the Second World War and unsettled conditions of the late forties led to considerable seepage of water into the corporate sector. Out of nearly 13,000 companies which 'ceased to work' (as defined by the Company Law Administration) between April 1956 and March 1962, more than one-half were struck off by Registrars of Companies for non-fulfilment of various statutory obligations. Between 1965 and 1970, 3,455 companies ceased to work. At the end of March 1970, there were 28,948 companies with a paid-up capital of Rs. 3,754.7 crores. While traditional industries like cotton, jute, sugar, etc., retain their importance, engineering and chemicals are assuming greater significance. Moreover, there is an increasing tendency towards diversification within the large companies.

Following British law and practice, companies in India are either public or private. The latter have a minimum of two shareholders and a maximum of fifty; their shares cannot be offered to the public nor are the shares freely transferable; under the Companies Act, 1956, are exempt from restrictions regarding appointment and remuneration of managerial personnel, etc., applicable to public companies but they must insert 'private' after their name. Public companies must have a minimum of seven shareholders; their shares can be offered to the public but there is no statutory obligation upon them to do so by prospectus or otherwise.

More than three-fourths of the companies registered in India are private. At the end of March 1970, the total number of non-Government companies was 28,948 with a total paid-up capital of Rs. 3,754.7 crores. Of these 6,172 were public companies whose paid-up capital was Rs. 1,658.8 crores. Private companies numbered 22,776 whose total paid-up capital was Rs. 2,095.9 crores (Table XXVI). Their relative importance in share capital is not equally impressive and would have been even less so but for the fortuitous registration of most Government companies as private companies. Curiously enough, the predominance of private companies is a post-1946 phenomenon; till 1946, the majority of companies were public, though most of these were closely owned. In fact, during the first two decades of the present

TABLE XXIV

Companies Registered and at Work in India since 1900

| As on 31st March | Number of Companies | (Paid-up Capital in Rs. Crores) |
|------------------|---------------------|---------------------------------|
|                  |                     | Paid-up Capital                 |
| 1900             | 1,340               | 34.7                            |
| 1910             | 2,216               | 61.4                            |
| 1920             | 3,668               | 123.2                           |
| 1925             | 5,204               | 275.5                           |
| 1930             | 6,919               | 286.3                           |
| 1935             | 9,842               | 304.0                           |
| 1939             | 11,114              | 290.4                           |
| 1946             | 17,343              | 424.2                           |
| 1950             | 27,558              | 723.9                           |
| 1955             | 29,625              | 969.6                           |
| 1957             | 29,357              | 1,077.6                         |
| 1960             | 26,397              | 1,618.7                         |
| 1964             | 26,457              | 2,537.5                         |
| 1970             | 28,948              | 3,754.7                         |

| 1917             | 2,306            | 85.0            | 207               | 5.8             |
| 1920             | 3,000            | 104.6           | 668               | 18.5            |
| 1939             | 6,859            | 213.2           | 4,255             | 77.2            |
| 1946             | 10,129           | 323.1           | 7,214             | 101.1           |
| 1951             | 12,568           | 566.5           | 15,964            | 208.9           |
| 1956             | 9,575            | 690.4           | 20,299            | 333.8           |
| 1960             | 7,188            | 840.5           | 19,709            | 778.2           |
| 1964             | 9,968            | 1,164.9         | 20,489            | 1,372.6         |
| 1970             | 6,172            | 1,658.8         | 22,776            | 2,095.9         |

century (data are available only from 1917 onwards) there were very few private companies. The preference for private companies that has been so much in evidence since 1946 is, perhaps, only partly attributable to the desire to avoid the greater statutory regulation of public companies; mainly, the private company appears to have become the favourite vehicle of trading and urban financial activity and nascent industrial enterprise.

The number and relative importance of Government companies have increased substantially since the beginning of planning. This category of companies was recognized for the first time in the Companies Act 1956, section 617 of which defined a Government company as one in which 51 per cent or more of the share capital is held by Government. Understood in this sense, there were 36 Government companies with a share capital of Rs. 26 crores in 1951 and 61 with a share capital of Rs. 66 crores at the end of March 1956. They accounted for about 3 per cent of the share capital of all companies in 1951 and a little more than 6 per cent in 1956. Their growth since then has been impressive. At the end of 1969-70, there were 282 government companies with a share capital of Rs. 1,790.6 crores (Table XXVII).

| 1961                        | 39                 | 33                   | 103                 | 514                  | 142          | 547                  |
| 1970                        | 81                 | 130.2                | 201                 | 1660.4               | 282          | 1790.6               |

Finally, to complete this introduction, reference may be made to foreign companies. These are companies registered outside India but with a place of business in India and should be clearly distinguished from foreign-controlled companies which are registered in India. The number of foreign companies at work increased from 579 in 1913 to 901 in 1933, declining to 819 in 1955, and further to 561 in March 1970. (Table XXVIII). The decline is attributable entirely to the weeding out of non-reporting branches of foreign companies. Most of these companies are engaged in tea plantation, insurance, trade, business, services and transport; 390 of them are of U.K. origin and 72 of U.S. origin.

TABLE XXVIII  
Foreign Companies Working in India

| Year | Number |
|------|--------|
| 1913 | 579    |
| 1923 | 720    |
| 1933 | 901    |
| 1939 | 870    |
| 1943 | 827    |
| 1947 | 834    |
| 1950 | 845    |
| 1955 | 819    |
| 1960 | 565    |
| 1963 | 583    |
| 1970 | 561    |

### V. Industrial Management

**Early History:** The management of public industrial companies in India has, in most cases, been in the hands of managing agents since the beginning of industrialization. As in Malaya, Hong Kong, the former Treaty Ports of the pre-Communist China, and Indonesia, this institution was the product of gradual evolution. The managing agency developed on the ruins of the agency house system (founded by ex-servants of the East India Company) which failed in 1833. It grew out of the enterprise of European individuals who came to Calcutta as representatives of trading companies. They found the country lacking in industrial leaders, since imports from Britain had crippled the master craftsmen and traders; money-lenders and big landowners had neither the inclination nor the experience to go into modern industry. The prospects of local processing and rudimentary manufacture for export were attractive because of the availability of raw materials and cheap labour. With the opening of the Suez Canal and laying of railways, the Indian market also appeared on the business horizon. Exploitation of the prospects required capital, contacts with suppliers of equipment and buyers of produce, and skilled labour; these the European representatives were well-qualified to supply or procure. Their mercantile experience and connections proved invaluable; the deficiency of technical expertise was made up by hiring it from Britain. The field open to each *entrepreneur* was wide; mistakes could be made without burning of fingers. *Entrepreneurs* moved from jute into coal, from tea into steamers, from these into some kind of engineering, to find a market for one in the other. The Industrial Commission of 1916-18 noted:

"A characteristic feature of organised industry and commerce in all the chief Indian centres is the presence of the large agency firms, which, except in the case of Bombay, are mainly European. In addition to a participating in the export and import trade, they finance

and manage industrial ventures all over the country and often have several branches in the large towns. The importance of these agency houses may be gauged from the fact that they control the majority of the cotton, jute and other mills, as well as of the tea gardens and the coal mines. This system originated and has still continued owing to the ability of these houses to furnish financial help to industries; it also owes its existence to some extent to the difficulty, in the case of companies under European control, of finding among the relatively small class of leading men of business available in India, directors, especially managing directors, who will remain in the country long enough to guarantee continuous supervision ... An agency firm as a rule comprises several partners, some of whom are in India, while the others attend to the firm's affairs in London or elsewhere. There is no doubt but that the system is in many ways well adapted to present conditions in India, and has a far greater list of successes to its credit than can be shown by ordinary company management under individual managing directors."

In Calcutta, the system, thus, combined ownership mainly by residents in Britain with management by partners and assistants in India. Although family influences predominated and the partnership was carried on from generation to generation, the more enterprising and ambitious of the junior assistants could look forward to becoming partners ultimately. Managing agents did the preliminary work of starting new concerns, promoted joint stock companies, employed their own funds or arranged for finance by acting as guarantors, and also managed the concerns. Besides these promotional, financing and managerial functions, they acted as agents for sales and purchases. The more important managing agencies also carried on export and import trade, insurance, banking and various kinds of agency business.

On the West Coast, the managing agents were, with some exceptions, Indian. The first written managing agency agreement was between the Bombay Spinning and Weaving Company and Cowasjee Nanabhoy Davar concluded on July 7, 1854; under the agreement he was appointed manager and broker for life, on a remuneration of 5 per cent of the sale proceeds of yarn. It can be safely presumed that the managing agency arrangements in Calcutta were imitated in Bombay by Indian merchants, who made fortunes from the opium trade with China and later, during the American Civil War, from the export of raw cotton to Lancashire; the latter alone was said to have earned Rs. 51 crores worth of gold and silver. Cowasjee Davar and Manockjee Petit in Bombay and Ranchhod Das Chotalal in Ahmedabad, and those who followed them raised most of the capital from their own resources but also secured substantial monetary and other assistance from agents of British machinery suppliers and friends. Though the mill companies were public, they had very

few shareholders. In Ahmedabad, where, unlike Bombay, most of the bigger managing agents were by tradition bankers, rather than traders, funds were raised in the form of deposits, too; the larger suppliers of capital got a share in the managing agency remuneration, contingent upon taking up a specified part of the share capital of the managed company—a rudimentary form of underwriting. In both these centres, capital was also raised from potential selling agents, etc., in consideration of future contracts. Commission to agents of machinery suppliers was often paid for in shares. The managers and technicians were generally British till the twenties. The privilege of sharing the fruits of managing agency was, however, normally restricted to members of the founding family with financiers as the only co-sharers, if any. From the thirties and forties onwards, some Indian managing agents in these centres and in Delhi, Kanpur, etc., began to give a share in the managing agency commission also to senior employees.

**Shareholdings:** The common practice with managing agents (leaving aside the fly-by-night variety found in all countries) was to promote and set up a concern and, when it was reasonably well established either to make it a public company and throw open its share capital to the public or otherwise dispose of their holdings. Care was taken at all times to retain permanent management rights; in most cases, adequate share capital was also retained in order to frustrate any move to oust them. What little evidence there is of shareholdings by managing agents in the first half of this century indicates that, whatever the position might have been in the 19th century, the well known managing agents held only a small part of the share capital of the companies under their management, and the proportion tended to decline even before 1939. But it was felt that the holdings of leading managing agents in the cotton and jute companies under their management were tending to shrink.

In the twenties, the holdings of managing agents in managed companies were small and in many cases the holdings belonged to the partners/directors of the managing agents. The Bombay Shareholders Association testified on the basis of shareholding data before the Tariff Board in 1932 that managing agent had ceased to be the principal shareholders in Bombay Cotton mills. A representative of Martin & Co. stated that his firm did not hold even 20 per cent of the companies under their managing agency because they prided themselves on the fact that they were successful agents. Managing agents were, therefore, not, in general, inclined to lock up their resources but took the earliest opportunity to free their funds for investment in other directions. The Tariff Board of 1932 observed:

“Where the managing agent represents a high standard of ability and sense of responsibility, it may make little difference to the company

to what extent the managing agent is interested in the share capital of the company. The better class of managing agent works partly for the remuneration fixed for him under his agreement but partly also out of regard for his reputation and out of a sense of pride in the tradition of management associated with his concern."

**Control and Remuneration:** Leaving aside their role as financiers (dealt with separately), it is clear that, as their direct contribution to share capital tended to decline, they sought security in permanent and comprehensive rights of management. These rights were assured through agreements in which managing agents acted in a dual capacity as managers and as shareholders. Until 1913, the law did not require an elected board of directors. When the law made elections mandatory, the outside directors depended for their continuance upon the loyalty they showed to the managing agents. Thus, although the managed companies were joint stock concerns with boards of directors, they were more akin to partnerships with outside shareholders as sleeping partners. As the holders of considerable shares (either in their own names or through partners and associated companies), it was in the managing agents' interest that the companies be managed efficiently and fair dividends be paid. But managing agents were paid in a number of other ways, too: commissions on profits, purchases, sales and insurance, remuneration to relatives and associates, etc.

**Remuneration of Managing Agents:** Managing agency by itself secured a certain value because of its rights and privileges apart from its ability to show profit in the concerns managed; the dividend earnings of agents were subordinate to their earnings in other forms. As the managers-cum-key owners were not chiefly interested in returns on investment, the general inducement to invest and public confidence in investment were adversely affected. Managing agency rights became a negotiable asset. In every boom period, the rights in many companies were transferred at fabulous prices and capitalized at inflated values; during slumps, transfers took place because the managing agents as distinct from the managed companies were in trouble and could no more raise finances on their guarantees. Even the Tatas handed over the majority control in the managing agency of their electric companies in the 1920s to an American syndicate without the prior sanction of the shareholders of the companies.

Originally, the common method of remuneration to managing agents was a commission on output. When ring spindles replaced mules in cotton mills, this system led to abuses. J. N. Tata was the first in 1886 to change over to a commission on profits. Till 1946, however, Ahmadabad cotton mills and Calcutta jute mills generally gave a com-

mission on output, in addition to an office allowance. The tea industry paid  $2\frac{1}{2}$  per cent on sales and a further  $2\frac{1}{2}$  per cent on profits. Coal and cement companies paid on the basis of profits while, in sugar, both the systems existed side by side. In 1916, Tata Iron and Steel adopted a sliding scale of remuneration, rising from 5 per cent to 9 per cent of profits according to various slabs of dividends declared. With the notable exception of Tata companies, profits were defined for this purpose as profits before interest and depreciation.

Many reputable managing agents surrendered their commission when the managed companies were in difficulties, and even gave up the interest due on debenture holdings, besides providing or securing large finances. In 1928, managing agents of 73 cotton mills in Bombay surrendered Rs. 1.91 lakhs of managing agency commission and Rs. 7.40 lakhs of interest on loans and debentures. From 1922 to 1927, Ahmadabad mill agents surrendered Rs. 13.31 lakhs of managing agency commission. The surrender in Bombay was not exactly munificent.

**Mixed Blessings:** That the managing agency system was a mixed blessing was being recognized even before 1920. The Industrial Commission was impressed by the high financial prestige of "the better-class agency firms and the readiness of the investing public to follow their lead" but was not altogether complacent about their performance.

"...they (the better class agency firms) have not escaped criticism as being unduly conservative in their methods of business and as exhibiting undue reluctance to embark on new ventures. They have been charged with lack of enterprise and an unwillingness to follow up lines of development naturally proceeding from the expansion of operations in their own specialised industries. In other words they have been inclined to develop commerce rather than industries, and thus been at times less helpful than might have been the case, in clearing the way for continuous industrial progress."

The Central Banking Enquiry Committee 1931, had the benefit of considerable evidence on the working of the system during the twenties, especially in the western region. Appraisal of this evidence induced the Committee to recommend lesser dependence on the managing agency system for industrial development:

"Although the Managing Agency system is reported to have done a great deal for the industrial development of Bombay, it is admitted that it is not by any means a perfect arrangement but has many serious drawbacks. There have been cases where the Managing Agents have, besides managing their own mills, traded and speculated and the resulting weakness in their position has reacted on the financial position of the mills themselves and led to banks withdrawing their cash credits even when the mills were intrinsically sound, merely because the Managing Agents had become weak. Further, although

it is true that in times of crisis such as Bombay has been going through, Managing Agents have incurred extensive losses as a direct result of financing the mills under their control, there have been a few cases in which these Agents have turned their loans to the mills into debentures, with the result that the concerns have passed into their hands and the shareholders have lost all their capital . . This system works well when everything goes on smoothly and when the industries are prosperous. When conditions alter and the industry or the particular concern comes up against bad times and the Managing Agents find themselves compelled to find more money to support the industry, it is found that they are not able in all cases to cope with the requirements."

"We suggest, therefore, that attempts should be made to make industrial enterprise in India less dependent on this system for future development. The establishment of direct financial relations between industrial companies and commercial banks is desirable. . "

With the passage of time more dissatisfaction was expressed with the working of the system in all its three main aspects. The well-known economist, P. S. Lokanathan said:

"There have been cases of waste . . ill conceived and fraudulent promotion. They (the managing agents) have been unwilling to pioneer and risk in new enterprises, where the profits have been neither large nor certain. However, successful the managing agency system of promotion might have been in the past, it cannot be concluded that it is so at present, or will continue to be so in the future.

"Since most Indian concerns have been under-capitalised, with share capital barely sufficient for block expenditure, the balance has to be raised from various short term or undependable or expensive sources. With debentures and preference capital unpopular, funds had to be raised by or through managing agents which had the result of further strengthening the managing agency system. Had the share and permanent capital raised at the start been sufficient to cover the needs of working expenses, there would not have been the same need for the continuance of an institution like the managing agent to finance industrial concerns.

"*While its (the system's) power for doing injury may be great, its capacity to do good is limited.* So far as the Indian section of the managing agency system is concerned, its continuance can be explained and justified only because of the concentration of ability, experience and capital in the hands of a few persons who have done great service to industrial development. If it became possible to persuade them to do for industry in an altered status what they have been doing as members of agency firms, the result would perhaps be wholly good. *There*

*are no benefits which would be lost by such a change, for those benefits are not the result of the system but of the ability and resources of the persons who run the system".*

**Companies Amendment Act:** Statutory restrictions on the power of managing agents were imposed for the first time in 1936. The duration of the appointment of a managing agent in public companies was limited to 20 years at a time, but there was no restriction on reappointments long before the expiry of the initial appointment. Managing agents could be removed if they were convicted of a non-bailable offence punishable under the Penal Code in relation to the affairs of the company. They could transfer their office only with the approval of the company in a general meeting. Powers of management were vested in the board of directors but subject to the articles of association of the company, which proved a gaping loophole. In 1938, insurance companies were debarred from having managing agents. Banking companies were similarly excluded in 1949.

**Multiple Directorships:** One of the minor reasons for the existence and continuance of the (British) managing agency houses was the difficulty of finding a sufficient number of Europeans to constitute boards of directors for industrial companies. Till 1913, and even for some years thereafter, the managing agents were the sole directors; later, the managing agents found a few friends generally solicitors and business associates, later Indian aristocrats and brokers, to serve as directors to conform with legal requirements. In 1931, out of 52 jute mills for which information was available, two had no directors (being incorporated before 1913) and the remaining 50 mills had 92 directors between them. Seventy-two coal companies had 80 directors between them, with four having none. In Bombay, around the same time, directorial talent was even more scarce: one person, for instance, was a director of 65 industrial concerns, another of 42, a third of 34, two others of 29 each, and another of 26.

The Companies Act 1956 limited the number of directorships held by an individual to 20 excluding those held in non-profit associations and those private companies which were neither holding companies nor subsidiaries of public companies. A study of the directors of 117 companies with a paid-up share capital of Rs. 50 lakhs and above registered in the western region in 1956-57 showed that these companies had 917 directorships held by 546 persons who, on an all-India basis, held 4,174 directorships in 1,905 companies, giving an average of about 8 directorships per person. Of these 546 directors, 113 held one directorship each, 294 had between 2 to 10 directorships, 95 had 11 to 20, and 44 had 21 or more; the last mentioned had 1,099 directorships between themselves.

The occupations of directors were defined rather vaguely in the relevant documents. The predominant majority, 441 out of 546, declared business as their occupation, and 33 were accountants or lawyers. Only 23 were specialists or technicians, and 49 were executives. Most of the directors were, in other words, businessmen-at-large.

Information regarding the age of directors was available for 505 out of 546. Of these, 36 were upto 30 years old, 142 were between 31 and 45, 172 were 46 to 55, and 92 between 56 and 65. The remaining 63 were above 65 and their re-appointment in public companies required a special resolution by three-fourths majority of the shareholders.

Of the 119 companies, 43 had both Indian and foreign directors. The distribution of directors by nationality in these companies was as follows:

**TABLE XXIX**  
**Distribution of Directors by Nationality in 1957**

**Companies Act 1956:** A large number of flagrant abuses in the promotion, management and financing of companies came to light in the late forties and early fifties. The abuses included cornering of shares of some leading companies listed at stock exchanges with a view to dislodging their managements, fraudulent promotions, trafficking in managing agency rights, large scale inter-company loans and investments to drain away the funds of widely owned prosperous companies into enterprises closely owned by controlling interests, widespread use of dummy shareholders and directors, oppression of minority shareholders and frauds upon creditors and tax authorities. The Company Law (Bhabha) Committee was appointed in 1951 to draft a new and consolidated Company Law. The Companies Act 1956 was based largely upon the recommendations of the Bhabha Committee. A department was set up within the Central Government to administer the Companies Act which had been administered till then by part-time officials in States. The Act required public companies and their subsidiaries to obtain prior Government approval of the appointment and remuneration of managerial personnel and their relatives and associates, inter-company investments, changes in the constitution of the managerial firms, etc.

Government was given the power to abolish the system in notified industries or businesses and Government companies were not to appoint managing agents after August 1960. Four categories of managerial personnel were recognized and defined for the first time: managing agents, secretaries and treasurers, managing director and manager\*. All the four categories are specifically subject to the superintendence, control and direction of directors. The first two can be companies, firms or individuals but the latter two have to be individuals; all have to be appointed by the company in general meeting or hold office by virtue of the company's memorandum and articles. A director having any powers of management is deemed a managing director. The maximum remuneration to managing agents is fixed at 10 per cent of profits after depreciation. The maximum for secretaries and treasurers is  $7\frac{1}{2}$  per cent and for managing directors and managers 5 per cent. Managerial personnel (and their partners or members if any) are not permitted to hold any other office of profit under the company. The period of appointment is 5 years at a time of managing directors, ordinarily 5 years but upto a maximum of 10 years for managing agents. No company can have more than one category of managerial personnel.

The Act has tightened up the conditions of issue of prospectus, required greater disclosure of accounts and interests of managerial personnel (which term does not include other officers of the company), abolished the issue or continuance of shares with disproportionate voting power, and restrained fraudulent persons from managing companies. No person can be a director of more than twenty public companies; managing agents (including managing agents under the same control) can manage not more than 10 companies but there is no restriction on the employment of the previous managing agents as secretaries and treasurers who can manage any number of companies; managing directors and managers can manage not more than two companies. Important decisions require shareholders' approval through special resolutions, which have to be passed by three-fourths majority.

Amendments between 1960 and 1965 have tightened up or introduced provisions relating to inter-company investments, private companies in which 25 per cent or more of share capital is held by public companies, audit and cost audit, powers of investigation by Government, appointment of sole selling agents, and preventing undesirable persons from exercising their voting power as shareholders. A Public Trustee has been appointed to take over the voting power of large trusts and a special tribunal has been vested with powers to remove managerial personnel and officers for misconduct. Government has the power to nominate

\*The distinction between a statutory manager and other persons holding that designation or rank is that the former has powers of management as defined under the Companies Act and is or can be remunerated on the basis of a commission on profits.

two directors to protect minority interests and/or in the public interest. The amendments proposed in 1965 will remove many of the procedural rigidities which had been encountered in the administration of the Act.

Between 1956 and 1962, the Central Government, in consultation with the Company Law Advisory Commission, evolved certain principles and criteria for granting approval to the appointment of managing agents, managing directors, etc. These are broadly as follows:

1. The term of office of managing agents is ordinarily ten years for initial appointment and 5 years for re-appointment; for managing directors the term is five years or less.
2. The remuneration to the managing agents is generally fixed on the following scale:
  - 10 per cent on the first Rs. 10 lakhs of profit
  - 9 per cent on the next Rs. 10 lakhs
  - 8 per cent on the next Rs. 10 lakhs
  - 7 per cent on the next Rs. 10 lakhs
  - 6 per cent on the next Rs. 10 lakhs
  - 5½ per cent on the next Rs. 25 lakhs
  - 5 per cent on the next Rs. 25 lakhs
  - 4 per cent on any sum over Rs. 1 crore.

Where, in exceptional cases, a fixed rate of commission is laid down, a ceiling on the amount of remuneration in any single year is prescribed. The minimum remuneration in the event of absence or inadequacy of profits ranges from Rs. 7,500 per year for a company with total long-term capital of Rs. 5 lakhs or less to Rs. 50,000 for a company with total long-term capital of over Rs. 150 lakhs. In private companies, the maximum remuneration permitted is 20 per cent of profits. Remuneration in other forms paid to directors or members or partners (as the case may be) of managing agents is to be charged against their commission. The maximum guarantee commission payable to managing agents is 1/10 of their total remuneration provided that, inclusive of it, the total commission paid to managing agents does not exceed 10 per cent of profits.

Exceptions to the above are made in favour of heavy and high priority industries which have long gestation periods.

3. Approval of remuneration is related to the financial resources of the company, dividend record, turnover, size of unit, nature of business, extent to responsibility delegated, the number of managing directors proposed (total remuneration, if this is more than one, is subject to a maximum of 10 per cent of profits), and the nationality and previous experience of the personnel. The minimum remuneration limit of Rs. 50,000 is relaxed more frequently than for managing agents. The maximum remuneration is generally Rs. 120,000 per year but higher amounts are permitted to foreigners and others in exceptional cases.

A study carried out by the Company Law Administration in 1962-63 revealed that the nature of services rendered by managing agents to companies managed by them varied very widely. While some managing agents provided guidance on policy matters and the benefit of common expert services to their managed companies by employing wholtime paid directors and senior technical personnel, others gave only the benefit of their personnel advice and guidance to the managed companies. In some cases the cost of the common expert services was borne by the managing agents, while in others the entire cost of the services was distributed equitably over companies benefiting from them. The study also disclosed that it was difficult to find any reasonable common measure of services rendered by all or most of the managing agency houses in India. The Department also felt that it was not easy to distinguish between purely managerial and executive services. In the light of the results of the study, the Department came to the conclusion that, by and large, an illustrative list of services which could ordinarily be regarded as falling within the scope of the direct responsibility of the managing agents would include:

- (a) overall supervision and control of the various operations subject to the general policy laid down by the Board of the managed company.
- (b) co-ordination and integration of the departmental or divisional activities.
- (c) dissemination of useful information.
- (d) advice and guidance regarding sale of the company's products,
- (e) undertaking of research,
- (f) purchase of raw materials, import of capital goods and replacement of personnel, and
- (g) planning and development, etc.

Apart from the services enumerated above, the managing agents are also expected to render promotional and financial services and to maintain a central organization for providing legal, accounting, taxation, technical, secretarial and other such administrative and routine services. The expenditure incurred by them for rendering non-managerial services can be reimbursed to the extent permissible under the law.

In January 1965, the Government, as required by Section 324 of the Companies Act 1956, appointed a committee of five senior officials to enquire into and report on the continuance of the managing agency system in five established industries, cement, cotton, paper, sugar and jute, and in any other industry or business as may be deemed fit.

In the meantime, Government had been exercising its administrative discretion to weed out managing agents in several cases. Between April 1, 1964 and February 28, 1965, Government renewed the appointment of managing agents in 33 companies and refused permission to 40.

**Different Forms of Management:** Statistical data on the significance of the managing agency system have been available since the mid-fifties. In 1954-55, there were 3,944 managing agents, of which 2,522 were unincorporated firms, 1,238 private companies and 184 public companies. These managing agents managed in all 5,055 companies, out of the total of 28,568 companies (excluding banking, insurance and Government companies) in that year. The 5,055 managed companies accounted for 54 per cent of the total share capital of 28,568 companies. Out of 3,944 managing agents, 3,526 managed only one company each and 250 managed two companies each. About 95 per cent of the managing agents thus managed two companies or less. Only 17 managing agents managed 10 or more companies each.

In 1962-63, the number of managing agents came down to 1,044, of which 548 were unincorporated firms, 402 private companies and 94 public companies. The 1,044 managing agents managed 1,440 companies, out of a total of 24,598 companies (excluding banking, insurance and Government companies) in that year. Out of 1,044 managing agents in 1962-63, 899 managed one company each and 67 two each. About 93 per cent of the managing agents thus managed two companies or less. Only 7 managing agents managed 10 companies each, which excludes others which they managed as secretaries and treasurers.

In 1954-55, the system was of predominant importance in plantations, coal, grains and pulses, vegetable oil, sugar, textiles, iron and steel, transport equipment, cement, clay and glass, paper, power and transport. Its importance was relatively nominal in services and in two industries, tobacco and rubber, which were mainly under the control of international combines (Imperial Tobacco and Dunlop Rubber). By 1960-61, when all old managing agency agreements expired, the importance of the system in the aggregate was greatly reduced by the formation of Government companies, transmutation of erstwhile managing agents into secretaries and treasurers, greater frequency of subsidiaries, and flotation of new companies with other forms of management. In that year, managing agents continued nevertheless to be of predominant importance in plantations (in tea, subsidiaries and director managed companies became more significant), vegetable oil and dairy products, sugar, textiles, cement, power and basic iron and steel.

**Secretaries and Treasurers:** The institution of secretaries and treasurers was recognized for the first time in the Companies Act 1956. There was no reference to it in the report of the Bhabha Committee. The intention of the then Finance Minister, Shri C. D. Deshmukh, in encouraging the adoption of this system was, among other things, to smoothen the transition from managing agency to other forms of management and to enable those managing agents who managed more than 10

TABLE XXX  
Companies Managed by Managing Agents—Industry-wise

1960-61: *Company News and Notes*, December 16, 1964.

companies to retain the management of the excess number. Under the Act, secretaries and treasurers had practically the same powers as managing agents, except that they had no right to nominate directors and their maximum remuneration was 7½ per cent of profits.

Before the expiry of all old managing agency agreements on the notified date, namely, August 15, 1960, there were only 9 companies with a paid up capital of Rs. 1.6 crores which were managed by secretaries and treasurers. As on August 16, 1960, 179 companies were managed by 45 secretaries and treasurers.

**Over-all Pattern:** Since 1956, the number of new companies proposing the appointment of managing agents declined steeply. Between April 1956 and March 1963, 9,150 new companies were formed. Of these, 134 companies had managing agents, 15 had managers, 18 secretaries and treasurers, and 2,681 managing directors; the remaining 6,302 were managed by boards of directors without any statutory managerial personnel.

In 1964, nevertheless, the relative importance of the managing agency system in terms of the share capital of public non-Government companies remained practically unassailed. More than one-half of the share capital of non-Government public companies was in companies managed by managing agents and their close variant, secretaries and treasurers. If banks, insurance and other service companies, and subsidiaries of international combines, which by tradition do not or under the statute cannot have managing agents are excluded, the proportion would rise from one-half to about three-fourths or more. In spite of the decline in its popularity, *the managing agency system is far from dead or dying*. Managing directors and their variant, managers, are comparatively insignificant as a form of management.

It should be emphasized, at the same time, that remuneration to managing agents has been tending to decline. It was 13.4 per cent of profits before tax (which is slightly different from the definition of profit and calculating the remuneration of managerial personnel in the Companies Act) in the aggregate Reserve Bank sample of public companies (including those not managed by managing agents) in 1950 and 4.9 per cent in 1962-63 (Table XXXI). The decline has taken place mostly in large-sized companies, *i.e.*, those having a paid-up capital of Rs. 50 lakhs and above (Table XXXII). Separate data for companies actually managed by managing agents are available only for 1955-59. The number of companies so managed declined during this period and remuneration as percentage of profits came down from 14.3 per cent in 1955 to 9.1 per cent in 1959. (Table XXXIII). Shrinkage in remuneration was most obvious in traditionally managing agency managed industries like tea, coal, sugar and textiles.

Comparable data on remuneration to managing directors are not available. A sample study of 125 companies having this form of management in 1962 found (rather inconclusively since the sample was heterogeneous and included Government and managing agency companies) that this system appeared somewhat expensive at lower levels of profits but quite economical at higher levels of profits (Table XXXIV).

TABLE XXXI

## Remuneration to Managing Agents 1950-63

|          | <i>No. of<br/>Companies</i> | <i>Profits*<br/>(Rs. Cr.)</i> | <i>Remuneration<br/>to Mg. Agents<br/>(Rs. Cr.)</i> | <i>(3) as %<br/>of (2)</i> |

**Appraisal of Managing Agency System:** The significance of the managing agency system lies in its predominance in the management of large public, mainly industrial companies, but it is not the only form of group management. In a study of the ownership and control of more than 1,000 companies in which twenty selected business groups had an interest of one kind or other in 1958, it was found that only 372 were managed by managing agents; the remaining had other forms of management. The findings of the study were:

- (a) Almost every well-known business group had a large number of managing agencies, most of which managed only one company each, while a few managed a very large number.
- (b) Barring a few, which had other business besides managing agency, nearly all managing agencies had very little resources. They provided only a small fraction (less than 3 per cent) of the total share capital of the companies under their management; most of the controlling investments in managed companies were held by other companies in the group.
- (c) A large part of the share capital of managing agency companies was owned by other companies. In fact, many leading managing agency companies were subsidiaries or joint subsidiaries of other companies. This indicated that they were merely the management departments of the groups concerned, and did not constitute the fountain-heads of control.
- (d) A fairly large number of managing agencies were under the joint control of more than one controlling interest.

The principal advantages claimed for this system, as distinguished from other methods of managing companies under the same control, are that •

- (i) it provides firm and stable control over management; (ii) it secures the economies of large-scale operations, *e.g.*, in marketing, finance and management to companies under the same management; and (iii) it provides a flexible system of remuneration to top management.

Managing agency agreements did not appear to be generally necessary for the purpose of exercising voting control over the management of

public companies. The total controlling blocks in the public industrial companies of most groups were sufficiently large to enable the controlling interests to control the management of these companies even without the additional power of control conferred by managing agency agreements.

The firm and stable control which the managing agency system is supposed to provide means the perpetuation of family control. The system confers a birthright upon the managing agency family not merely to control the management of companies in the group but also to participate actively in and to direct their routine management. The technical and managerial deficiencies of hereditary management have been made up to some extent, in recent years, by the employment of professional technicians and managers, but the appointment of family members at levels superior to these professionals tends to weaken efficiency and leads to an overlapping of hierarchy in the top management of the managed companies.

There is often confusion within many managing agencies, too, for all the partners (if the managing agency is a joint venture) as well as the active family members have the right to intervene directly in the day-to-day affairs of the managed companies.

The question of the accrual of economies of management to companies under the same management can arise only in the case of those managing agents which manage a large number of companies. Most managing agents manage only one or two companies each. In their case, the question of economies of management does not arise at all.

The few managing agents who manage a large number of companies cannot claim special expertise in each of the various industries in which they have a managerial interest. They are not under an obligation to provide the best managerial and technical expertise at their own cost. The cost of the expertise, when it is obtained, is almost invariably charged to the managed companies, not to the managing agents.

The rate of commission on the profits of managed companies which is charged by the managing agents is independent of the number of companies managed by a single managing agent. If managing agent A, for instance, manages 10 companies, the rate of commission paid by each of these 10 companies is not any lower because the same managing agent manages 9 other companies too. The economies of management, if any, therefore, accrue to the managing agent, not the managed companies.

As members of a group, the managed companies do share and receive many common services and facilities. These depend upon membership of the group, not upon a particular system of management. So long as companies A and B, for example, belong to the same group, both are entitled to share the group facilities, whether one or both are managed by managing agents or have some other form of management.

The managing agency system is superfluous in most business groups from the point of view of finance and marketing as well. The financing and marketing role of managing agents is now generally undertaken by their associates within the group and these associates are remunerated separately for performing that role.

The managing agents are remunerated on the basis of a commission on the profits of the managed companies as laid down under the Companies Act and various official decisions. This system of remuneration does appear flexible as compared with the payment of fixed amounts to top management, but the flexibility is superficial. Most, if not all, of the expertise obtained for the managed companies is generally debited to them, not to the managing agents. To the extent a commission does save on large fixed salaries to top management, it tends to be offset by the fact that the management secured in return for the commission is only part-time. The managing agents as a company and their members as individuals are free to have other occupations, and any number of other management jobs in various capacities, even if these involve a conflict of interest. Besides, in a protected market, the flexibility of the remuneration tends to be one way and that is upwards.

The conclusion, therefore, is that the managing agency system is an expensive, irrational and part-time system of management. Its abolition is necessary in order to rationalize the management of public industrial companies. The removal of this system will not make any difference to the control and management of companies by groups. It will alter only the form, status, and system of remuneration of top management. For some time to come, that is, till there is a fundamental change in the structure of attitudes of management, even the association of the controlling families with the routine management of companies will continue. The reform will, over a period of time, separate the power to appoint and control management, which is bound to remain with the controlling families or their representatives, from the actual exercise of managerial functions. It will give an impetus to the building up of professional technical-cum-managerial cadres, the top members of which would be judged by their performance, not by their blood relationship and financial participation.

Apart from the reasons referred to above, it has also been pointed out that, since 1957, foreign technical and financial collaborators have been providing a large part of the expertise and resources which managing agents were said to be providing before; that the public and semi-public financial institutions set up since 1948 make available resources of a magnitude which managing agents could never raise and that their underwriting activities have largely replaced the functions of managing agents. Attention is also drawn to the fact that, unlike the European firms which established themselves in the 19th century (the foreign element in which has been withering away since 1946), new foreign private

investment comes largely from international combines which do not rely on the managing agency system.

The Monopolies Inquiry Commission, in its report (1965) while agreeing that the managing agency system played an important part in quickening industrial development, it produced a high degree of concentration of power in the hands of a few family groups. The Commission explained why it was not making any recommendation regarding abolition or control of the system. The most important of its reasons, was, the Commission's doubt whether even the total abolition of the managing agency system at that stage would have any marked effect in curbing the growth of concentration of economic power. The Commission was inclined to believe that even if the system went, its place would quickly be taken by some other system of group management or some other method which it would not be practicable to prevent. Secondly, the question of what action should be taken in addition to what had been provided in the Companies Act had to be decided not only on a consideration of its effect on concentration of economic power but as a full and careful assessment of the effects of any proposed action as the process of the country's industrial development. Another reason which was in the Commission's mind was that a Government-appointed committee was already examining the future of managing agencies in certain selected industries.

This Committee of senior officials (reference to which has been made earlier in this chapter) made its report in March 1966. After considering the position of the five industries it had selected for the purpose of its inquiry, recommended discontinuance of the managing agency system in three of them namely, cotton-textiles, cement and sugar industries. It felt that other things being equal, the system should be discouraged on wider social and economic grounds. However, the Committee felt, a reasonable time should be allowed to the Companies for a changeover to other systems. The Government however, decided to abolish the system in all the five industries: cotton-textiles, cement, jute textiles, sugar and paper and pulp at the end of a three year period.

The decision was announced in Parliament on September 5, 1966 by the Minister of Law. He also announced that the question of the continuance of the managing agency system in other established industries would be reviewed within the next three years in order to bring about their progressive reduction.

According to official figures as on April 1, 1966, there were 869 companies with managing agents. Of these, 302 companies were accounted for by cotton-textiles, cement, sugar, jute textiles and paper and pulp industries in which the system was to be abolished. This left a balance of 567 managed companies in industries and business whose cases were to be reviewed.

**Decision on Total Abolition:** In December 1967, Parliament was in-

formed of Government's decision to abolish the Managing Agency System altogether. Six months later, on May 10, 1968, the Minister for Industrial Development and Company Affairs, introduced in the Lok Sabha a Bill to amend the Companies Act.

The number of managed companies had been progressively going down over the years. In 1954-55, there were 5,055 such companies and by March 1964, the number had gone down to 1,272 and further to 674 by the end of March 1968. Of the 674 companies, 474 ceased to be managed companies by efflux of time that is by April 3, 1970. This left a balance of 200 managed companies.

The Amending Bill was passed by Parliament in May 1969 on Presidential assent, became an Act on May 28, 1969. Accordingly, the systems of management of companies by Managing Agents and Secretaries and Treasurers stood abolished with effect from April 2, 1970. Such companies had now to switch over to alternate forms of management: namely, (i) Board of Directors, or (ii) Managing Directors/Whole-time Directors/Managers. Appointments of Managing Directors/Whole-time Directors/Managers are made by the Board of Directors and their remunerations approved at the general meeting of the Company. Such appointments and remunerations to be paid require the approval of the Government of India. Between April 1, 1969 and March 31, 1970, the Company Law Board received 613 applications relating to Managing Directors, Whole-time Directors and Managers.

As at the end of March 1970, there were 179 managed companies and 139 managing agents (Table XXXV & XXXVI).

As on the same date, there were 23 Secretaries and Treasurers managing 52 public limited companies (Table XXXVII).

## VI. Ownership and Control of Companies

The earliest data on the pattern and concentration of ownership and control of companies relate to 1927 or thereabouts. They give some idea of the concentration of ownership in cotton, jute and coal compa-

nies. Ownership was highly concentrated in cotton and coal, slightly less in jute. More recent data for the fifties indicate that about one-half of the share capital of companies is owned by individuals and the major part of the remaining one-half by companies, with the Life Insurance Corporation playing an important role as supplier of preference capital. A study of the situation in 1951 and 1958 establishes that institutional, *i.e.*, other than individual, ownership of share capital is becoming increasingly significant, mainly, because most of the subscription from the controlling interests comes from companies and trusts, not individuals. This conclusion is confirmed by the Reserve Bank which found that new companies raised the major part of their capital from other companies, 75 per cent against 36 per cent only in the case of the older companies in the sample. The Gini Co-efficient of concentration in the Reserve Bank sample was 0.82 for all sample companies together, higher at 0.89 per cent in new companies. The boom on the stock exchange which lasted from 1959 to 1961 was reported to have attracted a large number of small investors into the capital market for the first time. In view, however, of the large proportions of share capital of new companies taken up by foreign collaborators, underwriters and financial institutions, etc., a decline in the concentration of ownership since 1959 is unlikely.

The proportion of total share capital of private companies owned by Indian and foreign companies increased from about 54 per cent in 1951 to 60 per cent in 1958. The proportion owned by individuals fell from 35 to 25 per cent and that owned by trusts from more than seven to less than 6 per cent. In public companies, individuals owned more than half of the total share capital in both years but the proportions clearly tended to decline.

Indian companies owned more share capital than Indian individuals in both years (under study) in 10 out of 28 industrial heads: coal (other than mining), cotton, woollen, plantations, printing and publishing, construction, investment and finance, managing agency and trade. Also, Indian companies came to hold a larger proportion of share capital than Indian individual heads: rayon, jute, engineering, food and vegetable oil, real estate, etc. The industries in which the major part of share capital was held by Indian individuals were: power, basic iron and steel, non-ferrous engineering, sugar, glass, plastic and pottery, cement, transport, banking and insurance. In chemicals and paper too, individuals held slightly more share capital than companies.

Government's investment in both years was concentrated mainly in engineering, chemicals and cement. Life Insurance Corporation's (L.I.C.) investments were distributed fairly widely but tended to concentrate in basic iron and steel, cement, engineering, power, chemicals, paper, transport managing agency and other industry. Trusts were significant holders in cotton, iron and steel engineering, paper, hotels,

investment and finance, managing agency and other industry. During the period foreign investments increased only in iron and steel, engineering, chemicals, cement, other industry and trade.

Investment companies were the largest single occupational group of corporate shareholders in almost every industry, with the exception of coal, power, iron and steel and transport, to which chemicals and cement were added in 1958, much of the investment by industrial companies in other companies was within the same industry or represented a vertical spread, like steel investing in coal. There were however quite a few instances of significant investments in unrelated industries as for example: (1) coal received significant amounts from cotton in 1951, sugar, paper and 'other industry' in 1958; (2) paper was a receiver from cotton in 1951, coal, jute, engineering, sugar, real estate, cement and 'other industry' in 1958; (3) engineering was a receiver from cotton, sugar, jute, chemicals and paper in 1951, cotton, sugar, food and vegetable oils, chemicals, paper, cement and 'other industry' in 1958. Most of the investing 'other industry' companies were those that had diversified from cotton or jute or sugar. In addition, banking, insurance, investment and managing agency companies also had substantial holdings by industrial companies.

**Occupational Diversification:** Each one of the twenty companies is occupationally diversified. The larger the complex, the more diversified it generally tends to be. Consequently, concentration in India is far from synonymous with monopoly in a particular industry. To give some examples:

Tata is interested mainly in steel engineering and power, and has a variety of other interests including cement, cotton, chemicals, soap and vegetable oil, etc., bonds insurance, investments and trade. Birla has a stake in almost every industry except steel, power and transport. The interests of Martin Burn are rather limited by contrast. They carry only steel, engineering, power and transport. The interests of Dalmia-Sahu-Jain are in jute, cement, paper, chemicals, newspapers, banking, insurance, investments and trade.

**Proliferation of Companies:** Tata, Martin Burn and Shri Ram alone among the larger groups prefer to concentrate most of their assets in a few large companies. In Birla, Dalmia-Sahu-Jain, Bird-Heilgar, Bangur and J.K. on the other hand, there is a tendency to disburse industrial, trading and financial activity over a large number of companies. This tendency is attributable only in fact to the nature and variety of their occupational interests, for all of them (except Bird-Heilgar) have diversified many of their leading companies. Among the relatively smaller groups, some degree of justification of the number of companies is necessitated by the variety of occupations and joint ventures with other interests. Even among them, Ramakrishna has diversified two com-

panies. These differences, notwithstanding, almost every group (with fair exceptions) appears to maintain a number of Government companies *i.e.* companies, the accounts of which, show hardly any activity. This phenomenon is especially prominent in Bata, Dalmia-Sahu-Jain, Bird-Heilgar and Khatau. Besides, Birla and Dalmia-Sahu-Jain, particularly the latter, had a high level of corporate mortality, too during the period under reference.

**Joint Ventures:** Joint ventures, that is companies having more than one controlling interest, are a frequent and important phenomenon in the corporate section. These include foreign partners also. The overall significance of joint ventures is indicated by the fact that in 1958, out of 1,078 companies having a share capital of Rs. 361 crores, and gross capital stock of Rs. 1,121 crores, 274 companies with a share capital of Rs. 119 crores and gross capital stock of Rs. 127 crores, had foreign partners in either companies registered abroad or companies under foreign control registered in India. Of the 274 joint venture companies, 82 with a share capital of Rs. 41 crores and a gross capital stock of Rs. 106 crores were under the sole control of the decision making authority of the twenty complexes: That is to say, the groups concerned had the majority interest in them. Foreign minority partners played a significant role in these ventures, accounting for 25 companies which had a share capital of Rs. 20 crores and gross capital stock of Rs. 62 crores. The role is all the more significant because foreign participation in share capital became a necessity only after 1958 due to the foreign exchange crisis. Such joint ventures with foreign partners were prominent in Tatas, Kasturbhai and Thapar. On the whole, however, only a few groups had majority ventures, besides, Tata, Kasturbhai and Thapar, Indra Singh, Kirloskar, Seshasayee and Shapoorji. In Khatau, Martin Burn and Ramakrishna on the other hand, there were no majority joint ventures at all. Most of the joint ventures took the favour of minority participation by the groups concerned. In several cases, such participation is indirect or of the second order *i.e.* a minority venture in turn holds a controlling interest in another venture. For example, Tata has a minority interest in ACC which has a minority interest in Asbestos Cement.

**Financial Structure:** The twenty companies included 592 public companies in 1951 and 622 in 1958. These companies financed the greater part of their substantial expansion from external sources. About 32 per cent of the gross total funds came from loans and 24 per cent from short terms liabilities making a total of 56 per cent from borrowings. Share capital (including capitalized reserves) provided nearly 16 per cent. About 9 per cent came from free resources and 19 per cent from depreciation. On the used side, gross fixed assets absorbed more than 64 per

cent of the gross total funds raised, and nearly 21 per cent went into inventory, making a total of 85 per cent for the formation of gross physical assets. Only 3 per cent was absorbed in investments of which more than 11 per cent went into receivables and cash. The period thus witnessed a substantial increase in the ratio of debtors equity, and of fixed to working capital. These changes brought about a degree of deviation from orthodox financial standards. In 1951, the share capital of public companies was more than adequate to convert fixed assets, while reserves almost covered inventory requirements. In 1958, net worth was barely adequate even for net fixed assets.

Taking private and public companies together, the ratio of preference to total share capital declined from 20 to 18 per cent during the period. The data on shareholding cover 988 companies in 1951 and 1,079 in 1958. The various types of owners are:

1. Individuals in India
2. Indian Companies
3. Life Insurance Corporation of India
4. Government
5. Trusts
6. Foreign Individuals
7. Foreign Companies

Out of 988 (1951) and 1,079 (1958) companies, only 258 and 214 respectively were owned wholly by individuals and trusts. In both years, individuals in India owned about one half of the total share capital, Indian companies, 37 per cent, foreign investors about 4 per cent and trusts 3 per cent. There was thus no striking change in the broad pattern of ownership between these years. More specifically, the proportion of total share capital owned by individuals, both Indian and foreign and by Government, declined slightly during the period. The proportion owned by Indian companies remained practically constant at 37 per cent. The Life Insurance Corporation set up in 1956, came to acquire about 5 per cent of total share capital by 1958. If the holdings of Indian and foreign companies and the Life Insurance Corporation are lumped together, the proportion held by them rose by 6 per cent to 45 per cent. The ownership of share capital is thus evolving gradually in favour of corporate and away from individual owners.

Government's total investment in the sample companies amounted to Rs. 13.28 crores in 1951 and Rs. 15.58 crores in 1958. The Life Insurance Corporation had a total investment of Rs. 17.57 crores in 1958. The investments of Government and the Life Insurance Corporation are in the larger complexes. This pattern of distribution is largely the result of historical circumstances (integration of timely state) and market conditions at various times.

While some public industrial companies are quite widely owned, the general picture is one in which the controlling interests still hold a

fairly large proportion, in many cases the bulk, of share capital. Between 1951 and 1958, the proportion of share capital held by controlling interests in the public companies belonging to 20 business groups declined from 48 to 43 per cent under equity and 23 to 17 per cent under preference, which normally does not carry voting power. These over all proportions covered up fairly wide inter-group differences for, in some groups, the controlling interests tended to hold the predominant majority of share capital or, at least, equity capital. Inter-corporate investment is the main instrument, and an increasingly important one, for the control of companies. In both 1951 and 1958, more than two-thirds of the controlling block was held by companies, and their holdings acquired greater importance during the period.

TABLE XXXVIII  
Ownership of Cotton Mill Companies, 1927

| Investment and Finance Companies                 | 5.86                  | 2.75                      | 5.28                 |
| Non-financial (Trading and Industrial) Companies | 18.08                 | 2.94                      | 15.32                |
| Government                                       | 7.05                  | 11.60                     | 7.88                 |
| Foreigners                                       | 11.96                 | 2.24                      | 10.19                |
| Individuals                                      | 51.94                 | 64.72                     | 54.28                |
| Total:                                           | 100.00                | 100.00                    | 100.00               |

\*On the basis of information supplied from the share registers, holdings of banks were 4.44 per cent of equity capital, 11.48 per cent of preference capital and 5.74 per cent total paid-up capital. As most of these were nominee holdings, the figures have been replaced by estimates made on the basis of total investments of banks in shares.

**TABLE XLII**  
**Pattern of Ownership of 70 Companies by Type of Owner, 1959**

| <i>Type of Owner</i>                      | <i>No. of Accounts</i> | <i>Value (Rs. lakhs)</i> |
|-------------------------------------------|------------------------|--------------------------|
| 1. Individuals (including joint holdings) | 4,86,519<br>(98.87)    | 110.55<br>(52.95)        |
| 2. Institutions                           |                        |                          |
| (a) Joint Stock Companies                 | 4,461<br>(0.91)        | 8,416<br>(39.62)         |
| (b) Trusts and Charitable Institutions    | 814<br>(0.17)          | 268<br>(1.26)            |
| (c) Other Institutions (including L.I.C.) | 213<br>(0.04)          | 1,235<br>(5.81)          |
| 3. Others                                 | 59<br>(0.01)           | 268<br>(1.26)            |
| All Categories                            | 4,92,066<br>(100.00)   | 212.42<br>(100.0)        |

*Note:* (1) Figures in brackets indicate percentages to total.

(2) If each joint holder is treated as separate shareholder, the total number of individual shareholders would work out to 6,86,184.

| 20. Kirloskar       | 27.9 | —     | 27.9   | 1.7   |
| Total:              | 48.0 | 22.7  | 43.1   | 17.3  |

\*The decline occurred owing to the acquisition of the Brady group in 1958.

\*\*The increase is mainly due to the conversion of the principal company from private to public.

About 83 per cent of the additional share capital subscribed by controlling interests between 1951 and 1958 came from companies, 12 per cent from trusts and 5 per cent only from individuals. The total share capital of companies in the 20 groups increased during the period by Rs. 93 crores, of which individuals in India and abroad provided a little more than Rs. 38 crores; the individuals who constituted the ultimate controlling interests of these groups accounted for only Rs. 1 crore out of Rs. 38 crores.

Their much-talked-about role as providers of finance notwithstanding, managing agents *per se* (as distinct from the controlling interests as a whole) owned only 3.0 and 2.5 per cent of the total share capital of industrial companies in 1951 and 1958, respectively. Even as a proportion of the total controlling blocks, their holding was 8.4 per cent in 1951 and 7.4 per cent in 1958.

**Subsidiary Companies:** As of end-March 1963, there were 828 subsidiary companies in India with a total share capital of Rs. 218 crores, roughly 16 per cent of the share capital of all non-Government companies. Of

|                                                                     | (210)  | (124.75)        |
| Total:                                                              | 828    | 217.50          |
|                                                                     | (220)  | (129.62)        |

Figures in parentheses are for foreign subsidiaries. Most of the subsidiaries, particularly foreign subsidiaries, did without managing agents and generally relied upon managing directors or boards of directors.

**Concentration of Economic Power:** This has been measured in the private corporate sector on the basis of the share of the leading business groups in aggregate share capital and physical assets.

The four largest groups, Tata, Birla, Martin Burn and Dalmia-Sahu-Jain, had nearly 18 per cent of the share capital of non-Government public companies in 1951. This proportion rose to more than 22 per cent in 1958. Including their minority and fifty-fifty interests in other companies, the ratio went up from 22 to 27 per cent.

The share of these four largest groups in the gross capital stock, *i.e.*, net fixed assets plus accumulated depreciation plus inventory, of non-Government public companies expanded during the same period from 17 to 22 per cent. Including their minority and fifty-fifty interests, the ratio went up from 20 to 26 per cent.

In 1958, the public companies in which Tatas and Birlas had an interest of one kind or other had nearly one-fifth of the gross capital stock of all non-Government public companies.

Figures in parentheses are percentages of all non-Government public companies.

The Mahalonobis Committee on Distribution of Income and Levels of Living in its report in 1964 also came to the conclusion that concentration of economic power in the private sector was more than what could be justified as necessary on functional grounds and it existed both in generalized and in specific forms. It suggested that a free time agency should make a detailed enquiry into the operations of individual companies.

Accordingly, in the same year, 1964, Government constituted the Monopolies Inquiry Commission headed by K. C. Das Gupta, a judge of the Supreme Court of India. Its terms of reference were:

- (a) to inquire into the extent and effect of concentration of economic power in private hands and the prevalence of monopolistic and

restriction practices in important sectors of economic activity, other than agriculture, with special reference to (i) the factors responsible for such concentration and monopolistic and restriction practices; (ii) their social and economic consequences, and the extent to which they might work to the common detriment, and

- (b) to suggest such legislative and other measures that might be considered necessary in the light of such inquiry, including, in particular, any new legislation to protect essential public interests and the procedure and agency for the enforcement of such legislation.

Incidentally, this was the first official authoritative body to find a solution to a grave economic malady. The Commission was appointed under the chairmanship of Inquiry Act 1952, and it submitted its report to Government at the end of October 1965.

**Power Manifestation:** The Commission concentrated its attention on the different manifestations of economic power in the private corporate sector. One such manifestation, according to the Commission, is the achievement by one or more units in an industry of such a dominant position that they are able to control the market by regulating prices or output or eliminating competition. Another is the adoption of some producers and distributors, even though they do not enjoy such a dominant position, of practices which restrain competition and thereby deprive the community of beneficent effects of the rivalry between producers and producers and distributors and distributors, to give the best service. Such practices inevitably impede the best utilization of the means of production. Also a few industrialists, obtain control of large areas of economic activity by various means. Clearly, the Commission held that concentration of economic power is the Central problem. Monopolistic and restrictive trade practices are the functions of such concentration.

The Commission, in its report, listed seven causes of concentration of economic power in private hands:

The economics of scale brought about largely by technological advances and the capital formation; the supply of managerial skill in different forms and diverse ways — the managing agency system; the investment of funds by one corporation in acquiring the assets or stocks or shares of another independent corporation. Where such investment is made in a corporation in the same line of business, it tends to promote what the Commission has termed "industry-wise" concentration. Where the investment is made in a corporation in a non-competing line of business, it helps in the growth of "country-wise" concentration. The effect on competition is particularly adverse where the investment is in

*a competing line of business. The effect is bound to be considerable at a*  
*where the investee company, though non-competing, is engaged in*  
*producing the raw material used by the investor corporation or in market-*  
*ing the goods of the investor corporation. Even where investment in*  
 another corporation is not of an extent to give it a control over the voting power, it is sometimes sufficient to enable it to have one or more directors on the Board of the investee company. Where such inter-locking of directors is achieved in a company in the same line of production, or a company engaged in the distribution of its product or one engaged in the production of an allied product, or of raw materials, it has clearly a tendency to increase concentration of economic power. In the period immediately following independence, the very forces which were harnessed to speed up industrialization of the country, worked at the same time to concentrate power in industry in a few individuals or families who were already wealthy and powerful. It should also be mentioned that when independence came, some British businessmen left the country. Several of their concerns passed into the hands of wealthy Indian industrialists necessarily causing an increase of concentration.

The planned economy which Government decided as the quickest way to achieve industrialization on the right lines, has proved to be potent factor for further concentration. The allocation of resources and the settlement of priorities, which planning necessarily involves, have necessitated a system of licensing for starting new industries or expanding established units or starting new units in existing industries; capital issues also had to be controlled. Big business was at an advantage in securing the required licences and was in a better position to raise large amounts of capital needed. Licensing authorities were naturally inclined to prefer men who had proved their ability by success in big industrial ventures in the past to men who had still to establish their ability. Furthermore the ability of big businessmen to secure foreign collaboration helped in obtaining industrial licences. The Commission found on examination that between 1959 and 1963, 71.6 per cent of the licences issued went to big business. The Commission said it was convinced that the system of controls by way of industrial licensing, however necessary from other points of view, had restricted the freedom of country into industry and so helped produce concentration.

In the industrial field, the Commission said that two main kinds of concentration of economic power prevailed. The first is where in respect of the production and distribution of any particular commodity or service, the controlling power, whether by reason of ownership of capital or otherwise, is in a single concern or comparatively limited number of concerns or though in a fairly large number of concerns.

These concerns themselves are controlled by only a single family or a few families or business houses; this may be called "product-wise con-

centration". Where a large number of concerns engaged in the production or distribution of different commodities are in the controlling hands of one individual or family or group of persons, whether incorporated or not, connected closely by financial or other business interests "country-wise concentration" is clearly considered to exist.

**Product-wise Concentration:** The Commission examined 1,298 products to measure concentration. It accepted concentration ratios of enterprises in terms of production as most suitable to give a correct idea of the market power exercised by top enterprises. The degree of concentration was defined by the extent of the share of top three enterprises in the manufacture of a product as given below:

|    |                      |   |                               |
|----|----------------------|---|-------------------------------|
| H: | High concentration   | : | 75% or more                   |
| M: | Medium concentration | : | 60% or more but less than 75% |
| L: | Low concentration    | : | 50% or more but less than 60% |
| N: | Nil                  | : | Below 50%                     |

Of the 1,298 products examined, 1,131 were found to have a high degree of concentration. Sixty-three came in the medium category, 31 in the low category and 73 had nil concentration.

TABLE L  
Product Concentration in 75 Business Groups

| Sl. No. | Name of Group             | No. of pds. in which the group cos. appear as one of top 5 producers | No. of pds. in which the group cos. appear as single producer | No. of pds. in which the group cos. share is between 75% and 100% | No. of pds. in which the group cos. share is between 60% and 75% | Total of columns 4, 5 and 6 |
|---------|---------------------------|----------------------------------------------------------------------|---------------------------------------------------------------|-------------------------------------------------------------------|------------------------------------------------------------------|-----------------------------|
| 1       | 2                         | 3                                                                    | 4                                                             | 5                                                                 | 6                                                                | 7                           |

| Total: |                        |    | 105 | 47 | 41 | 193 |

In addition, the Commission examined 100 products of importance to the ordinary consumer. Of these 65 products had high concentration, 10 medium, 8 low and 17 nil concentration.

The Commission has worked out the concentration ratio for 1,298 products. Of these, companies belonging to 70 groups appear as leading producers in 588 products or 45.1% of the total number of products. The remaining five business groups, namely, (1) Thiagaraja, (2) Mangaldas Parekh, (3) Kothari, G. D., (4) Modi, and (5) Kanoria, R. K. are not dominant producers in any one of the products.

**Company-wise Concentration:** In order to ascertain the extent of control or ownership exercised by industrial houses over a number of companies engaged in each line of product, the Commission evolved a definition. It took a "business group" to comprise all such concerns which are subject to the ultimate and decision-making power of the controlling interest in the group — the group master.

It examined 2,259 companies to ascertain their group affiliation to 83 groups in the Commission tentative list. Ultimately, the Commission decided on a list of 75 groups where assets were not less than Rs. 5 crores.

The assets of all the 75 groups, comprising altogether 1,536 companies totalled Rs. 2,605.95 crores. The total paid up capital is Rs. 646.32 crores.

What is the share of these groups in the total paid up capital and assets in the corporate sector? As on 31.3.1964, the total number of non-Government non-banking companies was 25,661 with a total paid up capital of Rs. 1,465.46 crores and assets valued at Rs. 5,552.14 crores. The proportion of assets of the 75 groups works out at 46.9 per cent and of paid up capital at 44.1 per cent.

To complete the picture, the Commission has drawn attention to the diversified activities of certain companies which have not been included in these groups. Leaving out companies with assets of less than Rs. 5 crores, there are at least 16 larger companies.

TABLE LI

Larger Business Groups Houses: Assets Not Less Than Rs. 5 Crores as on 31.3.1964

| Rank | Business Group/House | Total No. of Coys. in Group | Total No. of Coys. in Group with not less than Rs. 1 crore assets | Total assets of Coys. Share in Col. 4 (Rs. in lakhs) | Paid up capital, assets, and turn over of companies in the group (Rupees in lakhs) |        |           |
|------|----------------------|-----------------------------|-------------------------------------------------------------------|------------------------------------------------------|------------------------------------------------------------------------------------|--------|-----------|
|      |                      |                             |                                                                   |                                                      | Paid up Capital                                                                    | Assets | Turn-over |
| 1    | 2                    | 3                           | 4                                                                 | 5                                                    | 6                                                                                  | 7      | 8         |

| 5.             | General Electric Co. of India (P) Ltd. | 1,020                            | Ceiling fans, propeller fans, motors, meters, radios, transformers and switch fuses.                                                                                                                                                             |
| 6.             | Godrej Boyce Mfg. Co. Ltd.             | 1,057                            | Manufacturing steel furniture, typewriters, refrigerators, locks and pork-lift trucks                                                                                                                                                            |
| 7.             | Guest Keen Williams Ltd.               | 1,875                            | Special steels, steel bars, bolts, nuts, rivets, railway permanent way material, electrical stampings for fans, motors and generators, transformer laminations, pressed components and assemblies for automobiles, textile and other industries. |
| 8.             | Hindustan Lever Ltd.                   | 1,992                            | Soaps, toilet preparations, <i>vanaspati</i> , dehydrated vegetables and non-soap detergents.                                                                                                                                                    |
| 9.             | Indian Aluminium Co. Ltd.              | 2,182                            | Aluminium, ingots, rolled prevent extrusions paste, power and pyrotechnic powder, chemicals, alumina and carbon electrode paste.                                                                                                                 |
| 10.            | Indian Oxygen Ltd.                     | 1,213                            | Oxygen, dissolved acetylene, electrode gas welding and cutting equipment.                                                                                                                                                                        |

| 1   | 2                                                  | 3     | 4                                                                                                                                                                                                                                           |
|-----|----------------------------------------------------|-------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| 11. | Metal Box of India Ltd.                            | 1,082 | Containers, closures and plain/lithographed sheet metal products, industrial components, machinery, paper and board products, flexible packages and plastic products.                                                                       |
| 12. | National Insulated Cable of India Ltd.             | 555   | Bare copper wire, aluminium conductors, copper cadmium grooved conductors; cotton and paper covered wires and strips, VIR/PVC cables and flexibles.                                                                                         |
| 13. | Phillips India Ltd.                                | 895   | Radios, radio components and parts, fluorescent lamps, fittings and accessories, burners for mercury vapour lamps, electronic service and industrial measuring instrument sound equipment; tungsten and molybdenum wire and tungsten coils. |
| 14. | Siemens Engineering and Manufacturing Co. of India | 929   | Motor starters, distribution switchgear switchboards, X-Ray units; railway signals; mechanical portions of cargo winches and topping winches, HRC fuses, fuse bases, tripple pole fuse isolators.                                           |
| 15. | Union Carbide India Ltd.                           | 1,223 | Dry cells, zinc strips, flash light cases, polythylene, chemicals, cinema arc carbons, carbon electrodes.                                                                                                                                   |
| 16. | Glaxo Laboratories (India) Private Ltd.            | 1,109 | Bata Iononem, Corticosteroids, Vitamin A, Calcium sennosides, hydroxocobalamin, ointments, vaccines, antibiotic powder vials; infant milk food.                                                                                             |

**Monopolistic and Restrictive Practices:** The Commission came to the conclusion that in a large number of industries, a single undertaking is the only supplier or at least has a very large portion of the market as compared with its competitors. It has the power to dictate the price of the commodity or services it supplies and to regulate its volume of production in such a manner as to maximize its profits — monopoly power. Monopoly, according to the Commission, would include not only the single supplier in a market but also the one dominant supplier who dictates the market price. It emphasizes that when such a power is shared by a few enterprises as dominant sellers, they should be considered as holding a monopolistic position.

A distinction has been drawn by the Commission between "monopolistic practice" and "restrictive practice" while conceding that on the face of it every monopolistic practice is a restrictive practice. It explains that every practice whether it is by action, or understanding or agreement, formal or informal, to which persons enjoying monopoly power, resort in exercise of the same, to reap the benefits of that power and every action, understanding or agreement, tending to or calculated to preserve, increase or consolidate that power should properly be

designated monopolistic practice. Similarly a restrictive practice means practices other than those preserved by monopolists which obstruct the free play of competitive forces or impede the free flow of capital or resources into the stream of production or of the finished goods in the stream in distribution at any point before they reach the hands of the ultimate consumer. The Commission analyses the various ways in which industrialists in India resort to monopolistic and restrictive practices and says these are attempts by monopolists and near monopolists to keep out or crush competitors.

The bright picture of what concentrated economic power has achieved in the past and is fairly certain to achieve in the future, says the Commission, must not make us blind to certain evil effects of such power on the country's economy. The most serious of these, it points out, is the risk of the emergence of monopoly with its attendant evils and keeping out the small industrialists. "Big business" by its very "bigness" sometimes succeeds in keeping out competitors. "The statements made before us by some small businessmen have convinced us that both price wars and threats have been used by dominant *entrepreneurs* in India, with a view to maintaining their domination," the Commission has observed. It adds, "The dangers from concentrated economic power and monopolistic and restrictive practices are not imaginary but do exist in a large measure either at present or potentially. We are clearly of opinion that a permanent body should be set up with the duty and responsibility for exercising vigilance and for taking action to protect the country against the dangers that we think do exist."

Accordingly, the Commission in its report has included a draft bill for the purpose.

**Statutory Commission:** Subsequently in 1967 Government introduced in Parliament its own Bill called "The Monopolies and Restrictive Trade Practices Bill" which was finally passed and assented to by the President on December 27, 1969. In 1970, the Monopolies and Restrictive Trade Practices Commission was set up with a High Court judge as chairman and two members.

Under the Act, the Commission has an advisory role in matters concerning expansion, diversification, mergers and amalgamations as well as monopolistic practices. It has mandatory powers in respect of restrictive trade practices.

The Act does not apply to banking and insurance companies to the extent they overlap with the provisions of the special enactment governing them. It also does not apply to Government or Government controlled undertakings.

The Act *inter alia* provides for:

- (1) Regulating expansion, mergers and amalgamations and appoint-

ment of Directors in respect of dominant undertakings having assets of Rs. 1 crore and above and of undertakings, which by themselves or with inter-connected undertakings have assets of not less than Rs. 20 crores in value.

- (2) Regulating the starting of new undertakings which would become inter-connected undertakings the total assets of which exceed Rs. 20 crores.
- (3) Control over and prohibition of monopolistic and restrictive trade practices as are found to be prejudicial to public interest.

The Commission has been vested with the powers of a civil court under the Civil Procedure Code.

The Commission also made several recommendations which are non-legislative in character. A very important recommendation relates to the industrial licensing system. While conceding that at the present stage its abolition is not practicable, it suggests that licensing policy should be liberalized. It should be made easy for the comparatively smaller *entrepreneurs* to get industrial and import licences expeditiously and without undue expenditure. Licensing, the Commission points out, can be used to good purpose by Government in fighting concentration wherever necessary.

**Role of Licensing System:** Meanwhile, Government's industrial licensing system was the subject of official study as well as of public discussion. A study made on behalf of the Planning Commission revealed that the large and medium sized business groups enjoyed a higher ratio of approval in industrial applications as compared to others and that their share in the investment applied for and approved had tended to rise over the period. This was certainly true about certain Business Houses, the most important of which, according to the Study, was the House of Birlas. When this matter came up in Parliament in May 1967, Government announced that a Committee would be appointed to go into the basic questions regarding the functioning of licensing system and any advantages obtained through it by some of the large industrial houses.

The Industrial Licensing Policy Inquiry Committee was set up a few weeks later. In its report in 1969, the Dutt Committee, so named after its Chairman, observed that in the earlier years, licensing was guided more by technical than by economic, leave alone, social considerations. Not only no attempt was made to use licensing to prevent the further growth of the larger industrial houses, but the process actually worked in their favour. Even after the Monopolies Inquiry Commission had made its report, no clear question was issued to the licensing authorities and the financial institutions as to how they should treat applicants from large houses.

The licensing system worked in such a way as to provide a dispro-

portionate share in the newly licensed capacity to a few concerns belonging to the large industrial sector, the most prominent among them being the Birlas. The Committee found no justification for the disproportionate share obtained by these Houses.

A large proportion, nearly 32 per cent of the licences issued during the period 1956-66 were not implemented. Non-implementation of a licence for products where there is interest and competition is a definite indication of pre-emption. The Committee found that among the Houses which were responsible for various forms of pre-emption, the most prominent was Birlas. They held the largest number of unimplemented licences, made repeated attempts to obtain a large number of licences for many products, created excess capacities and tried to have them regularized afterwards and also produced more than authorized capacities.

In spite of its failure and defects the Committee was of the view that the licensing system must continue if industrial development was to take place as part of an overall development plan. The Committee held that licensing had only a small role to play in preventing concentration of economic power. The major instrument for obtaining the objective was the Monopolies and Restrictive Trade Practices Commission.

**Financial Institutions:** The Dutt Committee has dealt with the role of public financial institutions with reference to the prevention of the concentration of economic power on the one hand and the growth of the public sector on the other. The objective contemplated in the Industrial Policy Resolution of 1956, that the State would play an increasingly active role in a number of newly developing industries had not been achieved to any significant extent. On the other hand, investment funds of the Life Insurance Corporation which could be made available to the priority industries in the public sector had been diverted to the private sector. A number of new industrial projects in the private sector had been established only on the basis of a large proportion of their costs being met through assistance provided by public financial institutions. In many concerns, the State, through the L.I.C. and other financial institutions held significant proportions of equity capital. But this equity had not been utilized for effective participation in the management of these concerns. By providing a large part of the assistance as debentures or loans, the public financial institutions had also denied themselves a share in capital appreciation. The Committee urged a thorough change in these policies. Where a very large proportion of the cost of a new project was to be met by public financial institutions, it wanted these projects to be set up in the public sector. Ordinary shareholders and even some private

concerns could be associated with them and the Companies Act did provide for it. In such an event the Committee recommended that the projects should be in what it called the Joint Sector. One important advantage of the joint sector project was that the Large Industrial Sector would not be permitted to build up huge industrial empires. In a joint sector project, there should be proper representation for the State in the management. The financial institutions could insist on the whole or part of the assistance given by them as loans and debentures being converted into equity. The equity holdings of public financial institutions including the L.I.C. and the Unit Trust of India should be effectively used for enlarging the role of the State in the management of private sector industry.

**Industrial Planning:** The need for detailed industry plans for licensing has also been emphasized by the Committee: Such planning was essential, said the Committee for licensing, to be used as a positive instrument for co-ordinated and planned development. Without detailed planning, decisions on applications for licences, whether in terms of size, technical process or location would continue to be *ad hoc* and purely discretionary in character. In that situation existing faults in the licensing system could not be avoided.

In the present circumstances the Committee would like the use of industrial licensing as a positive instrument only for the basic, strategic and critical sectors — the 'core' sector — for which industry plans should be drawn up. A system of reservations and bans could be used for preventing undersizeable developments. The present policy of reserving certain areas of production for small and medium industries was right and should be continued. Bans on the creation of further capacity should be used for preventing the development of non-essential luxury goods which made large drafts on scarce resources. Negatively bans could be useful for regional dispersal of industries and thus avoid industrial concentration in metropolitan areas.

Limited use of licensing has been recommended in the 'middle' sector which is neither included in the 'core' sector nor in the 'Reservations' and 'Bans'. This the Committee felt was necessary to prevent the 'Larger House' or foreign concerns dominating the sector.

Since receiving the Committee's report, Government has taken action to streamline and simplify the licensing system and to lay down guidance for public financial institutions giving term loans to the private sector.

**Sarkar Commission:** Government also set up in February 1970, a one-man Commission of Inquiry headed by A. K. Sarkar, former Chief Justice of India in respect of certain findings of the Dutt Committee

on the Large Industrial Houses especially the Birlas. These are:

1. Irregularities, lapses or improprieties said to have taken place in the grant, utilization and implementation of industrial licences.
2. The financial assistance given by public financial distributions has gone to a large extent to certain groups which have benefited most.
3. Allegations of the exercise of undue influence by the Birla group of concerns on/or obtaining of undue favours from Government of industrial licences, gross irregularities in the management of these concerns amounting in many cases to contravention of law and of other improprieties or illegalities.

### VII. Industrial Finance

In the early years of this century, there were only two institutional sources of industrial finance within the country, viz., managing agents and banks. There was no capital market in the proper sense of the term though stock exchanges existed in Calcutta and Bombay. Both long and short term finance was raised by promoters from their own resources (personal taxes, if any, were nominal and profits were high) or from relatives and friends — and princes and zamindars. Banks provided accommodation mainly for the financing of external trade; their assistance to industry was confined to export commodities and that, too, largely to European houses which were able and willing to satisfy the banks about their creditworthiness.

Indian businessmen, (as became clear in the course of evidence before the Central Banking Enquiry Committee (CBEC), as late as the thirties) were generally averse to the idea of submitting their affairs to bank scrutiny and of pledging or hypothecating their assets. The precise role of managing agents as financiers at that time — or till the fifties for that matter — cannot be quantified. It can be safely assumed, nevertheless, that in most cases they provided the bulk of finance at that time; in some companies, however, they acted almost wholly as local managers for foreign investors.

While banks were traditionally chary of financing the needs of industry as distinct from trade, there were two periods when some new Indian banks took a keen interest in long term financing. In the seven year period, 1906-13, the banks which rose on the crest of the Swadeshi wave, freely subscribed to the shares and debentures of industrial companies and advanced what were, by contemporary standards, large amounts on the security of fixed assets, often to the concerns in which their promoters were interested. Prominent among these banks were People's Bank, Indian Specie Bank, Hindusthan Bank, Lahore Bank, Doaba Bank, Marwar Bank, Industrial Bank and Credit Bank of India.

Nearly all of them had a narrow capital base as their deposits were all short term. They violated every known principle of investment banking and made imprudent and reckless loans. There was a severe banking crisis in 1913-15; no less than 34 per cent of the paid-up share capital of banks was lost; the depositors recovered their money largely from shareholders (bank shares were generally partly paid-up), not from the assets of borrowers.

**Four Industrial Banks:** Industrial banks were the rage between 1917 and 1923. The Tata Industrial Bank was established in 1917 with a share capital of Rs. 2.25 crores, Calcutta Industrial Bank in 1919 with Rs. 80 lakhs, Industrial Bank of Western India, also in 1919 with Rs. 40 lakhs and Karnani Industrial Bank in 1921 with Rs. 60 lakhs. The Tata Bank was set up to finance the development of new and existing industries, to promote industrial companies and support them by underwriting their shares and debentures, and to be always prepared to retain a considerable holding of shares in such companies, as an earnest of its belief in the bona fides and prospects of the companies concerned. It set up a subsidiary to finance certain subsidiary companies, undertook every description of banking business, and opened twelve branches. Its investments soon depreciated heavily and the bank was merged in the Central Bank of India in 1923. In spite of its relatively large capital base, its resources were mainly short term; moreover, the investments were not properly assessed and the principle of holding on to large investments, especially in other Tata Companies proved misconceived. The other Industrial Banks were managed even worse and faded out soon.

The history of somewhat crystallized thinking on the need for what were then described as industrial banks dates back to the advice of the Bombay Advisory Committee of the Indian Industrial Commission 1916-18, which favoured "the establishment of a central industrial bank or similar organization with a large capital and numerous branches, designed to afford financial support to industries for longer periods and on less restricted security than is within the power or practice of existing banks. Such a bank would probably require a measure of Government support, but should not be brought under rigid Government control." That this plea should have been made in the second decade of the century and in Bombay is interesting. War demand, larger Government purchases in India and a considerable degree of success in running cotton, jute and coal undertakings had created prospects of large scale industrialization, for which the resources of eager promoters and their friends were no longer sufficient. The capital market was still undeveloped, notwithstanding the exceptional successes which a few concerns like Tata Iron and Steel had achieved in raising capital from the market. Resort

to bank finance was unpopular; the more reputable banks were not, in any event, interested in extending long term finance to industries, particularly to units under Indian management. Business houses in Calcutta, being mostly foreign, had ready access to British investors, a source which could not be tapped by Bombay and Ahmadabad industrialists.

**Recommendations of Commission:** The Industrial Commission considered the question of the best agency for the provision of initial and current finance for industries. It rejected the idea of an industrial trust or financial corporation on the ground that it would be too directly concerned in the success of particular undertakings to be a suitable instrument for the general advancement of industries, though it could be a useful agency for furthering particular industrial interests. The Commission preferred an industrial bank which, if wisely conducted, "is benefited by an increase in the number of individual undertakings, and it can, to some extent, prevent their extension beyond the safety point." While suggesting the early appointment of an expert committee to consider the form of Government assistance to and regulation of, additional financial facilities, whether central or provincial or both, it expressed the view that

"an industrial bank should possess a paid-up share or debenture capital high in proportion to its total business; it should observe the usual precautions of not allowing too large a share of its funds to be used for the benefit of any single interest or group of financially inter-dependant interests; its loans on plant building and land should be carefully considered and should be limited in each case; the larger portion of its industrial business should be confined to the provision of working capital; it should provide initial capital with caution, at any rate during its opening years, and should not itself attempt to promote companies, though it may advise and assist in other ways persons who propose to do so. The main factor of safety in an industrial bank is the judicious limitation of each class of business to its proper proportions."

**State Aid to Industries Act:** It is, perhaps, more than a coincidence that the initial set up of the Industrial Finance Corporation of India established thirty years later conformed remarkably to these recommendations, except that it did not emphasize working capital and did lend a large part of its funds to one industry, namely, sugar. The Commission went on to suggest a scheme for aid to small industries which culminated in State Aid to Industries Acts/Rules in various provinces. As regards large industrial undertakings, the Commission believed that, if adequate technical advice and an undertaking to purchase output were provided by Government, private funds would be forthcoming without

Government aid in the majority of cases. Financial aid for projects required for national safety should come exclusively from the Centre and for others from Provincial Governments (subject to Central sanction) where they had the necessary expert staff. Government assistance, the Commission suggested, may take the form of guarantees of dividends, or loans or assurance to purchase output and, only in cases of enterprises "of importance to national safety" where sufficient private capital is not secured, participation in share capital. Subventions for the payment of guaranteed dividends should be refunded from the future profits of the enterprise when they reach a predetermined percentage and the guarantee should be only for a limited period. Loans were held suitable for concerns with assets of a comparatively liquid nature but need not be confined to these if Government was fully satisfied about the prospects of the undertaking. Agreements to purchase output could be freely given to concerns manufacturing articles not previously made in the country but should be limited in time and accompanied by suitable conditions governing quality and price.

As a safeguard, in all cases of direct assistance, Government was to satisfy itself about the financial status of the promoter and the economic and technical aspects of the proposed industry and secure rights of inspection and audit and nomination of directors but without involving Government interference in their working. The capital of assisted enterprises should be raised in India in rupees and allotment of shares should be such as to enable small investors and the Indian public to participate. While there need be "no limitation on Government aid to a new enterprise, on the ground of its competing with an established external trade" it would be desirable to secure a *quid pro quo* in the shape of preference to Government orders or acceptance of a certain number of apprentices, etc.

In the twenties, a number of provinces enacted legislation for aid to small industries but the results of the little aid provided did not come upto expectations. Some assistance was also extended to large enterprises, notably in Madras (Tamil Nadu), Bihar and Orissa, Bengal and the United Provinces (Uttar Pradesh). Included in these were the Tamil Nadu Government loan of Rs. 474,000 and guarantee for overdraft of Rs. 134,000 to Carnatic Paper Mills between 1925 and 1928; but in the year 1928, Government had to take possession of its assets. Bihar and Orissa investment of Rs. 5 lakhs in Indian Steel Wire Products failed, to rescue the company. Uttar Pradesh gave loans to five concerns between 1922 and 1925, ranging from Rs. 80,000 to Rs. 600,000, (total Rs. 13 lakhs) but all the five enterprises foundered. A Bengal loan of Rs. 8 lakhs to a paper company in 1924-25 was actually an advance payment for orders placed; but it saved the company from external competition.

**Advance Factors:** The implementation of the recommendations of the Industrial Commission was bedevilled by a number of factors. The post-war boom in industrial and banking flotations completely petered out by 1923, thereby eroding public confidence in new enterprises. Consistent decline in agricultural prices and adverse terms of trade reduced internal purchasing power. Cheap imports from foreign countries made the establishment of new industries difficult and raised demands even from existing industries for protection, which Indian industrialists (especially those who went into sugar in the thirties) soon found more useful than irksome and miniscule financial aid from Government. Local enterprise found a safe haven in traditional industries, cotton, jute, tea, coal and minor light engineering, which despite difficult times, had a reasonably assured level of internal demand and could also raise capital with comparative ease. Government, too, was none too eager to lend a helping hand since it was worried about its own finances.

**Long Term Industrial Financing:** The question of long term financing of industry was raised at length before the Central Banking Enquiry Committee which, however, made only two broad recommendations in this connection: (i) 10 per cent of the capital and reserves of the Imperial Bank and nine other large banks could be utilized for investment in the shares and debentures of industrial companies and (ii) central and/or provincial industrial banks could be set up with Government participation in the share capital to provide limited assistance to industries. Neither of these recommendations was acted upon.

In the absence of any specialized financial institutions, industry fell back upon subscriptions and deposits from the public and, beginning with the early forties, banks, too. The exact pattern of the sources of industrial finance through the thirties and forties is not known due to lack of data. In the western region, i.e., Bombay and Ahmadabad, public deposits were an important source of finance. According to the Central Banking Enquiry Committee, total unsecured loans (mostly deposits) of Bombay cotton mills in March 1924 amounted to nearly Rs. 12 crores, which declined to less than Rs. 3 crores in October 1930, when the industry was in a depressed condition, but which came even then to 11 per cent of their total finances. In Ahmadabad, public deposits provided nearly 40 per cent of the financial requirement of cotton mills in 1930.

In Bombay, the deposits were mostly for six to twelve months and the rates of interest varied from  $4\frac{1}{2}$  to  $6\frac{1}{2}$  per cent. Loans from banks were personally guaranteed by managing agents and also secured collaterally against hypothecation (not pledge) of the liquid assets of the borrowing companies. In some cases, the managing agents provided finance in consideration for acting as buying and selling agents of the managed

companies. The deposit system in Ahmadabad was more elaborate, partly because many of the reputable managing agents were originally bankers and attracted many rural depositors also. The older mills normally raised one-year deposits but the newer ones accepted deposits upto 7 years and offered in return a share in the managing agency commission and, later, shares in the managing agency company than the managing agents incorporated themselves. Deposits varied from five to ten thousand rupees on the average. In the days of prosperity, when mills accumulated large funds, the practice grew of inter-depositing, which replaced deposits from rural areas as they fell off after the slump in agricultural prices.

In Calcutta, the needs of European business houses were met largely by banks and in so far as their managing agents substantially reduced their holdings of share capital, the Indian public (mostly zamindars and prosperous traders) avidly took them up. The guarantees of Calcutta managing agents were not personal or unlimited as in Bombay but were merely a certificate to the effect that loans were always covered by stocks. The needs of small tea gardens and coal mines were met largely by zamindars and money-lenders.

This pattern of financing could be availed of only by traditional industries, in which alone banks and public depositors had confidence. New industries had little chance.

**Post-War Plenty:** During and immediately after the Second World War, industrial finance was not much of a problem, though the requirements of cotton, jute and iron and steel for rehabilitation and modernization were large and were not matched by adequate internal resources. Equipment was difficult to get. Most companies had build up large liquid balances or were entitled to refund of Excess Profits Tax deposits. General liquidity in the economy assured the success of public issues (there was a remarkable boom in 1946 followed by its inevitable aftermath) and the circulation of large amounts of concealed wealth and income provided abundant funds. Banks, too, were flushed with funds, their liquidity ratio being as high as 80 per cent. The partition and political disturbances which followed also kept down the pace of industrial investment. The availability of entrepreneurial finance was, in fact, large enough to enable several Indian business houses to buy out many European managements in leading centres at fabulous prices.

Data on the sources and uses of funds in the corporate sector were collected for the first time by the Taxation Enquiry Commission 1953-54. Its analysis of the finances of 407 selected public companies during the period 1946-51 disclosed that they raised about one-half of gross total funds internally, depreciation and EPT refunds contributing a large proportion. The external funds came in large measure from share capital

and bank loans. About one-half of the funds raised went into fixed assets and one-third into inventory. Investment in Government securities was substantially reduced and cash balances were raised considerably.

In the period 1951-54, which corresponded roughly with the First Five Year Plan, public companies relied to a much greater extent upon internal resources (depreciation contributing one-third of gross total funds) and short term trade credits, much less upon banks. A much higher proportion, 62 per cent against 49 per cent in 1946-51, of gross total funds was invested in fixed assets and less than 13 per cent in inventory. Liquidity was still not unduly strained; cash balances and investments in other companies went up significantly.

**Industrial Finance Since 1951:** The First Five Year Plan was mainly a rationalization of the projects already in existence. The programme for large scale industry envisaged a total capital expenditure over 1951-56 of Rs. 477 crores, Rs. 94 crores in the public sector including an expected foreign and domestic participation of Rs. 20 crores, and private investment of Rs. 233 crores, exclusive of Rs. 150 crores for replacement and modernization of plant and machinery. Finances for public enterprises were to be raised by Government investments and loans. No precise estimates were made of the sources of finance for private investment. The various sources merely enumerated Government and World Bank loans, foreign capital and financial institutions. The actual achievement was Rs. 57 crores in the public sector, and Rs. 340 crores, including Rs. 150 crores on modernization and rehabilitation, in the private sector.

The programmed expenditure on industries (excluding minerals, oil and plantations) during the Second Plan (1956-61) was Rs. 1,100 crores, plus Rs. 150 crores for modernization and replacement, of which Rs. 620 crores was to be in the private sector. Actual private investment, according to Planning Commission estimates, came to Rs. 850 crores.

The higher than expected level of financial achievement (though physical targets realized were only 85 to 90 per cent) was made possible by the larger inflow of external capital, buoyancy of the capital market and greater assistance from financial institutions. More comprehensive data for the corporate private sector as a whole given by the Reserve Bank indicate that, among domestic sources, banks provided the major part of external financing. Internal sources, *i.e.* depreciation and retained earnings, provided 53 per cent of gross total financing. Finance corporations played a very minor role.

Institutional agencies as a source of external finance for industry have grown steadily in importance since 1955. This has taken the form of

larger bank loans and to some extent investments, substantially greater assistance from the Life Insurance Corporation of India, the Industrial Finance Corporation of India and the Industrial Credit and Investment Corporation of India, together with other financial institutions. One of the yawning gaps in the institutional structure of the capital market, namely, the practical absence of underwriting facilities, has been largely filled by now.

**Insurance Companies:** Before proceeding to the somewhat detailed analysis of institutional developments, the growth of assistance from insurance companies and banks to industry may be briefly recorded here. The earliest data on investments by insurance companies date back to 1913, when they had invested Rs. 11 lakhs only in shares and debentures. This figure grew to Rs. 4.38 crores on the eve of the Second World War and to Rs. 13.04 crores at its conclusion in 1945. The total investment before nationalization of life insurance was nearly Rs. 59 crores.

The explanation for the rather low level of insurance investments in private securities lies in (i) the slow growth of insurance business itself; (ii) the practice, moderated only since the mid-fifties, of investing heavily in Government securities, and (iii) the relatively small number of private securities traded in the capital market till 1960.

**Banking in Two Decades:** The twenty years spanning 1949 and 1969 are a major landmark in the history of banking in India. It was in the year 1949 that the Banking Regulation Act was passed and in 1969 fourteen major commercial banks were nationalized. These two decades also covered the first era of planned economic development in which the banking system sought to adapt itself to the major changes in banking structure and policy.

The credit portfolio of scheduled banks rose faster (550 per cent) than deposits (420 per cent) in these twenty years. This sharper expansion reflects the pace of growth in the organized industrial sector. The banks had largely catered to this sector which in turn had put increasing reliance on bank credit in proportion to other sources of funds. Consequently, as a proportion of total credit, lending to industry rose from about a third (Rs. 152 crores) in 1950 to over two thirds (Rs. 2,068 crores) in 1968.

Within the industrial sector, the share of industries such as iron and steel, engineering, chemicals, cement and textiles showed significant increases. Out of a total of Rs. 2,068 crores (1968) as industrial advances Rs. 114 crores was given to State owned or State managed industrial concerns. Nearly 85 per cent of this credit amount went to public sector engineering, iron and steel, fertilizer and fuel oil manufacturing

industries and mining and electricity generation and distribution concerns.

Other public sector industrial concerns which received bank credit were sugar, cotton textiles, chemical products, cement construction and shipping concerns.

In this context must be mentioned the emergence of banks as term lending institutions in the last few years. Fifteen years earlier, they confined themselves to the short term credit needs of industry. With the establishment of the Refinance Corporation for Industry (subsequently replaced by the Industrial Development Bank of India), banks have been able to increase their involvement in this sector. This is in addition to the contribution made by the banking system to the capital stock and debentures of the specialized financial institutions.

**Objectives of Nationalized Banks:** Nationalization of Banks came into force on July 19, 1969 and its broad aims promised a fair deal to the hitherto neglected sections of the community. The preamble to the Act says: "to control the heights of the economy and to meet progressively and serve better the needs of development of the economy in conformity with national policy and objectives." It will be the endeavour of the nationalized banks to ensure that the needs of productive efforts of diverse kinds, irrespective of size and social status of the borrower and in particular those of farmers, small scale industries and self-employed professional groups are met in an increasing measure. It will also be a primary objective of nationalized banks to foster actively the growth of new and progressive *entrepreneurs* and to create fresh opportunities for backward areas in different parts of the country.

These objectives called for extensive changes in the bank's attitudes and methods of work. Particularly, it became necessary for them to reorient the concept of security for loans to pay special attention to the growth potential and developmental needs of local areas where the branches are situated, to take better care of underdeveloped areas and backward sections of the population, to forge close relations with developmental and term financing institutions, to ensure that large borrowers do not have more access to the resources of the banks than is actually required for production use and to prevent use of credit for speculative and unproductive purposes.

**Credit Guarantee Scheme:** In order to cover the credit risks incurred by banks in granting loans to small scale industries, the ten year old Central Government's Credit Guarantee Scheme was modified and brought into force on February 1970. Under the modified scheme, the guarantee is made available to all eligible advances on an automatic

basis in terms of an agreement executed by each approved credit institution with the Guarantee Organization. The credit institutions which join the scheme are required to report all their eligible advances at quarterly intervals which form the basis for changing the guarantee fee at one tenth of one per cent per annum on a quarterly basis. This change in procedure is expected to expedite the flow of institutional credit to the small scale sector, particularly the weaker units.

At the suggestion of the Guarantee Organization, 74 banks and 16 State financial corporations have agreed to bear themselves the guarantee fee instead of recovering it from their constituents. With these guarantee facilities, credit institutions are expected to liberalize where necessary, their terms of lending, particularly in regard to margin requirements. Soft loans or loans on clean basis, wherever deserving, might be extended especially for schemes promoted by qualified technicians/*entrepreneurs*. Where there is a default, the Guarantee Organization makes a swift examination of the possibility of its rehabilitation. In deserving cases the credit institution is urged to take on a programme of nursing.

By the end of June 1971, 149 credit institutions including all the major commercial banks and state financial corporations and 56 co-operative banks had joined the modified scheme. The amount of guarantees outstanding on that date stood at Rs. 790.97 crores as against Rs. 661.77 crores at the corresponding period in the previous year. Since the inception of the guarantee scheme (two years ago) claims of 200 guarantee obligations for an aggregate sum of Rs. 27.15 lakhs were paid to the credit institutions. However, at the end of March 1971, defaults which might eventually lead to settlement of claims, covered 1,799 cases for Rs. 589.04 lakhs as against 463 cases for Rs. 141.97 lakhs at the end of June 1970.

**Small Scale Sector:** Bank credit to small scale industries has also been growing in the second decade of 1949-69. Between 1960 and 1968, it had risen from Rs. 28 crores to Rs. 211 crores, and by the middle of 1969, it had further gone up to around Rs. 295 crores, thanks to the special efforts of the banks. The tempo was maintained and by March 1971, total credit limits sanctioned reached the figure of Rs. 868.3 crores over and above the increase of Rs. 156.8 crores in the corresponding period of 1969-70. The number of units financed rose from 89,307 to 103,550, that is to say by 15.9 per cent.

The share of industrially backward states in advances to small scale industries has gone up since June 1968, the increase being particularly marked in Andhra Pradesh, Bihar and Uttar Pradesh.

**Public Sector Banks:** The banks in the public sector accounted for

89 per cent of the total outstanding credit to small scale industries, the share of the State Bank of India group being 40 per cent. This group sanctioned credit limits of Rs. 320.4 crores which was Rs 28 crores over the 1970 level. The contribution of the 14 nationalized banks amounted to Rs. 459 crores at the end of March 1971, a rise of Rs. 47 crores.

Loans sanctioned by the State Bank group under their scheme for financing craftsmen and other qualified *entrepreneurs* amounted to Rs. 7.1 crores covering 562 units. This was more than double the quantum of loan and number of units in 1970.

Following the State Bank's lead, a number of banks, including some nationalized banks have drawn up special schemes for assisting qualified *entrepreneurs* who have worthwhile small scale industrial projects but do not have the finance. According to information available, seven nationalized banks had under their own schemes, sanctioned Rs. 1.35 crores covering 540 *entrepreneurs* as at the beginning of December 1970.

TABLE LIII  
Bank Assistance to Industry

|                |                                         | Rs. in crores |                     |          |                     |

**Life Insurance Corporation of India:** The total investments of Insurance Companies in India at the end of December 1955 amounted to Rs. 58.90 crores. This was before nationalization of Life Insurance in 1956. As of March 1970, the total investments of the Life Insurance Corporation of India amounted to Rs. 1,528.66 crores. This includes Rs. 14.40 crores, the share of its General Insurance Department. Investments in Stock Exchange securities, loans and contribution to the initial capital of Unit Trust of India was Rs. 1420.10 crores. Of this amount, nearly Rs. 238 crores were invested in the shares and debentures of financial institutions which in turn assist private industry and co-operative credit institutions. An amount of Rs. 234 crores was invested in the shares and debentures of joint stock companies and Rs 5.37 crores in a joint sector undertaking.

Within the limitations of availability of sound proposals and adequately remunerative existing scrips, Life Insurance Corporation has made a conscious attempt to diversify investments both by States and industries in such a manner as to favour the relatively underdeveloped States and new industries. Even to the extent that it has purchased securities of traditional industries, in the open market, it has released funds for investments elsewhere.

The Corporation has also taken considerable interest in underwriting fresh capital issues. From its establishment in September 1956 through June 1971, Life Insurance Corporation's underwriting of new issues valued at over Rs. 150 crores.

**Underwriting of Private Sector Capital Issues:** The total value of capital issues through prospectus by non-Government public limited companies was Rs. 45.1 crores in 1956. The proportion of issues underwritten by different financing institutions rose from 5 per cent in 1956 to as much as 71.3 per cent in 1969-70. While the non-institutional sources in brokers and investment companies took up between 13 and 18 per cent

n.a. — Not available

of the underwritings during 1965-66 through 1969-70, the bulk of the balance was taken up by the Life Insurance Corporation, the Unit Trust of India, the Industrial Credit and Investment Corporation of India in that order. As the largest underwriter in this category the Life Insurance Corporation's percentage has varied between 21 and 24. The Industrial Development Bank of India which went in for underwriting upto 15 per cent in 1965-66 has been tapering off in the next three years. Next to the Life Insurance Corporation the Unit Trust of India has entered the underwriting operation in a massive way. Its share after a modest start, has gone up to 20 per cent and above in 1968-69 and 1969-70.

The main point of note is that the amounts underwritten have tended to grow steadily and the institutional underwriters have increased in number and become stronger.

In the period between 1966 and 1970, the response of the general

public has not been adequate. During the four year period response of the public reached a little over one-third of the total issue. In the next three years it has been less than 30 per cent and the institutions had to step in to make good the shortfall either as independent subscribers to the issue or in their capacity as underwriters.

### VIII. Financial Institutions

Beginning with the Industrial Finance Corporation of India (I.F.C.) in 1948, a number of institutions have been set up to provide long and medium-term finance to private industry. Apart from I.F.C. (there are the Industrial Credit and Investment Corporation of India (I.C.I.C.I.), National Industrial Development Corporation (N.I.D.C.), National Small Industries Corporation (N.S.I.C.), Refinance Corporation for Industry, State Financial Corporations (S.F.Cs.), and State Industrial Development Corporations (S.I.D.Cs.). In July 1964, two new institutions came into existence; the Industrial Development Bank of India (I.D.B.I.) and the Unit Trust of India. The functions of some of these institutions overlap but, by and large, they operate in different fields or owe their separate existence to certain unique background factors.

The Industrial Finance Corporation is a statutory corporation which gives mainly long-term mortgage-type rupee loans to large and medium sized concerns, organized as public limited companies or co-operatives. Most of its loans have gone to established industries like sugar, paper, cotton textiles, chemicals, and metal products. For some years now, it has also gone to some extent into foreign currency loans, guarantee of deferred payments and loans, and underwriting of public issues of share capital.

The Industrial Credit and Investment Corporation of India (I.C.I.C.I.) was registered as a joint stock company in January 1955, sponsored first by the U.S. Aid Mission in India and later by the World Bank. The Government has no participation in its share capital but has advanced Rs. 31.41 crores as loans, of which Rs. 7.5 crores is interest-free and ranks after equity and all other liabilities for repayment. U.S., U.K., and West German interests have participation in its share capital. Its principal business is to give foreign currency loans and underwrite public issues. It also gives mortgage-type rupee loans and subscribes directly to share capital. Most of its assistance has gone to new industries like ferrous metal products, chemicals, machinery manufacture, and electrical equipment.

Both I.F.C. and I.C.I.C.I. are national development banks, and though their spheres of activity have increasingly overlapped of late, but because of the vast territory open to both, on the whole, there has grown more co-ordination than competition. The two have co-operated, along with other financing agencies, in joint underwriting and loan operations and in general consultation.

The original reason for setting up I.C.I.C.I. seven years after the establishment of I.F.C. was that the U.S. aid mission and the World Bank wanted to sponsor and finance a private non-statutory body which would among other things, transact business which I.F.C. then could not take up under

**TABLE LXI**

| Total:                           | 365.68                                | 100.0      | 274.62                                | 92.8       |

its charter. For some time thereafter, the two operated in different fields. Over the last several years, however, private business has expanded and diversified so rapidly and foreign exchange has become so scarce that both I.F.C. and I.C.I.C.I. have had to widen their spheres of activity, thus resulting in some functional overlap. The financial needs of private industry are, however, so large and diverse that there is room for more than one development bank. Moreover, each of the institutions has carved out a place for itself among various industrial and regional groups.

With regard to ownership, I.F.C. is in the public sector and I.C.I.C.I. in the private sector. The latter, however, has also received considerable Government assistance in the form of loans and the Life Insurance Corporation is its largest single shareholder. I.C.I.C.I. has much larger foreign currency resources both absolutely and in relation to total resources, though this difference is narrowing down somewhat as I.F.C. acquires more foreign currency resources. Because it is seven years older, because of its public obligations (*e.g.*, assistance for cooperative sugar mills), and because it gives individually larger loans on the overage, I.F.C. has done much more business than I.C.I.C.I.

**Policy Changes:** Following the recommendations of the Industrial Licences Policy Inquiry Committee, the Central Government, in January 1970, made certain changes in policy in regard to assistance from public financial institutions. Having accepted the joint sector concept (a recommendation of the Inquiry Committee), Government decided that there should be a greater degree of participation by the institutions in management, particularly at policy levels, in the case of major projects involving substantial assistance.

Government also decided that public financial institutions should as part of their arrangement regarding future loans exercise the option for converting loans and debentures into equity, either wholly or partly. In respect of current loans or debentures, financial institutions should have discretion to negotiate conversion in cases of default. In all cases where such conversion has been effected, there should be provision for nomination of Directors on the Boards of the assisted concerns. Guidelines have accordingly been given by Government to the all-India financial institutions namely: the Industrial Development Bank of India, the Industrial Credit and Investment Corporation of India, the Industrial Finance Corporation of India, the Life Insurance Corporation of India and the Unit Trust of India.

In terms of these guidelines, it has become obligatory on those institutions normally to affiliate a condition for option to convert a part of the loan into equity in all cases where the aggregate financial assistance exceeds Rs. 50 lakhs. In cases where the aggregate exceeds Rs. 25 lakhs but does not exceed Rs. 50 lakhs, the condition for the inclusion of the

convertibility clause has been left to the discretion of the financial institutions.

The convertibility clause will not apply to sub-loans in foreign currency granted by Indian financial institutions out of foreign currency lines of credit made available directly to them by foreign institutions. But the clause will apply to all loan agreements/debentures issued covering rupee assistance from the financial institutions to industrial concerns to enable them to purchase foreign exchange from foreign lines of credit operated by the Government of India or from any other source abroad.

In settling the terms of conversion, consideration will be given to factors such as the nature and importance of the industry, the likely gestation period of the project, the debt-equity gearing, the projected profit potential, prospects of expansion, etc. In respect of existing companies with resource created out of past profits, in fixing the issue price of the share, consideration will be given to factors such as the market value of the share, break-up value, dividend record, current and projected profitability, etc. I.F.C. assistance is, regionally, more dispersed than that of I.C.I.C.I, partly in pursuance of a Government directive to it. The distribution of their assistance by industries indicates that both have a diversified portfolio, though I.F.C. has a larger concentration of interest in lighter industries.

**Industrial Finance Corporation of India:** The Industrial Finance Corporation is the largest and the oldest long-term industrial financing institution in India. It was set up in 1948 by an Act of Parliament "for the purpose of making medium and long-term credits more readily available to industrial concerns in India, particularly in circumstances where normal banking accommodation is inappropriate or recourse to capital issue methods is impracticable." Its charter permits I.F.C. to finance public limited companies and co-operative societies which are registered in India and are engaged in the manufacture, preservation or processing of goods, shipping, mining, hotels, and generation or distribution of power and gas. Originally it was expected to finance manufacturing and processing enterprises only. Under a Central Government decision in 1970, public sector undertakings, which are set up as public limited companies, can also seek assistance from I.F.C. on the same basis as the private sector. Financial assistance on concessional terms, is available for setting up industrial projects in certain industrially less developed areas notified by the Central Government. I.F.C. finances not only new industrial projects but also renovation, modernization, expansion or diversification of existing enterprises only. The Corporation is required to "act on business principles due regard being paid to the interest of industry, commerce and the general public."

I.F.C. extends assistance to borrowers in various forms though, for a

long time, it practically confined itself to first mortgage loans repayable within a maximum period of 25 years (maturities generally being 12 to 15 years), normally upto one-half of the value of net fixed assets and/or secured by Government guarantees. It lends upto 65 per cent of the value of fixed assets in the case of co-operative industrial concerns and upto 60 to 65 per cent in other cases where the foreign exchange component is more than 60 per cent of total capital expenditure. In many cases, it has also insisted upon an unlimited guarantee from managing agents or key directors, but since 1964 this condition has been generally relaxed. Lately, it has accepted bank guarantees in lieu of mortgages. In addition, it could underwrite capital issues but took a number of years to enter this field. A series of amendments to its charter since 1957 have enabled it to guarantee deferred payments to suppliers and loans due from any eligible concern to a financing agency within or outside India, to convert loans into equity or invest in equity, and to disburse foreign currency loans obtained from any foreign or Indian financial institution.

Projects to be eligible for assistance must be part of the Five Year Plans and should have obtained (i) the necessary licence under the Industries Development and Regulation Act 1951; (ii) consent from the Controller of Capital Issues for issue of shares, debentures and mortgage loans; and (iii) preferably preliminary clearance from the Capital Goods Committee of the Government when the import of equipment is involved. Besides, the projects should be commercially viable, have sound management, and the sponsors themselves must provide a reasonable proportion of the finance needed, with a sound debt-equity ratio.

Loans are given for the purchase of new machinery, renovation or replacement of old machinery, construction of factory buildings, and purchase of land for factory sites. Finance is not available for purchase of raw materials. Inventory is not accepted as security. Loans for working capital or repayment of existing liabilities are given only in exceptional cases. The rate of interest on all rupee loans was 7 per cent per annum, with a rebate of 0.5 per cent for punctual servicing. Since July 1962, it was progressively raised and from December 1970, the rate has stood at 9% subject to  $\frac{1}{2}$ % rebate for punctual payment of principal and interest. Concessional rates are applicable to loans to small or medium size projects in areas notified by the Central Government as industrially less developed. The net rate of interest on foreign currency loans is slightly higher at  $9\frac{1}{2}$ % with the  $\frac{1}{2}$ % rebate.

**Ownership:** The Corporation has an authorized share capital of Rs. 10 crores of which Rs. 8.34 crores is paid up, comprising 20,000 shares of Rs. 5,000 each. The Government has guaranteed the repayment of the principal of share capital in the event of winding up the Corporation.

and also a dividend of 2.25 per cent per year on all the 10,000 shares issued till 1961, and 4 per cent per year on the additional share capital of 3.34 crores raised since then. Consequently, the shares are approved securities for trusts, banks and insurance companies. In 1953 and since 1957, the Corporation has paid dividends out of its own profits. The accumulated liability to the Government on account of the dividend subvention, *i.e.*, the difference between the dividend guaranteed by the Government and the profit available for distribution, in the earlier years was extinguished in June 1962.

The broad pattern of ownership of share capital is laid down by charter. Ownership is not open to individuals. Since June 1964, the pattern of ownership changed. I.D.B.I. together with the entire holdings of the Government and the Reserve Bank, has 50 per cent of total share capital.

At its inception, the intention was that the Government, directly and through the Reserve Bank, would have a minority participation in share capital. The subsequent nationalization of life insurance companies, and the Imperial Bank as well as the nationalization of 14 major banks in 1969 and the recent take over of General Insurance Companies (pending their nationalization) has given an overwhelming majority to the Government and other public sector entities. The management of the Corporation is autonomous, subject to certain safeguards and restrictions and policy directives from the Government, which powers have since been transferred to I.D.B.I.

**Management:** Management is vested in a Board of Directors, consisting of a full-time Chairman and four other directors appointed by the Industrial Development Bank, two directors nominated by the Central Government and two directors elected each by Scheduled Banks, insurance concerns, trusts etc., and co-operative banks making 12 directors in all. Initially, the Corporation had a leading industrialist as part-time Chairman, and a full-time Managing Director, who had long experience in banking. The change to the present set-up was made in 1955, to implement one of the recommendations of a committee of enquiry appointed by Parliament in 1952. Since 1955, the three successive Chairmen have been senior civil servants on loan from the Government. In 1970, the senior most officer of the Corporation was appointed Chairman, the first such appointment since the Corporation was set up. The Board is required to meet at least once in three months and actually meets once a month. In an emergency, such as an urgent need for additional assistance or early disbursement of a loan already approved or steps necessary to protect the Corporation's interest, the Chairman can exercise all the powers of the Board (this contingency arose only on a few occasions). The Corporation has six advisory

committees, one each for textiles, engineering, sugar, chemicals, jute and miscellaneous groups of industries, which help in appraising projects. The committees include persons who have specialized knowledge and experience of particular industries, and are drawn from the Government and the private sector.

I.F.C. has five branch offices and one sub-office in addition to the head office at New Delhi. Its accounts are audited by the Comptroller and Auditor General, besides two commercial firms of auditors elected by non-Government shareholders.

**Government Control:** Apart from the nomination of two directors, the Government had power under the original Act to give directives on questions of policy but was not to interfere in routine management. From 1948 through 1959, seven formal directives were received by the Corporation. In addition, it agreed in 1956 to a suggestion from the Government to extend special assistance to co-operative processing factories. Such assistance, almost wholly to co-operative sugar mills, account for nearly one fourth of its total net sanctions. The directives required the Corporation, among other things, to assist as far as practicable in the industrial development of backward areas, to require borrowing concerns to seek I.F.C. approval before declaring dividends above a certain limit, to keep generally a minimum margin of 50 per cent against fixed assets in making loans, to inform the Government regarding loans exceeding Rs. 50 lakhs to disclose the names of all borrowers, to minimize the time-lag between approval and disbursement of loans, and to seek prior Government approval for more than three loans to a single party or where the aggregate of loans to the party exceeds Rs. 1 crore and to "refer to the Ministry of Finance for orders" all cases where the total loans granted to "industrial concerns which are owned, managed or controlled by a closely connected group of industrialists exceed" Rs. 1 crore. The power to issue directives is now vested in I.D.B., and the limit of loans to individual concerns or groups without prior Government permission has been raised to Rs. 2 crores.

Apart from these policy directives, the general mechanism of planning and the presence of official representatives on the Board are conducive to co-ordination with Government policy. The Corporation makes use of Governmental machinery for the appraisal of projects but, in addition, makes objectives and detailed enquires on its own into the merits of each proposal. There is no record of political interference in its working. As a matter of public obligation, it has played an important role in the development of co-operative sugar factories.

**Operations:** The Corporation does not give rupee loans of less than Rs. 10 lakhs. This field is left by convention and agreement to State

financial corporations. There is no upper limit on loans but, as always stated, rupee loans exceeding Rs. 1 crore required prior approval of the Government till 1964; till 1961, such loans required a Government guarantee of repayment of principal in addition to other security. For large projects, I.F.C. can and does arrange for participation by other financial institutions such as I.C.I.C.I., the Life Insurance Corporation, banks, etc., and foreign agencies such as the Commonwealth Development Finance Company of the U.K.

From 1948 through June 1971, I.F.C. obligated assistance aggregating over Rs. 365 crores, disbursed nearly Rs. 319 crores. The total amount written off from portfolio, till 1956-57 amounted to Rs. 50 lakhs and

\*Includes direct subscription of Rs. 2.48 crores.

as revenue for doubtful debts. In 1970-71, administrative expenses came to only 3.5 per cent of gross income. Total net assistance sanctioned upto June 30, 1971 amounted to Rs. 365.67 crores covering in all 1,160 applications and 527 industrial projects. Disbursements added upto Rs. 318.76 crores of which Rs. 267.78 crores were in cash. The outstandings stood at Rs. 198.13 crores.

The total disbursement of Rs. 267.78 crores was financed as follows :

TABLE LXVIII  
Sources of I.F.C. Finance July, 1948 to June, 1971

|                                     | (Rs. in crores) |
|-------------------------------------|-----------------|
| 1. Paid up share capital            | 8.35            |
| 2. Reserves                         | 14.24           |
| 3. Repayments of loans, etc.        | 73.47           |
| 4. Loans from Government            | 77.32           |
| 5. Loans from Reserve Bank of India | 1.24            |
| 6. Foreign credits                  | 35.47           |
| 7. Bonds                            | 57.69           |
| Total:                              | 267.78          |

Repayment of Bond issues, principal and interest are guaranteed by the Government of India. The facility of loans from the Government as and when resources are headed has enabled the Corporation to minimize idle cash. Such drawing facilities would, apart from P.L. 480 funds, now be available from I.D.B.I. and not Government. In addition, it has a short-term overdraft arrangement of upto Rs. 3 crores at the Reserve Bank.

Under its charter, I.F.C. can borrow in rupees and incur contingent liabilities upto ten times its paid-up share capital and free reserves, and, in addition, raise long-term deposits of upto Rs. 10 crores, which it has not exploited so far. Foreign currency borrowings are outside the above mentioned ceiling but require prior Government approval.

**Foreign Currency Loans:** As the only institutional lender of long-term industrial finance till the setting up of new agencies after 1954, I.F.C. realized the need for a foreign currency loan soon after it was established. It approached the World Bank several times without success.

In August 1951, long before the foreign exchange position deteriorated, I.F.C. approached I.B.R.D. for assistance. The Bank sent a Mission in May 1952 to make a detailed study of the Corporation's working. The seventh annual report of I.B.R.D. (1951) stated that "In May 1952, Bank representatives carried on discussions of possible assistance to the Industrial Finance Corporation, a private institution for providing medium and long-term credit to industry. It is expected that negotia-

tions for a loan to the Corporation will begin soon." Most of the suggestions made by the Mission to improve its operations were accepted. Thereafter, I.B.R.D. agreed to open negotiations for a loan of \$8 million. In July 1952, the terms and conditions of the loan were finalized in Washington. Subsequently, the Corporation submitted 16 projects requiring foreign exchange for scrutiny and approval. At the end of 1952, the I.F.C. Act was amended in accordance with the I.B.R.D.'s suggestions. During the passage of the amending bill in Parliament, some members demanded an enquiry into the working of I.F.C. The Government and the World Bank thereupon agreed to defer the loan till after an investigation into the Corporation's affairs. In September 1955, a number of changes were made in the Corporation's charter, and a full-time Chairman was appointed. The World Bank had, in the meanwhile, actively sponsored the setting up of I.C.I.C.I. I.F.C.'s application was renewed in 1956 and negotiations were re-opened in March 1957. The prospect of securing a credit of \$10 million (against \$60 million requested) appeared bright at one stage but later (in 1957 or 1958) the negotiations faded out when I.B.R.D. indicated its intention to channelize its lending to the private sector exclusively through I.C.I.C.I.

In 1961, I.F.C. renewed its efforts to secure an I.B.R.D. loan but with no success. I.B.R.D. took the position that it could not finance two development banks in one country.

Failing I.B.R.D., I.F.C. turned to the U.S. Development Loan Fund, the only other foreign exchange lender at the time. Negotiations in 1960 resulted in an agreement being signed for a \$10 million loan. The loan requires the Government to be guarantor and primary obligator; it carries interest at 5 per cent per annum, and is repayable *in rupees* over 15 years.

The U.S. Agency for International Development successor to D.L.F., granted two times of credit aggregating \$26.88 million in 1961 and 1964.

TABLE LXIX  
I.F.C. Foreign Currency Loans Sanctioned upto June, 1971

| Currency       | No. of Sub-loans | Foreign Currency<br>(million) | Rs. Lakhs |
|----------------|------------------|-------------------------------|-----------|
| U.S. Dollars   | 57               | \$ 26.92                      | 1,976.52  |
| Pound Sterling | 3                | £ 0.12                        | 21.50     |
| West German DM | 103              | DM 105.04                     | 2,139.48  |
| French Francs  | 11               | Fr. 12.97                     | 177.48    |
| Total          | 174              |                               | 4,314.98  |

Note: These sub-loans were in respect of 157 applications.

Kreditanstalt, the West German Reconstruction Loan Corporation, has, beginning from 1961, given the Corporation nine loans totalling DM

112.5 million, the last credit given in 1970. The initiation for the first loan came from West Germany which allocated DM 15 million to I.F.C., out of DM 100 million extended to India in 1961. DM credits are fully convertible for purchase in U.S.A., Britain, West European countries and Japan.

The French credit of 7,715 million finalized at the end of 1962, was mostly intended for the import of capital of goods from France. A British loan of £1 million was secured in 1970 under the U.K. India Capital Investment loan, for the import of capital goods from U.K.

**Industrial Credit and Investment Corporation of India:** The Industrial Credit and Investment Corporation of India was registered as a public limited company in 1955. The idea of setting up a private development bank originated with the U.S. aid mission which wanted to place P.L. 480 counterpart funds with a private agency but could not make much progress perhaps, due to the lukewarm attitude of the Government of India. The idea crystallized only when I.B.R.D. came into the picture in 1954. I.B.R.D. took over the informal steering committee of top Indian businessmen, which the U.S. aid mission had set up earlier. The committee was later transformed, with some additions, into the Board of Directors of the Corporation. The status of its members, sponsorship by I.B.R.D., and the selection of a British financial expert to head the management for some years, helped the new institution to secure participation in share capital from the Commonwealth Development Finance Company and British banks, as well as Bank of America, Westinghouse Corporation, Rockefellers, and Olin Mathieson.

Its memorandum states that the object of I.C.I.C.I. is to carry on the business of assisting industrial enterprises within the private sector of industry in India in general by assisting in the creation, expansion and modernization of such enterprises; (ii) encouraging and promoting the participation of private capital, both internal and external, in such enterprises; (iii) encouraging and promoting private industrial investments and the expansion of investment markets: and in particular by (a) providing finance in the form of long or medium-term loans or equity participations; (b) sponsoring and underwriting new issues of shares and securities; (c) guaranteeing loans from other private investment sources; (d) making funds available for reinvestment by revolving investments as rapidly as prudent, and (e) furnishing managerial, technical and administrative advice and assisting in obtaining managerial, technical and administrative services to Indian industry.

I.C.I.C.I. gives financial assistance to joint stock companies for the purchase of capital assets through (a) underwriting of public and private issues and offers of sale of industrial securities, (b) direct subscription to securities, (c) rupee loans upto one-half the net value of fixed assets

(secured by first mortgage)\* repayable over periods upto 15 years, (d) foreign currency sub-loans out of I.B.R.D. and other foreign exchange credits to finance import of capital equipment and technical services, and (e) guarantee of loans made by other institutions, domestic or foreign.

Originally, there were no limits with respect to the amount of assistance to individual concerns, but later a lower limit was fixed at Rs. 500,000 and an upper limit at Rs. 1 crore; the latter limit applies to foreign currency sub-loans to a group of closely affiliated companies as well. I.C.I.C.I. can and does, nevertheless, help borrowers to get larger amounts by securing the co-operation of other financing institutions, both Indian and foreign. This co-operation is sought, in fact, even for modest amounts. In other words, I.C.I.C.I. is prepared to consider any proposal from anybody, provided the promoters make a substantial contribution to the total resources required, and the enterprise has or promises to obtain experienced management and expert technical personnel or advice. Sometimes, it appoints a director on the board of the borrower to safeguard its interests, but it does not seek participation in management; but this has since been modified under a directive from the Government of India referred to earlier in pursuance of the recommendation of the Licensing Policy Inquiry Committee.

I.C.I.C.I. turns over its investments to recoup liquidity and to promote wider distribution of ownership, but it does not give any commitment to the promoters regarding maintenance of market value or timing and amount of sales of holdings. The rate of interest at the end of 1964 was 7 per cent on rupee loans and 8 per cent on World Bank sub-loans. Besides, in many cases, it takes participation in profits, if the borrowing concern is narrowly owned, or retains the right to convert loans into equity if the borrower is widely owned. This policy has been extended to a few foreign currency sub-loans also.

Applications for all forms of assistance, including guarantees and underwriting, undergo a process of detailed and thorough appraisal which goes into the background of the company or promoters, basic soundness of the project, total cost and means of financing the entire project, market prospects, profitability, management, and Government consents.

As mentioned earlier, I.C.I.C.I. has a paid up share capital of Rs. 7.50 crores. Its authorized capital is Rs. 25 crores. It is the only long-term financing institution in India with foreign shareholders from the U.K., U.S.A. and West Germany.

The West German banks became shareholders by acquiring part of the U.S. interest. The capital subscriptions of the foreign shareholders

---

\*This limit has been relaxed in favour of a few projects which had a high foreign exchange component, which provided a bank guarantee in addition to other security, and were expected to have satisfactory earning capacity.

were surrendered to the Reserve Bank and are not, therefore, available for foreign currency loans. Their rupee equivalent is part of the total resources available for assistance.

**Management:** The management of the Corporation is vested in a Board of Directors, which consists of a Chairman, a Deputy Chairman who is also Managing Director and 12 other directors, of whom one is a Government director and one each represents British and American shareholders. The Government is entitled to nominate a director so long as its loans remain outstanding. Another Government Director is elected. Since 1970 the L.I.C. represented on the Board. The I.C.I.C.I. has decided to have on its board a representative of the nationalized banks.

Nearly all the directors are well-known top industrialists and financiers. Some reshuffling was done in 1958, it is believed, at the initiative of I.B.R.D., to make the Board more broad-based. The Chairman does not have any emergency powers to approve assistance and can only authorize implementation of the Board's decisions.

In appraising various projects, particularly those in new industries like organic chemicals, the Corporation takes the advice of outside experts or advises borrowers to employ consultants, if they do not have a really satisfactory foreign technical collaboration. Routine projects are processed by the Corporation's own technical appraisal division. It has no advisory committee. Apart from the Head Office in Bombay, the I.C.I.C.I. has two regional offices in Calcutta and Madras.

The Government has no powers of control over the Corporation, apart from the right to nominate a director and to intervene in the event of a substantial redistribution of equity ownership and/or impairment of share capital. As with the several other development banks promoted by it, I.B.R.D. exercises a degree of supervision through periodical appraisals and suggestions for improvement. In 1958, I.B.R.D. loaned one of its top experts to advise and assist I.C.I.C.I. for some time.

**Operations:** From 1955 through December 1970, I.C.I.C.I. obligated assistance of Rs. 295.69 crores in 975 operations. disbursed Rs. 201.13 crores. The assistance has been fairly widely distributed geographically, but there is some concentration in a few states.

The largest single foreign currency loan of Rs. 1 crore was given with prior I.B.R.D. approval to Scindia Steam, the biggest shipping company in India, for the purchase of ships. Normally, I.C.I.C.I. seeks the participation of other institutions in giving a loan of this size, but made an exception in this case. Since then 14 companies have been given similar loans.

TABLE LXX

State-Wise Distribution of Financial Assistance since Inception upto Dec. 1970

| <i>State or Territory</i> | <i>No. of Coys.</i> | <i>Net Sanctions</i> | <i>%age to total sanctions</i> |
|---------------------------|---------------------|----------------------|--------------------------------|
| Andhra Pradesh            | 14                  | 1,082                | 3.7                            |

In initial years, the demand for foreign currency loans was slack because imports of capital equipment were being financed out of free foreign exchange and, for some time thereafter, under deferred payment arrangements. The demand for underwriting and share capital participation, on the other hand, was relatively brisk, except in 1957. Since 1958, demand for both foreign currency and rupee loans has picked up. Until I.F.C. got a D.L.F. loan, and received permission to take up equity, I.C.I.C.I. was the only lender of foreign exchange and the only institution that could offer a comprehensive package of different forms of assistance. Even now though I.F.C., I.D.B. and the Unit Trust have entered the field, I.C.I.C.I. remains pre-eminent as underwriter and lender of foreign exchange.

The Corporation has operated profitably. A dividend of 10 per cent

| 5.     | I.D.B.I. loans            | 12.30  |
| 6.     | Foreign currency loans    | 173.41 |
| Total: |                           | 243.85 |

was declared in 1970. As at the end of 1970, its interest rates were 8½ per cent on rupee loans and 9 per cent on foreign currency loans.

The first Government loan, advanced to I.C.I.C.I. in 1955, was for Rs. 7.5 crores free of interest, for 30 years, repayable in 15 annual instalments beginning in 1970. It is subordinate to all liabilities and equity. The second Government loan, Rs. 10 crores given in 1959 out of P.L. 480 funds, carries interest at 4½ per cent per annum on amounts drawn and outstanding, repayable over 20 years, in 10 annual instalments commencing 10 years after withdrawal. This loan is subordinate only to I.B.R.D. loans. These two rupee loans were fully utilized by the end of 1963. It secured a third loan of Rs. 10 crores, from P.L. 480 funds, in 1964, of which Rs. 7.5 crores was drawn during the year. In June 1965, it received Government permission to raise the share capital by Rs. 2.5 crores to Rs. 7.5 crores.

**Foreign Currency Loans:** As the institution providing the largest amount of foreign currency loans to the private sector, I.C.I.C.I. has in the last 15 years since inception had received 20 loans of foreign credit totalling the equivalent of \$231.21 million (Rs. 173.41 crores). This is made up of eight World Bank credits aggregating \$199.39 million (Rs. 149.55 crores), one U.S.AID loan of \$4.48 million (Rs. 3.36 crores), nine loans of DM 82.50 million (Rs. 16.90 crores) from Kreditanstalt of West Germany and one for £2 million (Rs. 3.60 crores) from the United Kingdom.

Sub-loans granted out of these credits are stated in the Table below:

TABLE L IV

(Rs. in crores)

|               | <i>Amount<br/>Sanctioned<br/>(Rs.)</i> | <i>Amount<br/>Disbursed<br/>(Rs.)</i> |
|---------------|----------------------------------------|---------------------------------------|
| I.B.R.D.      | 152.01                                 | 105.40                                |
| Kreditanstalt | 13.92                                  | 11.87                                 |
| U.S.AID       | 3.35                                   | 3.35                                  |
| U.K.          | 1.46                                   | —                                     |
| <b>Total:</b> | <b>170.74</b>                          | <b>120.62</b>                         |

I.B.R.D. loans are freely convertible but the others are tied to purchases in the creditor countries.

The pre-conditions of the first I.B.R.D. loan were that the Government would give a rupee loan of Rs. 7.5 crores subordinate to all liabilities and equity capital, and that Rs. 5 crores of ordinary share capital would be subscribed by private investors in and outside India. The second loan given in 1959 was conditional upon another Government loan of Rs. 10 crores subordinate only to I.B.R.D. loans.

The loans are utilized for re-lending to private concerns to finance exclusively the foreign exchange costs of approved projects. The security of sub-loans is to be duly safeguarded by I.C.I.C.I. Both the borrower and the sub-borrower are accountable to I.B.R.D. for proper utilization of the loan. Individual sub-loans out of the first loan required prior I.B.R.D. approval in each case. In the second loan, however, I.C.I.C.I. was allowed to relend to any single project upto \$100,000, with an aggregate free limit of \$1 million, without prior I.B.R.D. approval. These free limits were raised in subsequent loans.

**State Financial Corporations:** After the setting up of the Industrial Finance Corporation to assist the growth of large public limited companies and industrial co-operatives, it was realized that there was need for similar institutions to finance medium and small scale enterprises

and that such institutions could best be set up on a statewide basis. Accordingly, the State Financial Corporation Act was passed in 1951 and it came into force in August 1952. Under this Act, each State except Tamil Nadu has set up a financial corporation. In Tamil Nadu, the Madras Industrial Investment Corporation (M.I.I.C.) established in 1949 as a joint stock company, is deemed to be the State financial corporation. It is now known as the Tamil Nadu Industrial Investment Corporation after the State was renamed in 1969.

The genesis of S.F.C.s goes back to the Central Banking Enquiry Committee which, among other things, reviewed the working of the State aid to Industries Act then in operation in a few provinces. While not ruling out the setting up of an All India Industrial Corporation under the Central Government, it recommended (in vague terms) the establishment of Provincial Industrial Corporations, with limited assistance from Provincial Governments in the form of guarantee of interest on the first issue of their debentures. The initial move in this direction was, however, made by the Tamil Nadu Government when, in consultation with the Reserve Bank, it set up M.I.I.C. under the Companies Act in 1949. In the same year, Bombay and Punjab sought to have State counterparts of I.F.C. and requested the Centre to enact suitable legislation for the purpose, in order to incorporate special provisions in the charters of the provincial bodies. The first S.F.C. registered under the Act was in Punjab in February 1953. By 1960 twelve states had established their finance corporations.

As at the end of October 1971, there were 18 S.F.C.s. one for each state plus one for the Union Territory of Delhi. The Tamil Nadu Industrial Investment Corporation function as the S.F.C. in the State. other Union Territories, Chandigarh is served by Delhi, Goa, Daman As for and Diu by Maharashtra, Dadra and Nager Haveli by Gujarat, Pondicherry by Tamil Nadu and Manipur and Tripura by Assam which is also expected to cover Nagaland. It is likely that the jurisdiction of the West Bengal S.F.C. will be extended to the Andaman and Nicobar Islands.

S.F.C. have so far opened 43 Regional or Branch Offices which have led to increase in business. More such offices would be necessary for building up more and new *entrepreneurs* and for encouraging the development of industries in relatively under-developed areas.

Under the statute, the funds of State Governments and the Reserve Bank are employed in these institutions as share capital and debentures but their ownership is also open to the public, financial institutions, etc. The states have guaranteed a minimum dividend on their share capital and have also guaranteed the principal and interest of their debenture issues as well as the principal of deposits from the public; they have a large say in their management through nomination of directors.

issue of directions, employment of senior personnel etc. S.F.C.s can lend only to industrial concerns, which are defined to exclude housing, trading certain service industries, plantations, etc. The maximum assistance to individual units was at first restricted to 10 per cent of each S.F.C.'s share capital subject to a maximum of Rs. 10 lakhs but was raised in 1962 to Rs. 29 lakhs for public limited companies or co-operatives and Rs. 10 lakhs for others. The minimum has remained constant at Rs. 1 lakh. Security requirements are strict — generally a margin of 50 per cent — though these have been relaxed of late. A series of amendments in 1956 and 1962 relaxed many of the restrictions: S.F.C.s. are permitted since 1962 to underwrite share and debenture issues and retain such investments beyond 7 years with prior Reserve Bank permission, extend guarantees or lend against specified guarantees and to borrow from the Reserve Bank. As a result of the amendments, the Reserve Bank has acquired greater control over their working. They can also seek refinance from the Industrial Development Bank. Refinance facilities are liberal and in recent years there has been increasing reliance on I.D.B.I.

The authorized capital of each S.F.C. has to be between Rs. 50 lakhs and Rs. 5 crores and the States decide on the distribution of ownership between themselves, the Reserve Bank, scheduled banks, insurance companies, investment trusts, co-operative banks and others, the last mentioned not to own more than 25 per cent. The intention is that the States and the Reserve Bank together should have the majority ownership.

TABLE LXXV  
S.F.C.s' Sources of Finance as at end of Sept., 1971

|        |               | Rs. in crores |
|--------|---------------|---------------|
| 1.     | Share capital | 22.08         |
| 2.     | Reserves      | 6.60          |
| 3.     | Bonds         | 74.48         |
| 4.     | Deposits      | 8.82          |
| Total: |               | 111.98        |

According to the statements of assets and liabilities as in July/August 1971, the S.F.C.s may be classified under four categories. Two—Maharashtra and Tamil Nadu have resources exceeding Rs. 20 crores. The resources of the S.F.C.s of Andhra Pradesh, Gujarat and Karnataka are between Rs. 10 crores and Rs. 20 crores. Seven S.F.C.s—those of Haryana, Kerala, Madhya Pradesh, Punjab, Rajasthan, Uttar Pradesh and West Bengal — between Rs. 7 crores and Rs. 10 crores. The resources of the remaining six Assam, Bihar, Delhi, Himachal Pradesh, Jammu and Kashmir and Orissa are below Rs. 5 crores. These figures reveal that the growth of business of the S.F.C.s has been uneven.

**Resources:** Of the total paid up share capital of Rs. 22.08 crores, the State Governments contributed Rs. 11.48 crores (about 52 per cent). The share of the Reserve Bank and the I.D.B.I. was Rs. 4.47 crores (20%). The balance was contributed by scheduled banks, the L.I.C. and others.

In order to augment the capital of S.F.Cs., the Reserve Bank in 1970 suggested the private issue of the required capital of each S.F.C. to be subscribed by the State Government and the I.D.B.I. on a 50 : 50 basis and at a minimum guaranteed dividend of 3½ per cent. Accepting the suggestion, Gujarat and Maharashtra S.F.Cs. have raised their capital of Rs. 71 lakhs. Four more S.F.Cs. are expected to follow such to the extent of Rs. 1.4 crores in the aggregate.

The total reserves of the S.F.Cs. amounted to Rs. 6.06 crores or 24 per cent of their aggregate paid up capital as at the end of September 1971. The reserves were made up as follows:

TABLE LXXVI

|    |                            | Rs. in crores |            |
|----|----------------------------|---------------|------------|
|    |                            | Amount        | % to total |
| A. | 1. General reserve         | 0.75          | 12         |
|    | 2. Special reserve fund    | 1.40          | 23         |
|    | 3. Special reserve account | 2.98          | 49         |
|    | 4. Other reserves          | 0.93          | 16         |
|    |                            | 6.06          | 100        |
| B. | Total paid up capital      | 22.80         |            |
|    | %age of A to B             | 24            |            |

The reserves increased by Rs. 2.95 crores since the end of March 1969. These are inadequate in relation to, among other factors, their paid up capital and the long period (over ten years) most of them have been in business.

Bond issue has been one of the important resources of the S.F.C.s. The value of bonds outstanding through September 1971 was Rs. 74.48 crores representing 45 per cent of their resources. The bonds are guaranteed by the State Governments. Some State Governments have given exemption to the S.F.Cs. from payment of stamp duty and guarantee commission on the bonds while others have not. The Reserve Bank has been trying to sort this out in consultation with the State Governments concerned.

Refinance from I.D.B.I. has been on the increase in the last two years. Aggregate refinance outstandings increased from Rs. 19.8 crores at the end of March 1969 to Rs. 35.5 crores at the end of August 1971. This has been possible because of the concessional fee was offered by I.D.B.I.

Also there has been considerable relaxation of procedures. The re-finance scheme makes it possible for I.F.Cs. to provide financial assistance to small industries and those in backward areas at concessional rates of interest.

As at the end of March 1969, the outstanding balance of refinance of each of a S.F.Cs. exceeded Rs. 50 lakhs. As through September 1971, fourteen S.F.Cs. were in this category.

At the end of August 1971, deposits of 11 S.F.Cs. aggregated Rs. 13.24 crores. Of this the Tamil Nadu Corporation alone accounted for Rs. 8.82 crores. Except for two or three deposits have not been a significant source of funds for S.F.Cs.

The total net profit (before making provision for income tax) of the 18 institutions amounted to Rs. 3.08 crores in 1970-71. In the previous two years the figures were Rs. 2.47 crores and Rs. 2.62 crores. As a percentage of the total paid up capital and revenues, the net profit formed 10.2, 10.4 and 11.4 for the last three years. In relation to the level of profits of S.F.Cs. in 1964-65, their profits for 1970-71 were more than doubled in most cases.

The level of profits has not been adequate to enable S.F.Cs. to undertake monetarial functions or build up a satisfactory level of reserves. This is mainly due to the fact that the rate of interest charged on their borrowers, mostly small and medium scale industries, are lower than the prevailing market rates. On the other hand, they pay the ruling

TABLE LXXVII

Capital and Working Funds of S.F.Cs. (as at end of March, 71)

| Rs. in lakhs |                            |                    |                  |                                          |
|--------------|----------------------------|--------------------|------------------|------------------------------------------|
| No.          | State/<br>Territory        | Paid-up<br>capital | Working<br>funds | % of paid-up capital<br>to working funds |
| 1.           | Andhra Pradesh             | 150                | 1,153            | 13                                       |

| 10.          | Madhya Pradesh             | 100                | 750              | 13                                       |
| 11.          | Maharashtra                | 175                | 2,472            | 7                                        |
| 12.          | Karnataka                  | 100                | 878              | 11                                       |
| 13.          | Orissa                     | 100                | 414              | 24                                       |
| 14.          | Punjab                     | 75                 | 575              | 13                                       |
| 15.          | Rajasthan                  | 100                | 560              | 18                                       |
| 16.          | Uttar Pradesh              | 185                | 860              | 22                                       |
| 17.          | West Bengal                | 100                | 846              | 12                                       |
| 18.          | Tamil Nadu (Madras) I.I.C. | 300                | 2,608            | 12                                       |
| Total:       |                            | 2,097              | 15,480           |                                          |

rates for long term funds to raise the money for their operations. Figures for the last three years 1968-71, show that the spread between the cost of raising resources and return of the S.F.Cs. was between 2 and 3 per cent. In a few, it was higher still.

**Loan Operations:** Total loans outstanding at the end of September 1971 amounted to Rs 137 crores. In 1969, it was Rs 92 crores and in 1970, Rs 107 crores.

Region-wise S.F.Cs. in the western region accounted for 32 per cent of the total outstandings. The southern region came next with 31 per cent, the northern region 22 per cent and the eastern region 15 per cent. Progress in the western and southern region has been impressive while that in the northern region has been picking up. The eastern region has been lagging behind.

Industry-wise classification of loan and advances outstanding shows that a greater share of recent assistance by S.F.Cs. has been extended to the more modern and sophisticated lines such as chemicals, iron and steel, machinery other than electrical machinery etc.

The share of small industries in the loans and advances of S.F.Cs. increased from Rs 23 crores (25% of total) at the end of March 1969 to Rs 57.67 crores (42% of total) at the end of September 1971.

Seven institutions, Bihar, Haryana, Maharashtra, Karnataka, Orissa, Tamil Nadu and Uttar Pradesh have introduced special schemes for assistance to *entrepreneurs*/technicians offering them credit as soft terms. S.F.Cs. in Madhya Pradesh, Haryana, Jammu and Kashmir, Maharashtra, Karnataka, Orissa, Rajasthan, Tamil Nadu and Uttar Pradesh have similar schemes of assistance to units to be set up in the backward areas.

Underwriting of shares of industrial concerns of S.F.Cs. has not been significant. Except in one or two cases, the entire shares underwritten have desolved on the S.F.Cs. The investment through underwriting operations (and in the case of Tamil Nadu, through direct subscription as well) amounted to Rs 10 crores at the end of March 1971.

In the field of loan guarantees by S.F.Cs., progress has been unimpressive and the record so far shows that this field of business has yet to level up significantly. In 1970-71, outstanding loan guarantees amounted to Rs 6.47 crores. In the earlier two years, the figures were Rs 4.46 crores and Rs 5.46 crores.

**Inter-Institutional Co-ordination:** The S.F.Cs. were set up mostly in the early fifties, to overcome the difficulties of industries in finding adequate credit at reasonable terms, for their development. The situation changed in the sixties when Government and the Reserve Bank reoriented their policies and strengthened the institutional arrangements for term credit to the industrial section. Further the interest rate policy helped the

growth of long term deposits with banks. The setting up of the Re-finance Corporation and later the I.D.B.I. encouraged commercial banks to grant term loans without fear of their liquidity being impaired. The banks went all out to lend to the small scale sector. The immediate impact of all this was a reduction in the number of loan proposals received by the S.F.Cs. which had so far not faced any serious competition. Negotiations were held between the banks and the corporations leading to the evolution of participation arrangements. Under these arrangements there was a large scope in financing new projects, through Corporation in credit appraisal, recovery of loans, inspection of units and in desiring schemes of rehabilitation of units in difficulties. The follow-up action on these negotiations was not very encouraging for only a few S.F.Cs. considered it worthwhile to enter into participation arrangements with banks. Even in these cases the scope for participation was limited and inadequate. Many S.F.Cs. feel the arrangements are tilted in favour of the banks. An arrangement in depth under which all the three parties the banks, the S.F.C., and the borrowing unit will have a complementary and co-operative role is yet to be evolved.

**State Industrial Development Corporation:** Most of the states have established State Industrial Development Corporation. Besides, in Maharashtra, Gujarat and Tamil Nadu, there are State Industrial Investment Corporations (S.I.I.C.).

The S.I.D.Cs. most of them formed around 1961, are essentially the result of frustration with the limited functions and moderate success of the S.F.Cs., particularly their viability to sponsor and promote industrial enterprises. They have been established more on State than Central initiative and represent the desire of the States to play a more active role in the promotion and growth of large scale industries. All these aspirations are exclusively State financed.

The Memoranda of Association of these Corporations empower them to undertake a wide range of functions such as underwriting of and direct subscription to shares and debentures of industrial concerns, making loans and advances to them, providing infra-structure facilities including development of land etc. In practice, however, each Corporation restricts itself to a few major activities, keeping before it the primary objectives with which the Corporation was set up.

For example, in Maharashtra and Gujarat, the S.I.D.Cs. are concerned with the question of recovering the concentration of industries in the metropolitan areas.

In Kerala and Andhra Pradesh, the Corporations are engaged in promoting and participating in industrial projects jointly with private parties. In Bihar and Orissa, industrial projects are promoted, set up and managed in the public sector. Several S.I.D.Cs. extend loans and

advances to industrial concerns and also lend support to their capital issues. They also provide guarantees on behalf of industrial concerns.

All S.I.D.Cs. and S.I.I.Cs. except three, Andhra Pradesh, Haryana and Uttar Pradesh grant term loans to industrial units. All of them except Jammu and Kashmir and Punjab handle underwriting of shares and debentures of industrial concerns. Deferred payment guarantees have been given by the S.I.D.Cs. of Andhra Pradesh, Kerala, Karnataka and Tamil Nadu and by the Gujarat Industrial Investment Corporation (G.I.I.C.) and the State Industrial Investment Corporation of Maharashtra.

This shows that there is considerable scope for overlapping of functions between these institutions on the one hand and the S.F.Cs. on the other. The Reserve Bank has been advising against such overlapping. It has suggested S.I.D.Cs. and S.I.I.Cs. should consider proposals only when the S.F.Cs. are unable to grant the facilities.

TABLE LXXVIII  
Loans Sanctioned By S.I.D.Cs./S.I.I.Cs.

|                            |              |                     |                        | Rs. in lakhs                             |
|----------------------------|--------------|---------------------|------------------------|------------------------------------------|
| <i>S.I.D.C./S.I.I.C.</i>   | <i>As on</i> | <i>No. of units</i> | <i>Limits sanction</i> | <i>Average limit sanctioned per unit</i> |
| 1. Karnataka I.I.D.C.      | 31.3.1970    | 9                   | 154.48                 | 17.16                                    |
| 2. S.I.I.C. of Maharashtra | "            | 38                  | 710.93                 | 18.71                                    |
| 3. West Bengal I.D.C.      | "            | 19                  | 67.04                  | 3.53                                     |
| 4. Bihar S.I.C.            | 31.3.1969    | 11                  | 11.12                  | 1.01                                     |
| 5. Gujarat I.I.C.          | 30.4.1970    | 756                 | 1,316.53               | 1.82                                     |
| 6. Kerala S.I.D.C.         | 31.3.1970    | 9                   | 79.75                  | 8.86                                     |
| 7. Madhya Pradesh I.I.C.   | 31.3.1968    | 2                   | 13.80                  | 6.90                                     |

The above Table shows that the average size of the loans in the case of Maharashtra was Rs. 19 lakhs and in the case of Karnataka Rs. 17 lakhs. They are an indication that the two corporations had assisted units which could not have been financed by the S.F.Cs. The Maharashtra Corporation has a participation scheme with the Maharashtra S.F.C. in terms of which loans are granted jointly by the two organizations. In fact S.I.C. of has similar arrangements with banks as well.

The average amount of loans granted by the S.I.D.C. of Bihar was as low as Rs. 1.01 lakhs, Maharashtra by S.I.D.C. of West Bengal was Rs. 3.53 lakhs and that of the Gujarat I.I.C. was Rs. 1.82 lakhs. Indications are that these three corporations provided bulk of their assistance to small and medium sized units which are eligible for S.F.C. assistance. The Gujarat Industrial Investment Corporation has since taken a decision that financial assistance by way of term loans should be promoted by the S.F.C. and G.I.I.C. would underwrite a part of the public issue of the capital if any and/or make up the balance of the financial assistance required after a unit has granted itself of the maximum facilities from other financing agencies.

In other States, it is possible that some units would have obtained assistance from S.I.D.C. and S.I.I.C. as well as from S.F.C. It is obvious that there should be a clear understanding of the distinctive role of each institution. The I.D.B.I. has recently set up a working group to examine the role and performance of State Financial institutions with particular reference to S.I.D.Cs. and S.I.I.Cs. so that their functions are integrated with the structure of development banking in the country.

**S.F.Cs. and All India Finance Institutions:** I.F.C.I. and I.C.I.C.I. are all India term lending institutions. Under the statute, I.F.C. can provide financial assistance only to public companies and cooperative societies. Generally I.F.C. finance, medium and large units. The S.F.Cs, on the other hand can assist all categories of units viz. proprietary, joint family and partner- ship concerns, private and public limited companies and co-operative societies. The maximum amount of loan together with the loan guarantees which can be given to any one concern should not exceed Rs. 20 lakhs in the case of a public company, or co-operative society and Rs. 10 lakhs in other cases. There have been occasions when S.F.Cs. have offered assistance to units which should really have been provided only by the I.F.C. In some cases S.F.Cs. had tried to overcome the statutory limitation on loans by offering deferred payments guarantees for which there is no ceiling per unit.

In order to bring about co-ordination between the S.F.Cs. and I.F.C., the I.F.C. has been given the right to nominate a Director on the Board of Directors of each S.F.C. The I.F.C. nominee ensures that proposal for large projects received by S.F.Cs. are passed on to I.F.C. for consideration. If the S.F.C. desires, it may be allowed to participate in the transactions to a small extent. This would ensure that projects are scrutinized properly and the concern would be subject to satisfactory financial discipline. In the event of over run of costs, I.F.C. would be in a position to reassess the requirements of the unit and arrange for necessary resources.

I.C.I.C.I. deals entirely with corporate bodies in the large scale sector. Also a large part of its assistance is in foreign currency. I.C.I.C.I. provides foreign currency loans to small units including partnership and proprietary concerns in participation with local financing institutions. However S.F.Cs. do not seem to have taken advantage of such facilities to any significant extent.

L.I.C. assists S.F.Cs. mainly by subscribing to their bonds. S.F.C. bonds held by L.I.C. as on 31 March 1970 totalled about Rs. 20 crores forming 33.3 per cent of the total outstanding bonds of S.F.Cs. as on that day at Rs. 60 crores. As a shareholder L.I.C. has a Director on each S.F.C. In turn, the S.F.Cs. place the bulk of their general insurance with L.I.C.

The Reserve Bank, the I.F.C. and the L.I.C. each have a nominee on the Board of Directors of every S.F.C. A public sector bank is also re-

presented on each S.F.C. However, there is little consultation among these directors about the business of S.F.Cs. This lacuna is to be remedied soon.

S.F.Cs. have been the victims of a vicious circle which began with guaranteed dividends, inadequate resources, absence of tax concessions till 1962, excessive concern with the security and cover offered by borrowers instead of the prospects of the projects to be assisted, and lack of competent staff or outside experts to appraise applications. The dividend subventions received from States have been less than the dividends actually paid to State Governments and the Reserve Bank; dividends to these shareholders are being impounded in special reserves only since 1962. Unlike I.F.C. and I.C.I.C.I. they have not received any cheap and plentiful P.L. 480 funds, while the interest rates which they can charge to borrowers have been kept low as a matter of public policy. Where Governments have agreed to subsidize the low interest rates, the subsidies have been inadequate, partial and delayed.

Statutory restrictions on their working have also been a severe handicap, directly, by narrowing the range of operations and, indirectly, by encouraging subservience to the letter of the law. The ceilings on and floors to the amount of individual loans are such that, in many States, they practically exclude most new industrial activities; underwriting and direct subscription were nearly impossible till 1962 (as for I.F.C. till 1957) and even now they can be undertaken, by and large, only in participation with national institutions, which alone can provide the complementary foreign exchange loans. Dependence on Government personnel for top staff and appraisal of project applications has, among other things, imported attitudes born out of the experience of giving taccavi loans to landowners. The inability of most small borrowers to provide first class or conventional security and to incur the costs of documentation have further come in the way. More recently, the increasing interest of States in S.I.D.Cs. has also served to weaken the potential growth of S.F.Cs.

All these handicaps and problems notwithstanding, the record of S.F.Cs. can be considered as one of moderate success. They could have done better but the record so far certainly does not indicate total failure.

**Refinance Corporation for Industry:** The Refinance Corporation for Industry was a joint stock company owned by the Reserve Bank, the Life Insurance Corporation, the State Bank of India, and other leading banks. It was set up in 1958 to provide medium-term assistance to medium sized industries through the rediscount of 3 to 7 year bills drawn by member banks. It had total resources of Rs. 31 crores, consisting of share capital of Rs. 5 crores and loan funds of Rs. 26 crores from Government out of P.L. 480 funds at a nominal rate of interest. The rate of interest on the actual amount borrowed was  $1\frac{1}{2}$  per cent
